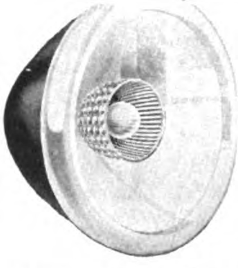
Accessories For Ford Cars



Stewart V-Ray Spark Plug $1

Stewart Lens Per Pair $2

The Stewart line of accessories for Ford cars represents a big opportunity for dealers.

Too many dealers overlook this big field. There are nearly 2,000,000 Ford cars in use today. Think of the thousands of Stewart Speedometers, Searchlights, Signals, Autoguards, etc., you could sell to these Ford owners if you would only go after the business.

Every Ford car should be equipped with Stewart Accessories. At the very least they should have a Stewart Speedometer and Instrument Board.

All it takes is a little effort on your part. If you will only take the trouble to look over the Ford cars that come to you—note the accessories that are lacking. Then tell the owner a few of the reasons why he should have a Stewart Speedometer, Searchlight, Autoguard, and so on. The results from this little effort will surprise you. And, if you go after the business with some enthusiasm and determination, you will soon realize a very handsome profit from the sale of Stewart Accessories.

Other dealers are doing this—why shouldn't you?

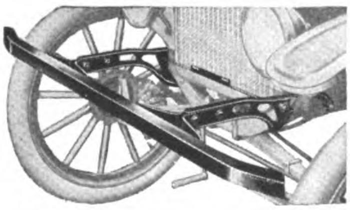
The Stewart Accessories are the easiest line to sell. They are so well known, so extensively advertised that they are already half sold before you stock them.

Nearly every Ford owner would buy more accessories if you—the dealer—would make it easy for him to get them. The only way is to carry a stock so you can show them to your prospects. But don't stop there. Show the accessories. Tell the car owners why they should have them. That is the way to bigger business and better profits.

Stewart Warning Signal Hand Operated $4.50
(Motordriven type $7.50)

Stewart Automobile Accessories are sold by leading accessory dealers, jobbers and garages—everywhere.

Stewart-Warner Speedometer Corporation
CHICAGO, U. S. A.



Stewart Autoguard for Ford Cars $10
With Nickel Channel Bar, $11.00

Stewart Speedometer and Instrument Board for Ford Sedan and Coupelet models. Price Complete. $15

France's Post-War Automobile Program

Industry Disturbed Over Import Duties—Plants Greatly Expanded But Unable to Get Into Quantity Production for Some Time—Types of Cars Reduced—Preference for Vertical Six—Small Four to Be Most Popular—Expect Big Tractor Development

By W. F. Bradley

THE armistice, coming much quicker than was ever thought possible, found the French automobile industry generally ill-prepared for normal business. There are two dominant questions troubling the leaders: The first is what import duty will be established by France and the other, whether England will depart from its free trade policy.

For over a year there has been a 70 per cent ad valorem import duty on automobiles and parts brought into France. This, however, was admittedly a temporary war measure, the ordinary duty being on a weight basis and being roughly equivalent to 10 per cent on the price of the machine.

French manufacturers would like to see this 70 per cent duty continued for one year after the signature of the peace terms, to be followed for a period of one year by 50 per cent, then 20 per cent. This protection is obviously directed against America, the only nation in a position to make quick deliveries of automobiles.

While anxious to get a protective wall for themselves, the French trade is nervous less England put up a protective tariff. The anxiety can be understood, when it is remembered that France, before the war, was the biggest motor exporting nation in the world, with a value of $45,000,000 in 1913, and that it was in England or through England that the greatest volume of business was transacted.

Now the English motor industry—which must not be confused with the English nation—is just as anxious to get protection as are the French automobile manufacturers. And this protection is desired primarily against America.

There are all kinds of scares abroad in France to show the necessity of a protective tariff. The latest is that the British and the American Governments have stipulated that none of their automobiles, sent over for war purposes, shall be allowed to return to the country of their origin. There is not a grain of truth in the whole thing, for the English are preparing to receive all their war worn trucks from France, and the Motor Transport Corps of the American Army is arranging to ship across the Atlantic all such vehicles as are worth returning. This is known to the scare-mongers, but they have not taken the trouble to correct the false reports. Other "authoritative" persons state that the American Air Service will turn all its vehicles over to the Belgians. The fact is that the Air Service has no authority to dispose of any automobile, the control being in the hands of the Motor Transport Corps.

France Has Little to Fear

France really has little to fear from an invasion of her own territory. If the old tariff goes into force again some of the cheapest makes of American cars can be sold on a price basis. In the medium car class local competition will be so keen that it is doubtful if American firms will be interested in the market.

The highest class of American automobiles never have threatened France. Trucks can be produced very much quicker than touring cars, so that there will be no

gap during which the American maker will have the market to himself. Further, the military subsidy scheme puts all foreign truck makers at a disadvantage. What France needs much more than protection for her own shores is protection for her export trade—a thing not easy to obtain.

French factories cannot possibly make deliveries in any quantities before the middle of 1919, and there is a fear that America, whose industry has been less disturbed than that of France, will have got a good hold of the foreign markets in the meantime.

As the automobile factories, in common with other engineering concerns, have been increased in size and have been modified in order to meet the needs of the nation, it is quite natural that the Government should be interested in getting them back to normal working conditions.

The Ministry of Armaments has been transformed into the Ministry of Industrial Reconstruction, with Mr. Laucheur at its head, and will have as its big task the organization of the resources of the country for peace. Measures are to be taken to facilitate the transformation of factories having worked for the Government, and among these measures will be important orders given to the automobile factories for agricultural tractors and machinery, internal combustion motors for the merchant-marine, and work for the postal and telegraph departments.

This Ministry will also be responsible for the allotment of raw material to the factories. For more than 2 years it has been impossible to secure an ounce of metal without a military order. Although the war is practically over, this restriction still remains, and the automobile industry is looking to the Government for action to release supplies of raw material. In very many cases the supply of raw material will be the determining factor in the production of trucks and cars for civilian use.

French Plants Greatly Expanded

The French automobile factories have two features in common: they have all increased enormously in size, and they have all completely modernized their plants. The number of workpeople at the present time engaged on purely automobile work is estimated at 800,000. During the war not a single one of the factories has been kept exclusively on automobile work; yet the change has made itself felt in varying degrees.

The biggest automobile producers during the war have been Renault, Berliet, Panhard-Levassor, Saurer, Delahaye, De Dion Bouton. But these firms have not by any means been exclusive producers of trucks and cars. Renault specialized on aviation engines right at the beginning, then extended to planes, and for the last year has been a big producer of tanks. Berliet has been a producer of aviation engines and tanks. De Dion Bouton has built Hispano-Suiza aviation engines, gun carriages, searchlights and motorized artillery.

There are automobile factories which for 3 years have not built a single automobile. Darracq is in this class, the whole factory having been turned over to aviation engines and planes, machine guns, etc. Delage transformed his modern plant into a shell producing factory right at the beginning; in 12 months he had covered the whole of the ground he considered would suffice for 10 years' normal development, and during the last 18 months he has been building series of passenger cars for staff use. Hispano-Suiza, whose aviation motor has been produced in bigger numbers than any other in the world, has been forced to abandon all thought of automobile production.

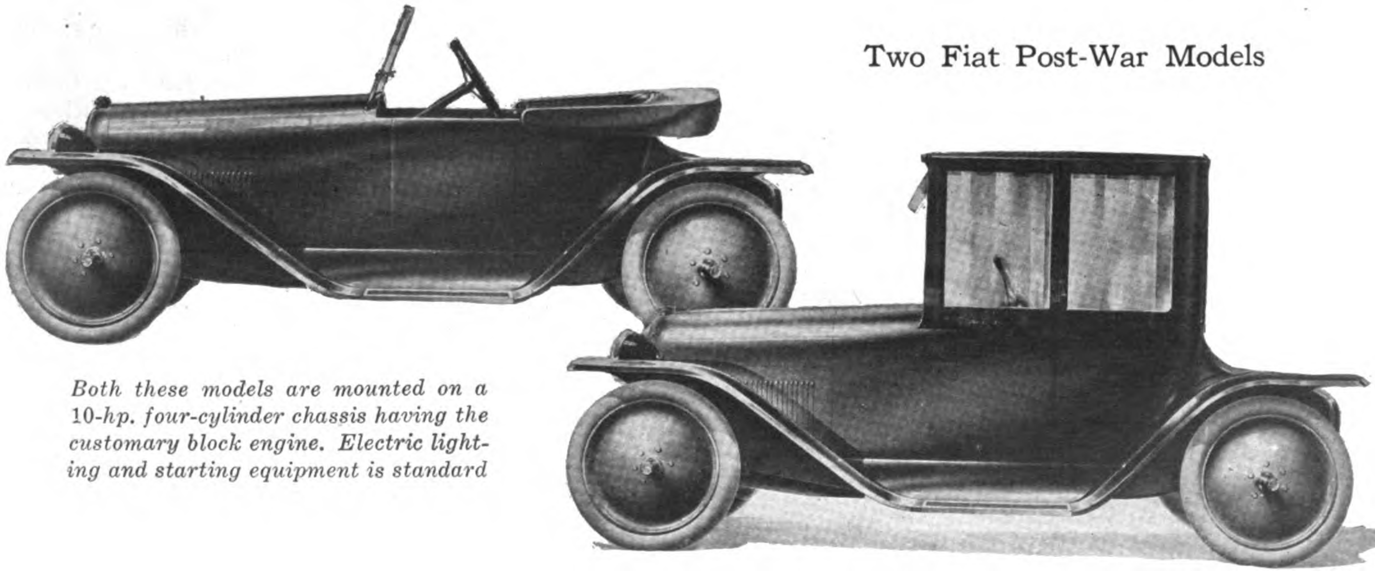
Firms which have received army orders for passenger cars are naturally in a better position than those having worked on other classes of goods. Some of these firms have been building what may be considered as peace models for over a year, and have had the opportunity of watching them in service with the army. Thus, while some will soon be ready to settle down to production, other firms are still confined to drawing office activities.

What the Future Holds

It is possible to give a general forecast of what future lines of development will be. Throughout France and Italy the tendency of the war has been to make the big firms more and more independent of outside supplies. The specialist idea has not taken hold. Some of the newcomers will produce cars with engines from A transmission from B and rear axle from C, but all the big, well-known firms have become entirely independent.

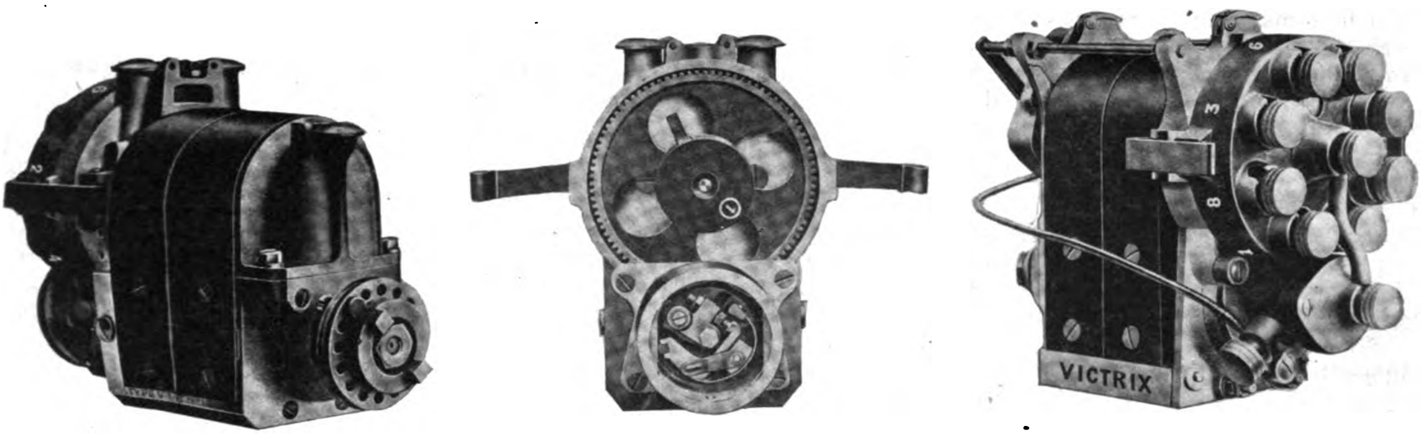
The most notable example is the Fiat Co., at Turin, Italy, which has grown to 40,000 workpeople, and now produces its own castings, forgings, ball bearings, magnetos and bodies—in fact everything but tires.

In France, Renault has followed on the same general lines, for although he does not build his own magnetos he controls the company supplying him with these organs. De Dion Bouton has been building magnetos in its own factory for 2 years and will continue to supply its own wants and meet those of some outsiders.



Two Fiat Post-War Models

Both these models are mounted on a 10-hp. four-cylinder chassis having the customary block engine. Electric lighting and starting equipment is standard



Victrix magneto which is being built in the De Dion Bouton plant for use on De Dion cars

As practically every European after-the-war car will be built with electric lighting and starting, designers no longer look upon the magneto as an absolute necessity and several have eliminated it in favor of battery ignition. Others admit that if they have not done so at once it is because they are afraid of public opinion. French motorists in particular have been educated to the belief that the only perfectly reliable ignition is by high tension magneto.

All firms have cut down on the number of types of cars, but very few have decided on a single model. Two will probably be the average. The big firms, too, are going to continue building touring cars and trucks, with, in many cases, agricultural tractors in addition. Four cylinders are going to remain in the majority, but there will be many more multi-cylinder engines than was the case in 1914.

Vertical Six Preferred

The preference appears to be for the vertical six, followed by the eight, with the twelve last. Thus, the Hispano-Suiza company, which has been all out on aviation eights for three and a half years, considers that six cylinders are sufficient for a high-grade touring car. Fiat, after building sixes and twelves for air work, limits itself to sixes for touring car work.

Detachable cylinder heads will be adopted much more extensively; thermo-syphon cooling will gain some ground for the smaller motors, but not for the big ones; unit construction of motor and gearbox is going to be a very strong feature; the tendency is to get away from chains for driving camshaft and auxiliaries; cylinder capacity of motors is being reduced; at the same time there is an important saving in the total weight of cars; high-grade alloy steels, which before the war were used only in aviation motors and a few racing and special cars, will be made use of for the normal production.

With unit construction of motor and gearbox both brakes are being put on the rear wheels, but in all cases they are internal expanding, not external. There will be several cases of brakes on the propeller shaft, behind the axle. Front wheel brakes are going to be used on many of the higher class cars. Gearsets will remain with four speeds and reverse. Springing is strongly towards cantilever, with a tendency in the direction of quarter elliptic for light cars. Wheels will be metal, to the exclusion of wood. The vacuum gasoline supply system is going to be adopted rather extensively.

Not many firms have announced their complete post-war program. The De Dion Bouton company, which was erroneously stated a few weeks ago to have passed into new hands, has just made it known that it will establish an erecting plant in England, this to be supplied with motors and transmissions from the French factory.

The program of this firm covers two eight-cylinder motors and two fours fitting into two chassis. Thus, one chassis will be furnished with an eight-cylinder V motor of 60 by 100 mm. (2.3 by 3.9 in.) or with a four-cylinder monobloc of 70 by 120 mm. (2.7 by 4.7). The second chassis will be equipped with an eight of 70 by 120 mm. (2.7 by 4.7) or a four of 85 by 130 mm. (3.3 by 5.1 ins.).

Fours and Eights for De Dion

In all four cases motor and gearset will form a unit construction mounted in the main frame by three point suspension. In all models the De Dion Bouton engineers have decided on a two bearing crankshaft. They will not be alone in this line of development, although 85 by 130 mm. is a bigger motor than has usually been considered suitable for a two bearing shaft.

De Dion Bouton has been building the Victrix magneto in his own shops for a considerable time and will use these on all passenger cars and trucks. Electric lighting and starting will be found on all passenger cars, a single unit being employed, and the whole installation built in the De Dion Bouton factory.

Fiat has announced much of its new program. The models will be four in number: an 8-hp. two seater (built with both open and closed body); a 12-hp. four-cylinder light touring car, with open body; a six-cylinder of less than 3 in. bore, and a high-class six of about 3½ in. bore. Some of the new features are electric lighting and starting for all models, detachable cylinder heads, unit construction of motor and gearbox, spiral bevel rear axle.

Delage is producing a high-class six, with unit construction, electric lighting and starting, and front wheel brakes. The Hispano-Suiza company, which was fully expected to come out with an aluminium eight, states that its leading model will be a high-grade six with valves in the head.

Small Four Will Be Popular

The most popular type of car is going to be a 10 hp., four cylinder with electric lighting and starting and a 2, 3 or 4 passenger body. The Citroen company announced that it will build a car of this type with a four-cylinder motor of 65 by 100 mm. bore and stroke (2.5 by 3.9 in.). It is commonly reported that the price will be around $1,000, but this is really mere speculation, for it is doubtful if even the Citroen company knows exactly at what price the car can be sold.

With the price of most steels five times higher than in 1914, it is going to be a difficult task for any firm to build a $1,000 car in France for the first year after the war. The Citreon company is one of the biggest

and best managed in France. Before the war the firm was chiefly interested in cutting gears, but Andre Citroen, the president of the company, was also president of the Mors Automobile Company and had other and close connections with the automobile industry. There is no doubt that Citroen will be a leading figure in the popular car class.

Peugeot is another firm having already got into this 10-hp. class, with a popular four cylinder model of 68 by 100 mm. bore and stroke. Some of these have been delivered during the war to the French army. Fiat is going to appear in about the same class.

Whereas before the war the most popular type of automobile in France had cylinder dimensions of about 80 by 130 mm. (168 cu. in. piston displacement) the post-war corresponding type will be reduced to about 90 cu. in. Some of the engineers claim that as there has been a corresponding reduction in weight and an increase in efficiency, these smaller motors will do all that was obtained from the larger ones in 1914.

Expect Big Tractor Development

Important developments can be expected in the production of agricultural tractors. Apart from the fact that the efficiency of French farms was low by reason of old-fashioned methods, horses have become so rare since the war that there is no alternative but to make use of gasoline tractors on the land. Many of the automobile factories are looking to agriculture to keep their works running, and the Government has pledged itself to encourage the development of the French agricultural tractor by all possible means.

One of the most important problems to be solved without delay is the supply of gasoline for civilian uses. The whole question has been put into the hands of the Government Committee known as the General Gasoline Committee, which has authority not only to improve methods of transportation, but to discover national supplies of fuel. No automobile owner can obtain fuel without an official permit, and these permits are only given parcimoniously to persons doing work of national importance. Travel restrictions have become easier since the signing of the armistice, but owing to the impossibility of getting gasoline it is not possible to use a car for anything but local service.

Since the General Gasoline Committee got to work there has been some improvement, although it is hardly visible to the private owner. In 1917 the imports of gasoline were 400,000 tons per annum. In 1918 they had been increased to 1,000,000 tons a year, and the reserve stocks had been increased sufficiently to allow private interests being considered. Not much improvement took place, however, owing to defective transportation methods in the interior of France.

Many Districts Without Gasoline

Certain important districts have been six months without receiving a single drop of gasoline for any civilian use. The number of tank cars has been increased; permission has been given to fill cans from the tanks in railroad stations; in certain districts army automobile trucks are to be used to deliver gasoline. The one gallon cans which are so extensively used in France are to be replaced in an important measure by 10 gal. cans, and the supply of cans has to be pooled. In the past refiners only received their own empty cans.

An early improvement in the gasoline situation is now being promised by the authorities. In October last Marshal Foch reserved 10,000,000 gal. of gasoline for the monthly use of the French army alone. The military requirements have decreased to such an extent that for the present month of December it is expected to be able to allot an extra 15,000 tons of gasoline for civilian use. It is quite probable that in a short time all gasoline restrictions will be removed.

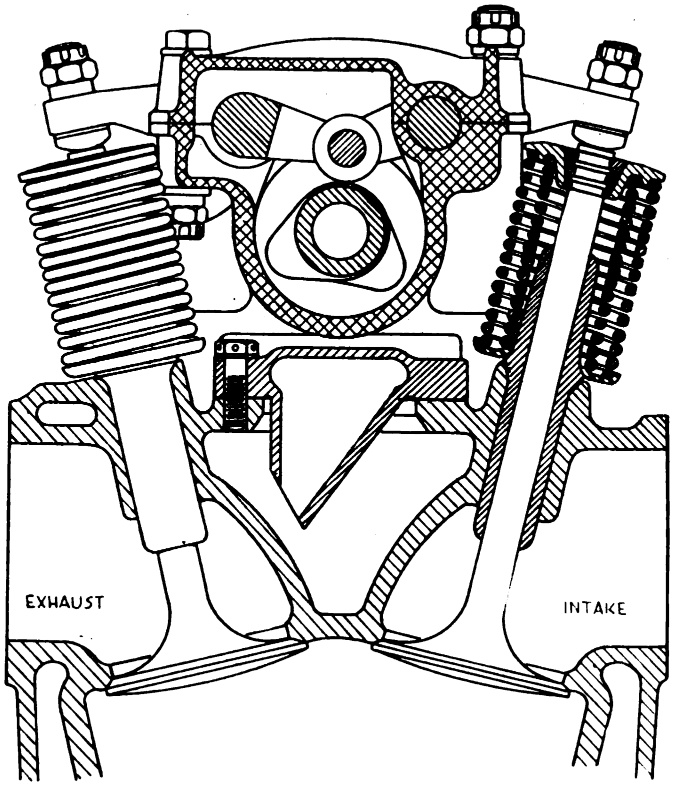
Mixed Fuels to Be Used

The present price of gasoline in the neighborhood of Paris is $1 per gallon, running to $1.25 in out of the way districts. For truck work in particular it is believed that the national fuel will be a mixture of 50 per cent of alcohol, 25 per cent benzol, and 25 per cent gasoline. An important group of truck owners, among which is the Paris General Omnibus Company, has announced its intention of absorbing as much of this fuel as can be produced in France during the next four or five years.

There is a decided tendency toward both racing and competition work. One of the best suggestions made is that a race or an important touring competition should be held in Alsace or in Lorraine during 1919. There is every reason to believe that this suggestion will be acted on, though it is not yet known what form the competition will take.

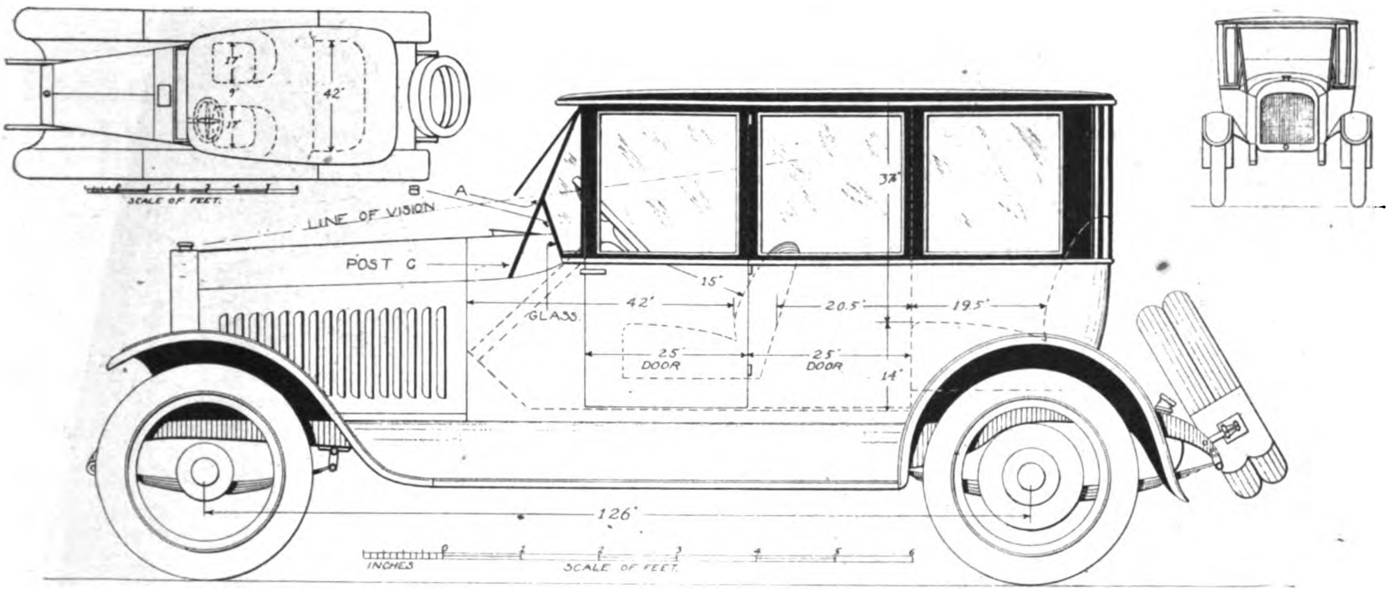
The only racing cars in Europe are a set of Sunbeams in England, two Fiats in Italy, and three Peugeots of only 2½ litres cylinder capacity. These latter were built for a race interrupted by reason of the war. Several firms have the advisability of racing under suggestion. One important organization has guaranteed to get a set of cars ready and a complete team together in 4½ months. These cars would be available for either America or France, according to which country takes up racing first. A month ago the idea of any race or road competition being held in 1919 was considered foolish; now it is very much to the fore.

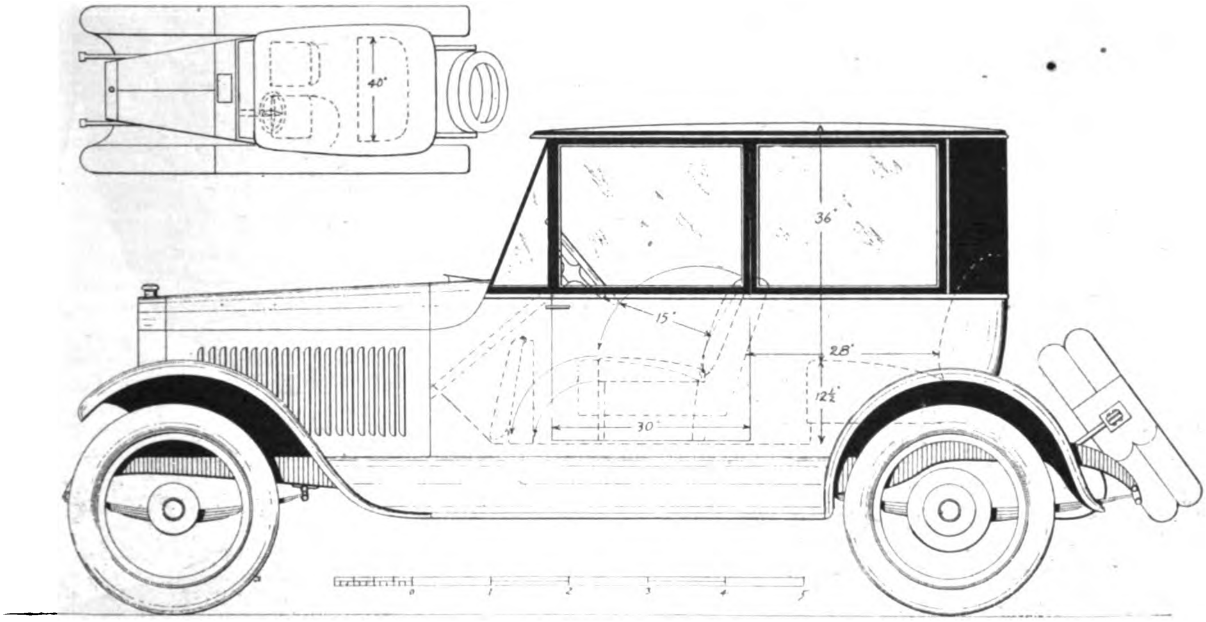
The automobile paper *l'Auto* has announced that it will hold a competition for marine motors at the end of May and a competition for farm tractors at the end of April. It is undoubtedly in this direction that there is the greatest need for improvement in France.



Large-scale view of Liberty valve mechanism

Front Entrance Inside Drive Body





THE tendency at this time to make all inside drive bodies as small as possible has brought into favor the front entrance type, with the collapsible seat on the right side.

The illustration shows how this works. The driving seat on the left side is comfortable and stationary, and the seat at the rear is a good width for two passengers, with ample room back of the front seat. In addition this seat is forward of the axle and for that reason will be very comfortable to ride in.

The folding seat, as indicated in the side view, is shown in the two positions, the position for use and when folded down. It is intended that when the door is opened for entrance this seat will always be folded, and when there are only three passengers the seat can be left in the folded position.

The stock seat sold for this purpose is not suitable; a special seat will have to be made, as it must be more comfortable and with larger seat cushion and higher back than the regulation auxiliary seat. This must be made to be used for continuous riding and should be just as satisfactory to ride on as the driving seat, with the exception that the cushion cannot be so thick on account of its being made to fold.

One of the advantages of this design is that the windows are very large, and all side windows, except the triangular one at the front, are made to drop flush, so that the side will be entirely open, except the slight obstruction made by the door pillars, which, as illustrated, are very small. All windows are designed to be operated by regulators.

The large side windows necessitate large doors, which are an advantage, as the doors open almost direct to the rear seat. It is customary for the passengers in the rear and the driver to be seated when the folding seat is set in position for the fourth passenger. It is possible, however, for the driver to get in from the left side without disturbing the passenger at his right.

The height of this body is less than the average, being

The Mark VIII Land Cruiser

Technical Description of Large Sized Battle "Tank" Developed During the Latter Period of the War—Equipped with an Adaptation of the Liberty Aircraft Engine; Weight Complete, 40 Tons

By J. Edward Schipper

THE cessation of hostilities upset the plans of the War Department for the production of 1500 of the largest tanks ever made. These tanks, known as Mark VIII, were to be a joint product of Great Britain and the United States, the hull, armament and parts of the equipment being furnished by Great Britain, while the powerplant and most of the propulsion units were to be supplied by the United States. Assembly was to have taken place in France.

The tank is 34 ft. 2½ in. long, carries a crew of eleven men and is propelled by a Liberty engine, modified to a certain extent to make it more suitable for this class of service. This large machine is bigger than the British Mark V tank, which proved so successful during General Byng's attack last year at Cambrai. The principal modification to the Liberty engine consists in the substitution of cast iron for steel cylinders. The Navy "20 per cent" piston is employed.

The Mark VIII tank is an armored track-laying type of fighting tank in which the hull or body acts as the structural frame as well as a housing for the propelling and fighting units and crews. It has no chassis or supporting frame structure, and rather resembles naval craft, as the hull carries within it the entire mechanism and all of the running gear except the track links, which pass around the hull in the form of a continuous belt on each side of the tank.

From the twelve-cylinder Liberty engine the power is transmitted through a planetary gearbox and through a chain drive, which latter turns the driving sprocket of the track. The length of the track belt allows the tank to accommodate itself to inequalities of the ground, while at the same time providing a rail surface for the supporting rollers.

The tank is 12 ft. in width and the overall height is 10 ft., 3 in. The engine and driving members, including the clutch, the planetary transmission and chain drive, are located in the rear of the hull. The engine, together with the clutch and planetary gearing and other necessary engine parts, occupies the engine room, which is 9 ft. 9 in. in length.

Fighting Room Ahead of Engine

From the rear of the engine room back to the center of the track-driving wheel is 4 ft. 8⅛ in. In front of the engine room is the fighting and operating room, at the forward end of which is the driver's seat with the control levers. On either side of the fighting compartment there is a sponson or projecting swinging structure carrying a 6-pounder gun. The sponsons contain gun mountings capable of giving a wide radius of fire with the 6-lb. guns. In addition, the sponsons themselves may be swung back into the interior of the fighting compartment to reduce the width of the machine to permit it to be located on a standard railway car.

Mounted above the fighting compartment is the main turret, which carries five machine guns. Above the main turret is the directing officer's conning tower, from which it is possible to obtain vision on all sides of the machine and from which its movements may be directed. Within the fighting compartment are sufficient ammunition storage provisions for both 6-pounder and machine guns. The fighting compartment is entered through a door on either side and machine guns are also mounted in the doors. This gives a total of seven machine guns, five in the main turret and two in the doors; and two 6-pounders, one located in each sponson.

The fighting compartment is separated from the engine room by a bulkhead fitted with sliding doors.

The sides of the hull are extended to provide a guide for the track. The rear extension contains the housing for the chain drive and the track-driving sprocket, and the forward extension carries the track adjusting wheel, which can be moved forward or backward to tighten or loosen the track chain.

Steering Effected by Track

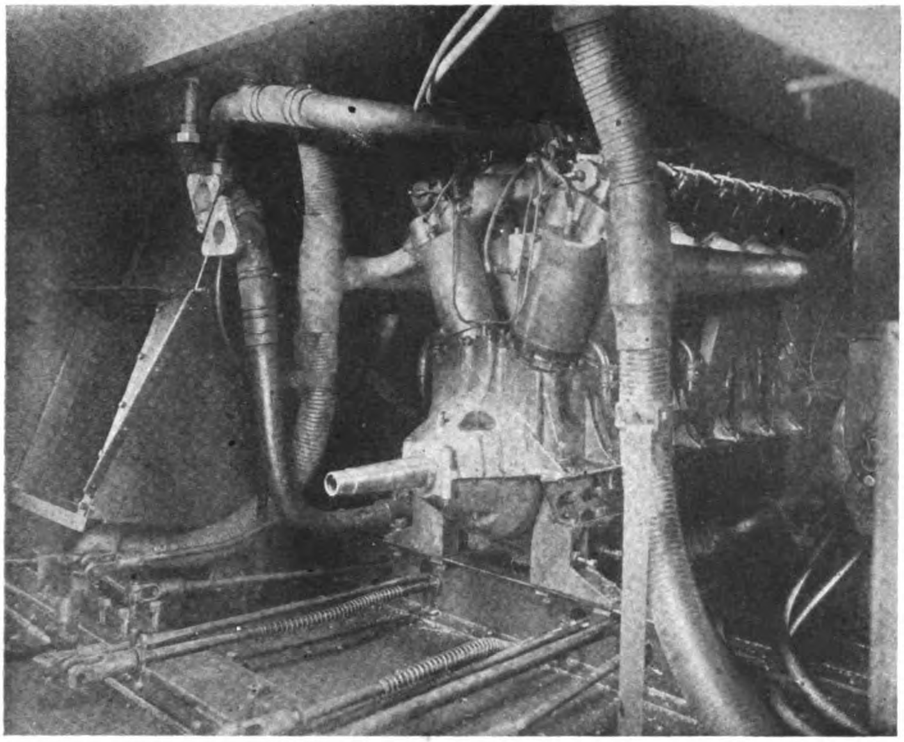
Steering is effected by allowing the track on one side to move at a faster rate than the track on the other, which tends to swing the machine in the direction of the slow-moving track. If one track is locked and the other track is allowed to move ahead, the machine will be turned in the shortest possible radius. The radius in which the machine can be turned depends to a large extent upon the nature of the ground, as, owing to its weight, it will dig up the ground to the side as it is being turned, which will impede the rate at which it can be swung around and will sometimes necessitate a wider turning arc.

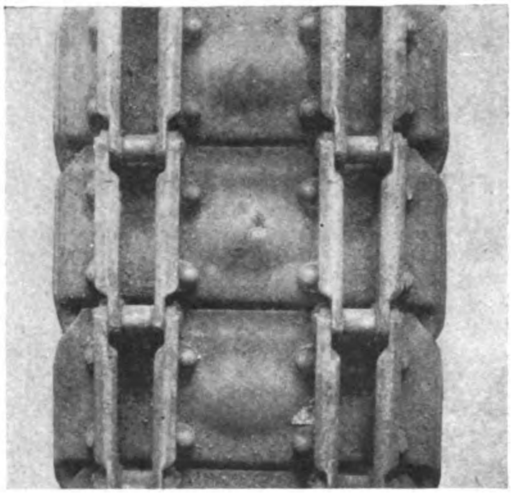
Control of the engine, clutch, planetary gear reduction, steering, etc., are all taken care of from the driver's seat, which is located in the forward end of the hull. It is of such a height that the driver's head is within a box-like structure at the front end of the main turret. Slits are cut in this compartment which allow the driver to look either side or ahead. The slits can be closed by rotating protecting shields when under fire, and when not under fire the driver can raise a hinged door at the front of the turret, affording an unobstructed view ahead of the machine.

In addition to the spark and throttle levers and other engine controls, the driver has four levers and a pedal. The two inside levers control the planetary transmission. The left outside lever controls the clutch and the right outside lever is for reversing the pedal, which is in the center of the track brake. When either transmission control lever is in neutral the track brake on that side can be applied, so that shifting both levers to neutral permits applying track brakes to both tracks.

The gasoline supply is carried in three tanks, of 80 gal. capacity each, mounted near the rear of the machine, just below the top plating. These tanks are all similar, and are mounted side by side. The gasoline is forced by pressure from these three tanks to a gravity tank mounted directly above the engine, from which it flows by gravity and pressure to the two carbureters. Pressure is supplied by the engine-driven air pump, a four-cylinder design, operated by the camshaft. The gasoline tanks are placed to the rear of the engine room and separated from it by the bulkhead.

The air pump is mounted just above the clutch, and is driven by a belt from the pulley on the engine shaft brake. The pulley on the air pump operates a camshaft, which works directly against the pistons or plungers of the pump. With the engine at rest sufficient pressure can be secured to start the flow of fuel by means of a hand pump, which is located





Above—A view of the engine room, with the Liberty motor in position. Right, top—Method of guiding in track. Right, bottom—Inside of track, showing rollers, links and rail surfaces

on the bulkhead between the engine room and fighting compartment. Each of the three tanks communicates with the gravity tank above the engine through a pipe containing a cock, and each tank can be turned on or off at will.

The hull of the tank is composed of armor plate of various thicknesses, ranging from ¼ in. to a little more than ½ in. This armor plate, which is 0.6 in. thick in practically all exposed parts of the hull, is capable of withstanding direct hits from machine guns or rifles and will turn heavier ammunition if struck at an angle. It takes a direct hit from a fairly large piece of artillery to put one of these tanks out of commission. For this reason it is invulnerable to the fire of infantrymen or machine gunners.

Complete Machine Weighs 40 Tons

Inasmuch as the complete machine weighs approximately 40 tons, the clutch has been designed to gradually overcome the inertia of the heavy mass, providing first a slipping and then a positive engagement. The slipping engagement is secured by means of an asbestos-faced cone clutch which comes into play first as the asbestos facing and the cone-shaped surface of the flywheel come in contact. Later positive engagement of the clutch is secured by splines or teeth on the clutch sleeve, which mesh with corresponding splines or teeth on the end of the crankshaft.

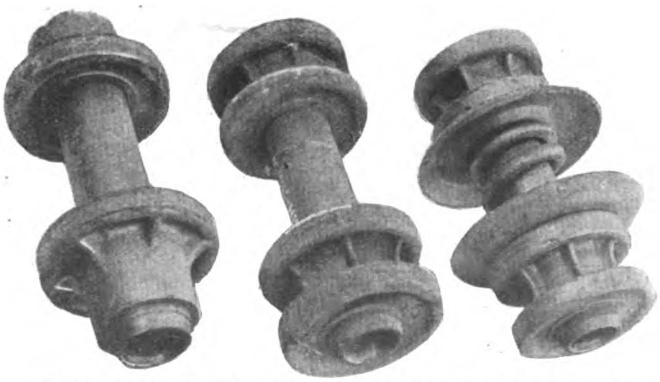
The function of the frictional part of the compound clutch is to pick up the load, setting the transmission drums in rotation. After the frictional part of the clutch has accomplished this the positive clutch is engaged. The driving clutch unit is bolted to the flywheel of the engine and is a conical frustrum of carbon steel. Pressure is applied to the cone by a large clutch spring concentric upon the clutch shaft. This spring is 5⅝ in. in diameter and has a coil length of 4¼ in. The clutch sliding collar or sleeve and the cardan shaft are joined by a nickel steel coupling.

The planetary gearset has two forward and two reverse speeds. It is mounted transversely on the machine in the rear end of the engine compartment. It provides the necessary gear reduction between the engine drive and the track propulsion units, and also carries the drive outward on both sides from the center line of the machine to the outside track mechanism.

The planetary gearset is not direct-connected to the engine but is driven from it through a pair of bevel gears. For reversing, the gears are shifted in relation to one another by means of a shifter fork mechanism, and the high and low speeds are secured by means of brakes, which act on drums forming part of the planetary gearbox. The reductions in the box are 5 to 1 on low and 1.285 to 1 on high. The reduction by the bevel gearset is 14:46. The reduction between the chain sprocket and the roller pinion is 12:23, and that between the roller pinion and the track driving wheel 9:37. This gives a total reduction between the engine and track of 32,545:1 on high speed, and 126.64:1 on low speed.

The use of the planetary type of gearbox on a machine of this weight does away with the necessity for shifting gears except for changing from forward to reverse. It is highly necessary, therefore, to strictly observe the precaution of allowing all moving parts to come to rest before shifting from forward to reverse,

The bevel gear drive from the engine to the planetary gearset comprises two bevel wheels. Facing toward the front of the machine, the left bevel wheel provides the reverse motion and the right bevel wheel gives the forward motion. The proper bevel wheel for either direction of motion is engaged by means of a dog clutch, which slides on the splines of the cross shaft. Both bevel wheels are in constant mesh with the bevel pinion, but only one is fast upon the shaft at a time;

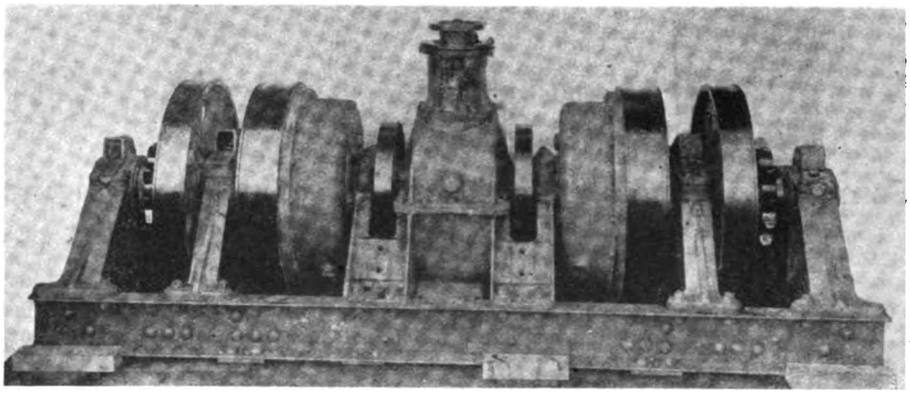


Left—Upper road track roller. Center—Lower road track roller without springs. Right—Lower road track roller with springs

the other acts simply as an idler, and has no part in the driving.

From the bevel wheel engaged by the dog clutch the drive passes to the cross shaft and thence to the sun pinion at the opposite end of the cross shaft from the bevel wheels. The sun pinion meshes with the large planet pinion, and this in turn meshes with the ring gear secured to the gear casing. This casing carries with it the low speed brake, the same bolt passing through the ring and the two halves of the casing.

When not restrained by the application of the brake the casing carries the drive back to the chain drive sprocket. The gear casing also carries a pin, upon which is mounted a small planet pinion, which meshes with a small gear ring carried on a disk, which in turn is splined to the cross shaft. Revolving with the disk which carries the spindle for the small pinion is the high speed brake.

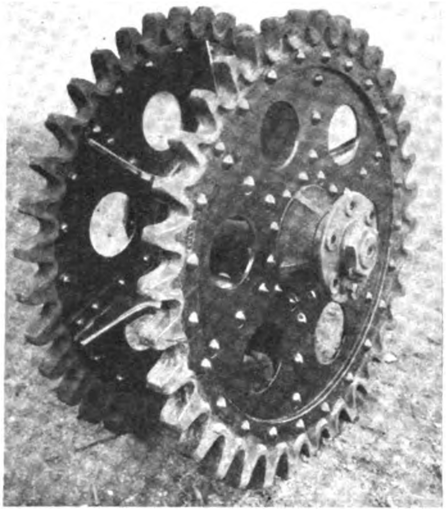


Exterior of the double compound epicyclic transmission on Mark VIII tank

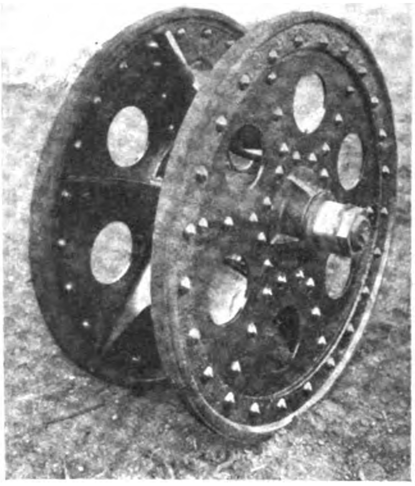
Driving Sprocket

From the planetary gear the power is transmitted to the track by means of a driving chain. The driving sprocket is mounted on the planetary cross shaft and connects through the chain with the sprocket wheel at its center and which is located midway between the two roller pinions. These roller pinions mesh in turn with the road track driving wheel, which engages directly with the track.

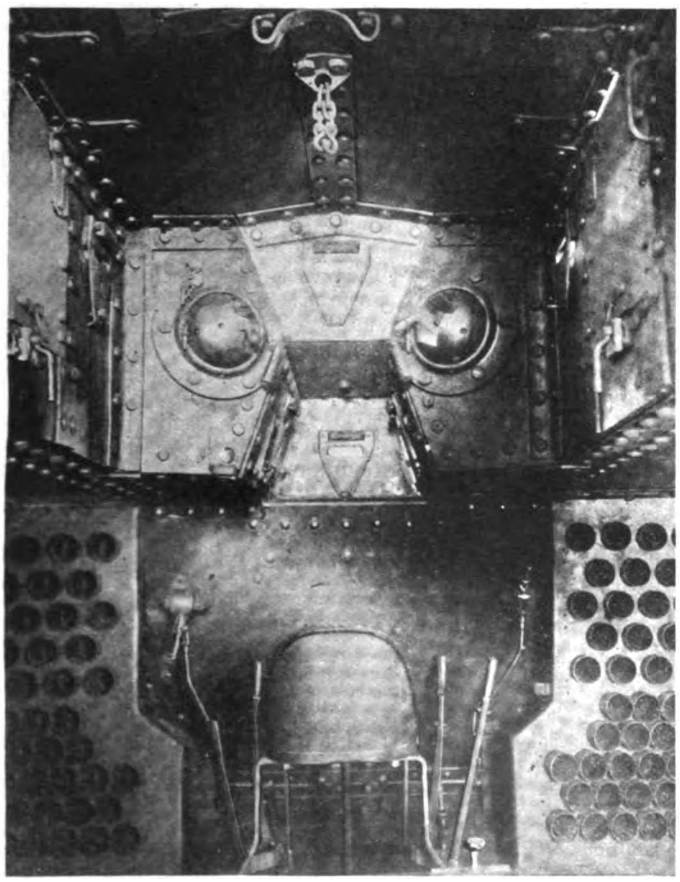
The road track, in the form of a continuous belt, runs around the entire hull. There are fifty-eight rollers which carry the weight of the machine. In addition to these lower rollers there are two upper rollers serving as guide for the track. Of the fifty-eight rollers, twenty-eight are fitted with spring plates which act as spacers. Since the road track is double, these spacers keep the rollers the proper distance apart. The two top road track rollers are alike. One is located on each side at the point where the track makes its sharpest angle and where, consequently, the greatest strains may be expected. Elsewhere along the top the track slides on the top track rails.



Road track driving wheels



Road track adjusting wheels



Driver's seat and driving compartment of Mark VIII tank

Track Links

The track links are of drop-forged steel, having a length, from pin center to pin center, of 11.154 in. These links must be very accurately assembled, the allowable limit between pin centers being 0.004 in.; *i. e.*, when links are assembled in pairs they must agree to within .004 in. between pin centers. The links perform the double duty of binding the chain together, and also of forming a rail surface upon which the machine rolls. It takes a left and right link bar to make up one link assembly. These bars are connected by the pins, which are driven through. The pins are surrounded by carbon steel bushings, which take the wear due to meshing with the road track driving wheel. Riveted to the links are the track shoes, which are in contact with the ground. These are pressed from armor plate, and so shaped that they link one over the other. The track shoe is 26½ in. in width. Under normal conditions there is a total of 41.052 sq. ft. of track surface in contact with the ground.

The machine is operated entirely from the driver's seat, located at the forward end of the hull proper. The driver's seat and the forward control unit, including the necessary levers, shafts and linkage, are made up as a single assembly.

The change speed levers for the left and right tracks are similar. The lever is adapted to engage in two quadrant jaws, the outside taking care of the high speed and the inside of the low speed. When the lever is engaged with either jaw and pulled back, the corresponding speed is engaged.

High-Compression Oil Engines

Some New Injection Methods for Heavy-Fuel Engines Described in Paper Read Before S. A. E. Mid-West Section

A COUPLE of new types of fuel injection heavy oil engines were described and compared with the older engines of this type, the Diesel and Hvid, by W. G. Gernandt at the monthly meeting of the Mid-West Section of the Society of Automotive Engineers. Mr. Gernandt summarizes the advantages and disadvantages of the Diesel method of fuel injection as follows:

ADVANTAGES

1—The fuel injection is mechanically timed.
2—The fuel is thoroughly atomized prior to injection.
3—Widely different fuels may be used without alteration.
4—The rate of burning can be controlled mechanically.
5—The two-stroke principle can be used successfully.

DISADVANTAGES

1—Refrigeration during injection.
2—Reduced flexibility.
3—The use of a high pressure fuel pump.
4—The use of an air compressor, coolers and tanks.
5—Troublesome to start.

Similarly he summarizes the advantages and disadvantages of the Hvid method as follows:

ADVANTAGES

1—No working parts for the injection of the fuel.
2—The fuel is thoroughly atomized prior to injection.
3—The fuel is heated prior to injection.
4—Flexibility much greater than Diesel.
5—Easily started.
6—Fuel economy greater than Diesel because of heating of fuel.

DISADVANTAGES

1—The fuel injection is not mechanically timed.
2—Inability to use the two-stroke principle of operation.
3—Necessity of changing fuel cup for widely different fuels.

The two new systems of fuel injection described are the McClintock and the Gernandt.

McClintock Method of Injection

In the McClintock engine the fuel is injected into the combustion chamber by means of compressed air trapped in a separate chamber during compression. The operation of this engine is as follows: When the pressure in the cylinder is the least, or during inspiration, fuel, which is under a slight pressure maintained on the fuel tank by a small air pump, is deposited in a small chamber in direct communication with the combustion chamber through small injection tubes. During the compression stroke the air is compressed into a separate chamber through an automatic valve. As the clearance between the head and the piston is only that necessary for mechanical clearance, practically all of the air in the cylinder is compressed into this chamber.

When the piston starts on its power stroke, the air from the chamber is by-passed into the combustion chamber through a mechanically timed valve and a venturi-shaped port into which project the fuel tubes. Because of the shape of the air port the fuel is drawn from a small chamber and an intimate mixture of air and fuel takes place, with a result that the combustion takes place immediately, and with a close resemblance to the Bunsen burner. The amount of fuel as well as the duration of combustion is controlled mechanically by the load on the engine. With this method of burning, extremely high temperatures result and the materials for the injector and venturi tubes must be carefully selected.

From a standpoint of combustion, this engine possesses the advantage of an intimate mixture between the fuel and the air necessary for combustion. However, as the piston must move on its down stroke a considerable distance before the transfer of air takes place, combustion comes late in the stroke, with a resultant high exhaust pressure and temperature. The engine is, by the way, just as flexible as the majority of automobile engines.

Summarizing the advantages and disadvantages of the McClintock engine, they are as follows:

ADVANTAGES

1—The fuel is thoroughly atomized and mixed with the air.
2—The fuel is heated prior to injection.
3—Flexibility extremely good.
4—The rate of burning can be mechanically controlled.
5—The two-stroke principle can be used successfully.
6—Fuel economy higher than Diesel.
7—Widely different fuels may be used without alteration.

DISADVANTAGES

1—Quite complicated valve mechanism.
2—The fuel injection is not mechanically timed.
3—Somewhat troublesome to start—similar to Diesel.
4—Advantage of high-compression partially lost prior to combustion.

Gernandt Method of Injection

In this engine the fuel is injected into the combustion chamber by super-compressing a portion of the products of combustion which have been trapped at a time when the pressure in the cylinder has attained its maximum. Mechanically, this may be accomplished in various ways, depending upon the general design of the engine, and the trapping chamber may be actually sealed by the use of valves between the super-compressing means and the combustion chamber, or it may be in direct communication with the combustion chamber through the very small injection holes. The injection method is identical in both cases and takes place as follows:

During the suction stroke in a four-cycle, or during simultaneous exhaust and inspiration in a two-cycle engine, fuel is deposited in a small chamber between the combustion chamber and the super-compressing means, either by gravity or under a slight pressure maintained on the fuel in the tank. The fuel is metered and passes through a mechanically timed valve. During the compression stroke the fuel attains temperature and the pressure rises in the fuel chamber. When the piston reaches its upper dead center, the products of combustion, previously trapped, are super-compressed mechanically and forced through the fuel chamber and into the combustion chamber.

Thorough atomization takes place during the injection period. as in the Diesel engine, but in this case the injection gas is highly heated and refrigeration has been practically eliminated, the amount of the products of combustion necessary for injection being so small that the burning effect has not been impaired. Also there is no burning of the fuel until it is actually injected into the combustion chamber. In this engine the fuel, the injection and the rate of injection are mechanically timed, and with an increase in the crankshaft speed there will be a corresponding increase in the rate of fuel injection because the fuel must enter the combustion chamber during a certain angular travel of the crankshaft and not during a certain fixed time. Thus the flexibility of this motor will be very good.

Summarizing the advantages and disadvantages in this method of injection, they are as follows:

ADVANTAGES

1—The fuel injection is mechanically timed.
2—The fuel is heated prior to injection.
3—The fuel is thoroughly atomized prior to and during injection.
4—The rate of burning is mechanically controlled.
5—Widely different fuels may be burned without alteration.
6—The fuel economy is greater than Diesel because of preheating.
7—Greater flexibility.
8—The two-cycle principle can be used.
9—The engine is very easily started.

DISADVANTAGES

1—Addition of super-compressing means, making engine more complicated than the Hvid but much less than the Diesel.

Automobile Performance Analyzed by Mechanical Differentiation

Acceleration, an Important Factor in Automobile Operation, Is Best Determined from Time and Distance Observations by Means of a Mechanical Differentiometer

By Armin Elmendorf, M. Sc.*

IN automobile tests the motor is the usual object of investigation. While considerable valuable data about automobile performance are obtained in motor tests, such tests are cumbersome and yield only a part of the information desired. The purpose of this article is to show how much more complete information may be secured from a single curve which is obtained with less preparation than that required for an engine brake test. The curve referred to is the velocity-time curve of an automobile which is first accelerated under the best running conditions from its minimum speed to nearly its maximum speed and then allowed to coast by cutting off the ignition. With no other data than this curve and the weight of the machine with its occupants, it is possible to obtain the following information about automobile performance:

(a) The grade the car can "make" at various speeds.
(b) Total power losses, which include that due to wind resistance, friction in the machine and losses at the tread of the tires.
(c) The horsepower required to drive the car at any constant speed.
(d) The excess power available at any speed beyond that needed to keep the car going at that speed.
(e) The indicated or cylinder power of the engine at any speed.
(f) The efficiency of the automobile as a machine at any speed.

Theory and Definition of Terms

Average and Instantaneous Acceleration—Fig. 1 shows an actual experimental velocity-time curve for a 6-cylinder car running in low gear. It is desired to know what its acceleration is at the end of three seconds. By the usual definition of the term, acceleration is the time-rate of change of velocity. If then we subtract the velocity of the automobile at the end of three seconds from its velocity at the end of five seconds we have the change of velocity that took place during two seconds and may obtain the average acceleration during this period by dividing the difference in velocity by 2. The difference in velocity is given in the diagram by the distance B′C′. This distance divided by AC′ is the average acceleration for the period under consideration. It will be observed that the average acceleration is given by the slope of chord connecting two points on the curve. Similarly, the average acceleration for the second following the third is given by the slope of AB″, and for the one-half second following the third second by the slope of AB‴. Decreasing the time interval in this way shortens the chord and gradually changes its direction until the limiting case is reached where the time interval is indefinitely small and the chord has the direction of the tangent and the average acceleration becomes the *instantaneous* acceleration. Thus the instantaneous acceleration of the car under consideration at the end of the third second is given by the slope of the tangent AC drawn at A. If the magnitude of this slope is plotted for each point as an ordinate from a convenient axis we obtain the instantaneous acceleration curve, usually called simply the acceleration curve. This curve is shown by M N O in Fig. 1.

In the terminology of calculus, the acceleration curve is the first derivative curve of the velocity curve, and acceleration is the derivative dv/dt where v is velocity and t is time.

Traction Effort—By carrying out the division mentioned, it will be seen that the acceleration of the car when t = 3 sec. is 4.4 ft. per sec.^{2} The question arises, how much force would a second car pulling this one have to apply to impart to it this acceleration, assuming that the car pulled is absolutely frictionless? Applying this elementary relation between force, mass, and acceleration, we obtain for this car, which weighed 3225 pounds with its occupants,

$$F = \frac{3225}{32.2} \times 4.4 = 440 \text{ pounds.}$$

A force of 440 pounds applied to an actual car would, however, not impart this acceleration, because friction must also be overcome. If we denote the pull which is

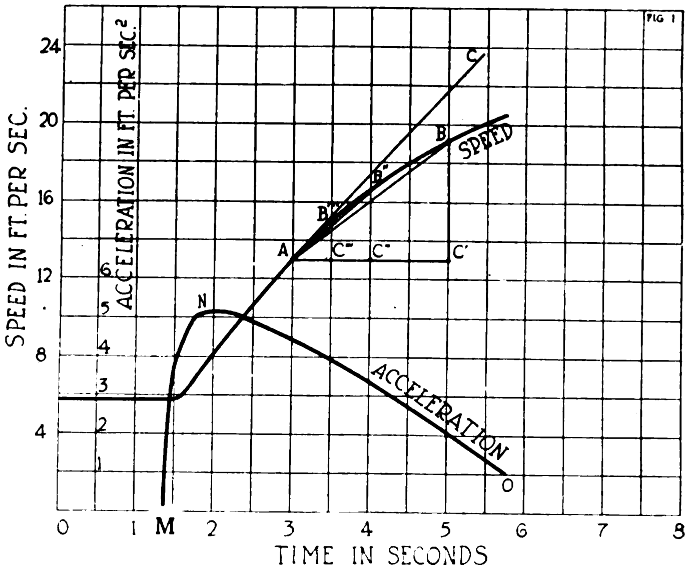


Fig. 1—Speed-time and acceleration-time curves of 6-cylinder car

*Madison, Wis.

just large enough to keep the car going at constant speed by R, we see that the total force required to impart the desired motion to the car is the sum of F and R. This force we will denote by the term, traction effort. It is obvious that when the car is proceeding at a constant speed the traction effort to pull it is equal to its total resistance.

Traction Power and Indicated or Cylinder Power—The power expended by one car in pulling a second we will call "traction power." Let us forget for the moment the usual power formulas and go back to the more fundamental definition of power as the rate of doing work. Assuming that a force of 100 lb. will keep the car going at a constant speed of 13 ft. per second, we have a total force of 540 lb. acting on the car, which is moving at the instantaneous speed of 13 ft. per second and being accelerated at that instant at the rate of 4.4 ft. per sec.², we see that work is being done at the rate of

$$540 \times 13 = 7020 \text{ foot-pounds per second.}$$

Dividing by 550, the horsepower constant, we obtain as the horsepower expended in imparting an acceleration of 4.4 ft. per second² to the car and overcoming its total friction, the value of $7020/550 = 12.8$ hp.

We will suppose that the clutch had been left in so that the pistons were in motion while the car was being pulled along, introducing the friction of all moving parts. This, added to the wind resistance, is the total friction which necessitated the pull of 100 lb. in the present problem. Now, if the rope pulling the car were suddenly cut and the spark thrown in so that the car propelled itself and imparted to itself, through the force at the rims of the wheels, the same acceleration, it is seen that the cylinders must do just as much work per second as the first car did in pulling this one. In other words, the cylinder or indicated power of the second car is equal to the traction power of the first.

This equality between traction power and indicated power is in reality only approximate. Two slight errors are introduced, one of which cannot be corrected and is probably quite insignificant, and the other may be corrected but not without considerable labor. The first error arises from assuming the friction losses in the mechanism when the engine is running under compression equal to the friction losses when the charge is exploded.

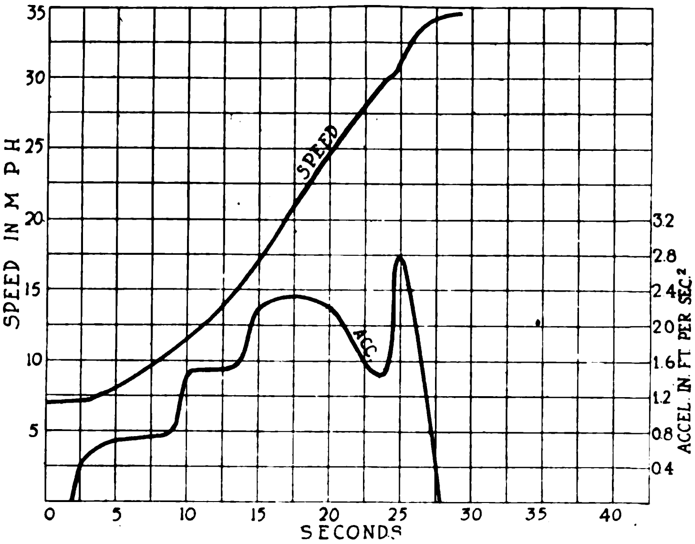

Fig. 4—Performance curves of 4-cylinder car in high gear

The second error arises in neglecting the power required to give all rotating parts an angular acceleration. Using the following notation we may correct for this after determining the angular acceleration of the major rotating parts corresponding to each value of the linear acceleration of the car as a whole, and the moment of inertia of the rotating part about its axis of rotation. Let

I = the moment of inertia about the axis of rotation.

α = the angular acceleration.

ω = the angular velocity corresponding to α.

Then at any instant the total torque required to impart angular acceleration to all the rotating parts is given by $\Sigma I\alpha$, where both I and α may be different for each part and the horsepower consumed in imparting angular acceleration is $\Sigma I\alpha\omega/550$, where I is in slung-ft.², α is in radians per sec.², and ω is in radians per second.

The main rotating masses are, of course, the wheels and the engine flywheel, for which the moments of inertia may be readily obtained experimentally.

Automobile Efficiency.—It is desirable that power losses due to friction and wind resistance be as low as possible. The lower the friction losses, the greater the ratio of the power available to accelerate the car to the total or indicated power. The latter ratio expressed in percentage we will denote by *automobile efficiency.*

Hill Climbing Ability—In order to keep a car going up a grade at a constand speed it is necessary

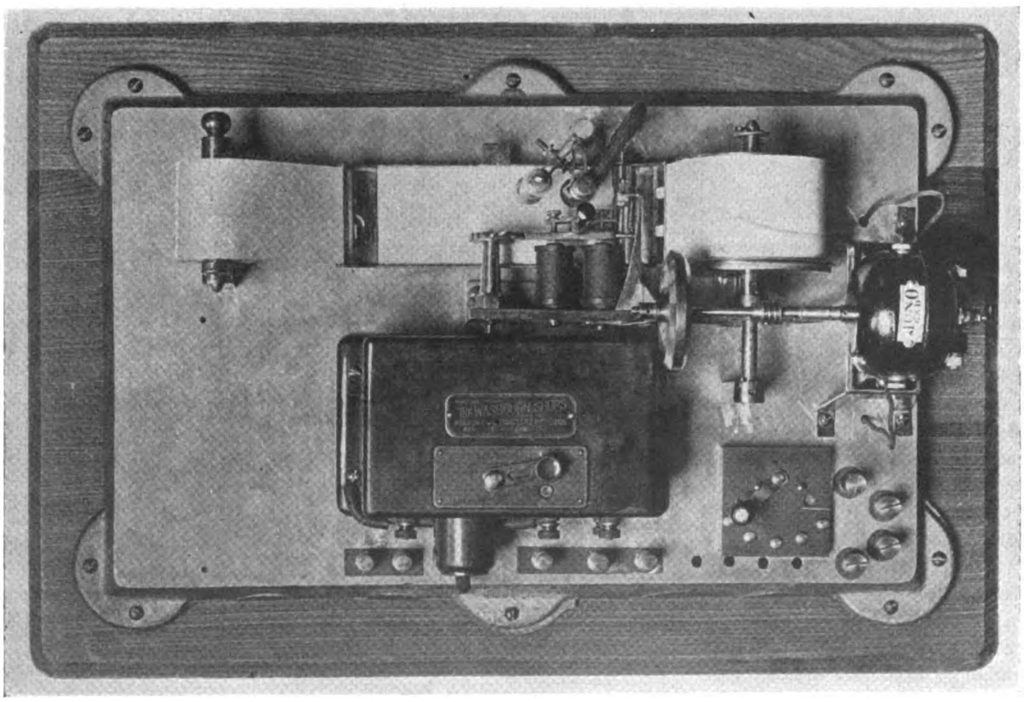

Fig. 2—Instrument for obtaining a graphical record of automobile speed

that the force driving it forward be equal to the component of its weight acting down the incline. Or, if the acceleration of gravity be resolved into two components, one acting down the incline, and the other normal to the incline, it is obvious that the engine must be able to impart an acceleration to the car on a level equal to the former component in order that the car may proceed up the given grade at a constant speed. Thus, in order to climb a 20 per cent grade the car must be able to attain an acceleration of 6.4 feet per sec.[2*]

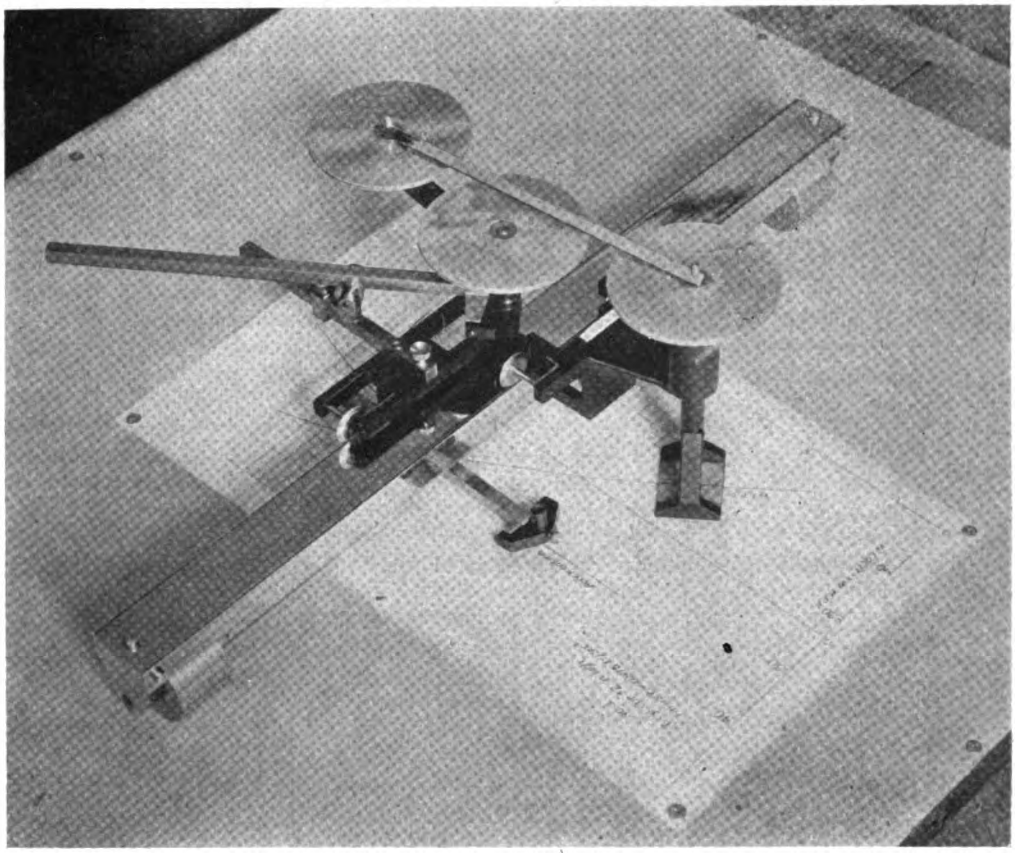

Fig. 3—The author's differentiating machine

The velocity data from which all speed-time curves were plotted were obtained by Messrs. Barker and Safford and presented to the faculty of Worcester Polytechnic Institute in a thesis for an engineering degree in June, 1917. The tests were made on the straight-away of the Narragansett Speedway. In starting to accelerate the car under test the driver used his discretion about the best throttle position. Acceleration runs were made usually by starting very near the minimum car speed and proceeding to nearly the maximum speed for the gear ratio used.

Tests were made on two six-cylinder cars, an eight-cylinder, a twelve-cylinder, and a four-cylinder car, each of which was given one or more trials when running in low gear, high gear, and intermediate gear. A coasting run was made on the eight-cylinder car and a brake test was made on the four-cylinder car, which was equipped with a vacuum brake.

The apparatus used for getting the speed-time record is described in the June, 1917, Report of the Research Division of the Standards Committee of the S. A. E., which report may be referred to for more details. In its essentials it consists of a mechanism for winding a broad paper ribbon which receives perforations from electric sparks sent across a gap each time contact is made by a make-and-break device attached to the wheel steering arm of one of the front wheels. A magnet actuated by current from a timing device indicates periods of one second upon the ribbon by notching the line made by a

*Here again, as was observed in the previous footnote, an error is made, so that the method is only approximately true.

The power which is consumed in imparting angular acceleration to the rotating parts when the car is running on a level becomes available to climb the grade if the car goes uphill at a constant speed, so that the grade established by computations from the observed linear acceleration of the car on a level is slightly low.

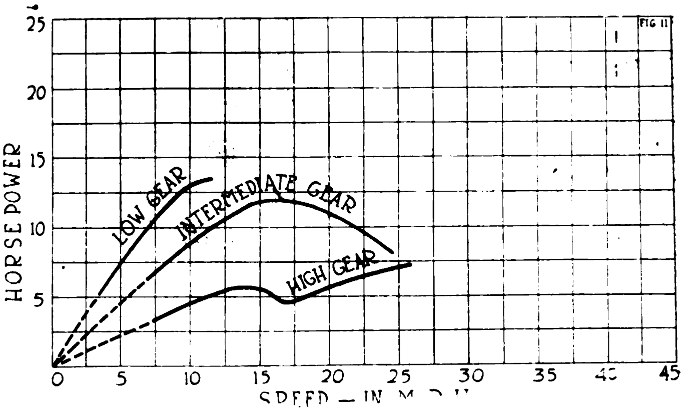

Fig. 11—Traction hp. of 6-cylinder car No. 1, rated at 31.5 hp.

pen. The number of sparks between second gaps represents the distance the car has traveled in a second, that is, the average speed for the second. The difference in the number of sparks represents the difference in average speeds between seconds, hence the average acceleration for a second. It is only necessary to determine by measurement the distance the car travels for each spark and the record may be calibrated to read in feet.

By plotting the speed-time data a curve is obtained that lends itself well to mechanical differentiation. A top view of the instrument is shown in Fig. 2.

Differentiation of the speed-time curve gives the acceleration-time curve as previously explained, in which every ordinate represents the instantaneous acceleration at a given instant. The author's differentiating machine with which the acceleration-time curves were developed is shown in Fig. 3. It is simply a device for giving a graphical record of the rate dv/dt, or slope at any point of the speed-time curve. Two hair lines crossing each other at right angles are ruled upon a transparent plate and serve to get the direction of the tangent at any point on the given curve. The slope of the curve at this point is plotted as an ordinate by the pen shown in Fig. 3 as resting upon the acceleration curve. A number of points are obtained in this way, and a smooth line is drawn through them by hand giving the desired acceleration-time curve. Except for steep slopes it can be depended upon to give results accurate to 1 per cent.*

(a) *Detecting Irregularities in Engine Performance*—Assuming that the driver operated the car to best advantage in this run, as far as he could judge, such curves as those shown in Fig. 4 would indicate poor performance, inasmuch as maximum acceleration is not reached until several seconds have elapsed after starting, and the acceleration is very non-uniform in that it fluctuates considerably in magnitude.

(b) *Traction, Friction, and Indicated Horsepower*—In Fig. 5 the curve of traction horsepower was obtained, as previously explained, by multiplying the mass of the car by the acceleration and velocity at any instant. The friction horsepower was obtained similarly by multiplying the mass by the deceleration at any instant and the velocity at that instant. The power obtained in this way was plotted against the speed. The sum of the total friction power and the traction power, as previously shown, gives the total power of the engine; that is, the indicated power. It is interesting to note how nearly straight the indicated horsepower curve is, showing that the indicated power of the engine, for this car at least, is practically proportional to the speed; and, further, that at the maximum speed attained the indicated power is almost double the rated engine power. The rapid increase with speed of the friction horsepower after a speed of 30 m.p.h. has been attained is also of interest in that it tends to show that the power lost due to air resistance increases more rapidly than does the speed

*For a description of the general subject of mechanical differentiation and a description of an earlier model of the instrument, the author's papers in the Journal of the Franklin Institute for January and February, 1918, may be referred to.

beyond 30 m.p.h. The power available for traction remains practically constant between 20 m.p.h. and 40 m.p.h., reaching its maximum at about 30 m.p.h.

One of the most valuable of curves to show automobile performance is the curve showing the power required to drive a car without acceleration, that is at any constant speed. The friction-power curve is exactly such a curve, for it shows how much power the engine must deliver at any speed to overcome all friction; that is, to propel the car at a constant speed. Variations in body design may, for example, affect the friction power considerably at high speeds. Differences in power losses in the tires may possibly be detected by varying the air pressure or by changing the tires.

(c) *Automobile Efficiency*—The proportion of the total power in the cylinder available for traction falls from about 80 per cent at 15 m.p.h. to about 30 per cent at 50 m.p.h., as shown in Fig. 6.

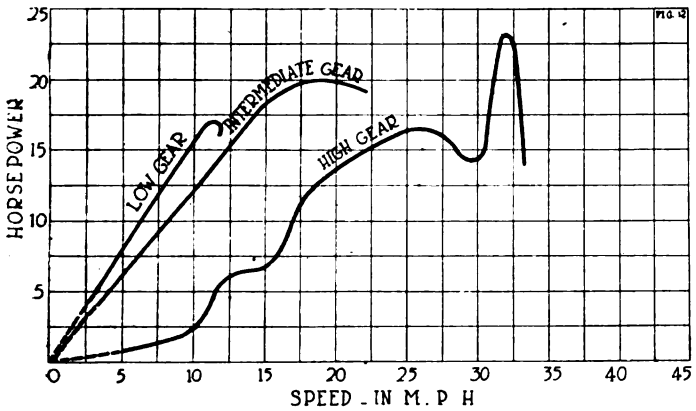

Fig. 12—Traction hp. of 4-cylinder car rated at 19.6 hp.

(d) *Brake Performance*—Fig. 7 shows that in this particular brake test the maximum deceleration was not reached until six seconds had elapsed from the time the brakes were first applied; that is, the retarding force was gradually increased, thereby eliminating the undesirable jar resulting from a sudden gripping of the brakes. The maximum deceleration was no higher than the *acceleration* of several cars when the throttle is opened wide and the gears are in low.

(e) *Traction Horsepower*—Figs. 8 to 12 show the differences in traction horsepower of various cars when running in high, low, and intermediate gears. In general, the maximum traction horsepower attainable is obtained by driving the car in intermediate gear. The low-gear maximum is attained at a slower car speed than the former and at a higher speed than that for the maximum traction horsepower when running in high gear. Fig. 8 shows a peculiarity in that the power curves for the low and intermediate gears are not directed toward the intersection of the co-ordinate axes over a large section of the curve. Fig. 9 shows the traction power curves for a 12-cylinder car. The proportionality of traction power to the speed is clearly brought out. It is interesting to note that at any given speed, within limits, the traction horsepower in low gear is double that in high gear. In Fig. 10 the curves for the 6-cylinder car No. 2 show a value somewhat greater than 2 for the ratio of low gear to high gear traction horsepower at any given speed, within limits.

Fig. 11 shows very poor performance, in that the traction horsepower with any gear ratio is very much below the rated horsepower of the engine. A closer study of power losses in this car should have been very profitable.

The irregularities in the curve for traction power in high gear for the 4-cylinder car are due to fluctuations

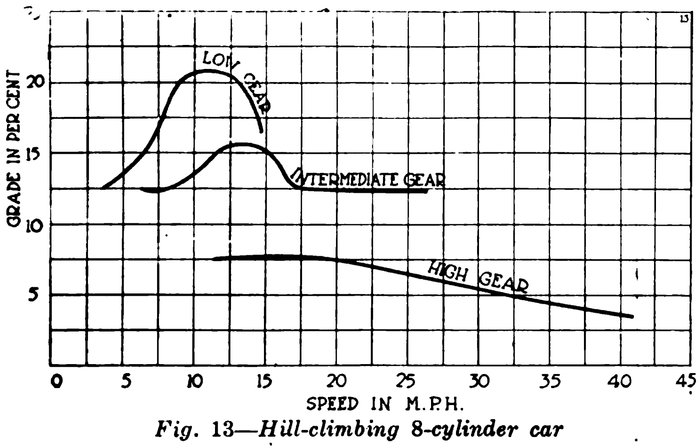

Fig. 13—Hill-climbing 8-cylinder car

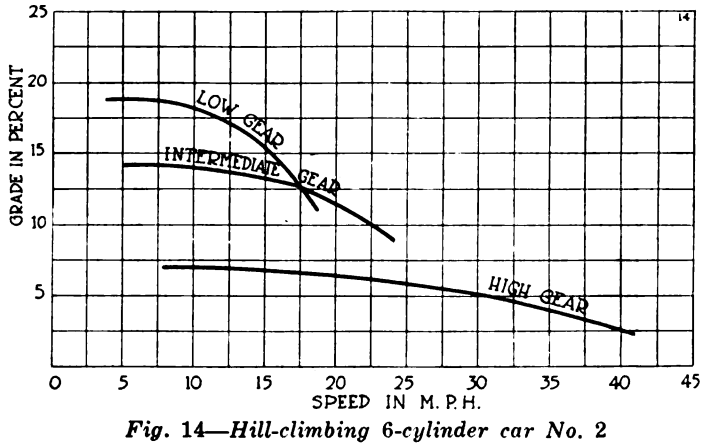

Fig. 14—Hill-climbing 6-cylinder car No. 2

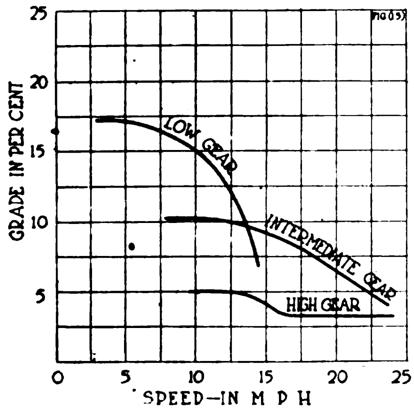

Fig. 15—Hill-climbing 6-cylinder car No. 1

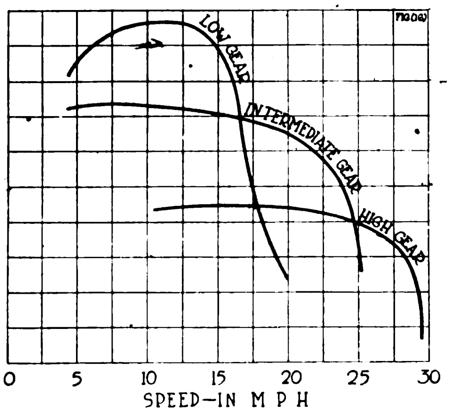

Fig. 16—Hill-climbing 12-cylinder car

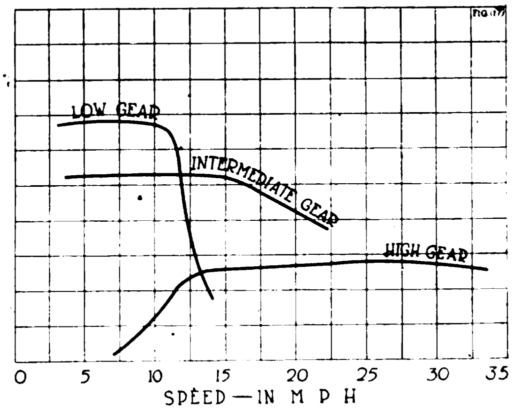

Fig. 17—Hill-climbing 4-cylinder car

in the acceleration brought out in Fig. 4. The traction power slightly exceeded the rated engine power for both the intermediate gear and the high gear runs.

(f) *Hill Climbing*—Fig. 13 shows that the 8-cylinder car can climb a grade of 21 per cent at a constant speed of 11 miles per hour. The curve is rather peculiar in that the maximum grade-climbing capacity is not attained until this speed is reached. The great reduction in ability to climb hills when running on high gear is very marked. The curves of Figs. 14 and 15 for the 6-cylinder cars are different from the curves for the 8-cylinder car in that they have maxima at the speeds at which the tests were begun. The curve for the run of the 12-cylinder car in low gear in Fig. 16 shows the highest grade-climbing capacity of all cars tested, in that this car can make a 24 per cent grade at a constant speed of 14 m.p.h. Fig. 17 shows the curve for the 4-cylinder car. The high-gear curve is only approximate, but the low-gear curves are quite accurate, and show a constant grade-climbing ability over a considerable range of speed.

The author believes that the data obtained with the apparatus the Research Division developed for recording the speed of a car under acceleration or deceleration, when operated upon with a differentiating machine, yield information that should be of value in improving car design. The power rather than the acceleration curves should be used to study car performance, because power measures energy consumption, while acceleration in itself does not. Energy consumption is identical with fuel consumption, and involves economy, while acceleration merely illustrates the behavior of the car from the point of view of kinematics, which is of more interest to the mathematician than to the engineer and car user.

Meso-Thorium as an Ingredient of Luminous Paint

THE increasing demand for radium for medical work, but more particularly for luminous paint, has made the question of possible radium substitutes of considerable importance. Radium luminous paint has been used in the war for a number of purposes, more particularly on the dials of instruments used on airplanes, so that these instruments can be read at night; for electric push buttons, door numbers and small images for shrines, etc. The paint is permanently luminous in the dark and contains from 0.1 to 0.25 milligrams radium element to one gram of zinc sulphide. A luminous watch face usually has from ten cents to twenty cents of radium on it.

An excellent substitute for radium for certain purposes is meso-thorium. This is a radio-active element found in monazite sand and other thorium minerals. When first extracted it is not in a satisfactory condition for luminous paint, but must be allowed to "ripen" for several months or even a year before it can be used. During this time the alpha radiation which is required for luminous paint becomes sufficiently strong. On the other hand the beta and gamma radiation of meso-thorium grows rapidly and it can be used for medical purposes within a few days after preparation.

Radium has a long life, half of it decaying in approximately 1600 years. Meso-thorium on the other hand has a short life, 5 or 6 years being its useful life for luminous paint purposes. The price in the past has varied from 40 to 60 per cent of that of radium, the comparison being on products of equal activity. For medical purposes therefore it cannot compete with radium as long as there is plenty of the latter; for luminous paint, to be used on objects which themselves have a short life, it is an excellent substitute for radium and will tend toward the saving of radium for medical purposes.

It undoubtedly has been used during the war especially by the Germans. Some of the first luminous watch dials in this country probably contained meso-thorium imported from Europe.

Until recently no meso-thorium was recovered in the United States, although large quantities of monazite sand are annually treated for the manufacture of incandescent gas mantels. Such a condition has represented an important mineral waste.

Shortly after the United States entered the war the Bureau of Mines made a co-operative agreement with the Welsbach Co. of Gloucester, N. J., for the study of methods of extraction and recovery of meso-thorium. The work was carried on at the Rocky Mountain station of the Bureau of Mines at Golden, Col., under the direction of Dr. R. B. Moore, superintendent of the station, Dr. Herman Schlundt being assigned to the detailed work on the problem. Successful methods of extraction and recovery have been worked out and connected up with the regular metallurgical processes of the Welsbach company. Meso-thorium is now one of the regular products made by this company. The next largest producers of thorium salts in the country about the same time became interested in the recovery of meso-thorium and worked out its own methods. Consequently at the present time meso-thorium is recovered from practically all the monazite sand treated in the United States.

The details of the work of the Bureau of Mines will be published later. A preliminary announcement was made by Dr. Moore in a paper given at the September meeting of the American Institute of Mining Engineers at Colorado Springs. Incorrect press reports of this announcement gave rise to some serious misstatements of facts, hence this statement.

The Bureau of Mines has never claimed the discovery of meso-thorium, as this element was first identified and described by Hahn in 1905.

Transatlantic Airplanes

NOW that the war is over and aircraft manufacturers are confronted with the problem of finding new outlets for their production we may soon see serious attempts made to cross the Atlantic Ocean. The cash prize offer of the London *Times* for the achievement, which was withdrawn during the war, has been restored, and work on machines which are to try the flight is reported from different centers. Thus our own Naval Aircraft Factory in Philadelphia is reported to be working on a flying boat for the purpose. The Grahame-White Co. of England is advertising for the services of an experienced navigator who is also a pilot to undertake the journey on a machine now being built. At the Farman works in Boulogne-sur-Seine a giant commercial type of airplane, referred to as the Goliath, has recently been completed. It is said to be capable of the Atlantic voyage when fitted with floats. It is capable of carrying 20 passengers, making 100 miles per hour and to travel 1900 miles on one supply of fuel.

We are informed that at the Bleriot works two new large four-engined aeroplanes are nearing completion, which will, it is expected, be suitable for aerial transport in the colonies, where roads are none too good and railways non-existent. In such cases the aeroplane will link up by postal air service one colony with another, and with the capital, while numerous other spheres will doubtless be found, in which the large weight-carrying aeroplane will be of inestimable service.

What Should Organization Achieve?

It Should—

1—Pr vide Incentive to Work
2—Settle Individual Grievances
3—Settle General Disagreements
4—Improve the Working Force
5—Decrease Labor Turnover
6—Reduce Friction Between Departments

By Harry Tipper

SOME time ago the various branches of one of the important industries in this country were involved in continual disputes and in a form of competition which was very destructive in its character.

It occurred to a few of the leaders in this industry that a co-operative organization, formed of the various branches by the election of a few delegates from each branch, would provide machinery by which these disputes would be ironed out and action taken.

The organization was formed. In its character and constitution it was not binding upon any of the branches, or their individual concerns, to agree to any of the decisions made.

When it had been operating for about three years, an examination of its files showed that only three cases had been brought to it which had required regular record decision and promulgation of the decision. The disputes and disagreements, which had filled the air so much before the organization was formed, had vanished without the registering of any complaint when the machinery had been running for a little time.

Some of the members were inclined to question the value of this organization because it did not appear to be doing much work. The fact was, its greatest work had been accomplished in providing a common meeting place with regularly scheduled occasions for meeting at which the disputes of the various branches of the business had died away in a measure of understanding.

These meetings are still being held regularly, although they do not take up very much time, because it is generally understood by the individual concerns in the industry that the better understanding which prevails between the different branches is due to this co-operative organization and it must be maintained by the same means.

Number of Cases No Criterion

In considering the success of co-operative industrial organization, created within the industrial unit for the purpose of settling the matters of disagreement, it is obvious that the number of cases which have been settled is no criterion as to the value of the work and in some of those organizations, where the machinery for the settlement of these matters has been in existence for the longest period of time, the number of cases called to the attention of the organization becomes smaller each year.

What, then, should come out of the efforts of such an organization in order to justify it industrially, after it has been working three or four years?

It is obvious that it should provide a greater incentive to work and to remain at work in the same establishment.

It should show evidence of having settled individual grievances and reduced the number of those grievances.

It should show evidence of having settled general disagreement upon wages and hours, and having reduced the number of such disagreements, or, at least, settled them amicably without the interruption of production or the formation of strikes.

It should also show evidences of providing permanent machinery for the improvement of the working force, for important matters of welfare and for the development of other activities for the mutual benefit of the concern and its employees. This evidence would accumulate in the form of a decrease in the turnover of the labor, this showing gradually in the operation from year to year; a decrease in the friction between departments and employees, as evidenced by the reduction in the number of cases of personal grievances; an adjustment of the wage question by amicable arrangement, and the operation of the welfare department by the employees themselves in just and proper relation to the concern's necessities.

Of the several concerns whose co-operative organizations have been established along the lines outlined in the last article, some of these have been operating for a sufficient length of time to make it possible to examine the records and determine the relation which they bear, in their industrial results, to the former condition.

The Effect Upon Turnover

In one of these organizations, where the experiment has been tried for four years, the turnover has been reduced so that instead of 40 per cent of the number of employees having a record of more than six months continuous work 80 per cent of the employees now qualify under that requirement. This has meant a very large reduction in the turnover and a very great increase in the stability of the organization.

It has, of course, shown itself also in the marked difference in the spirit of the various departments where the stability of labor has introduced a co-operative spirit greatly to the benefit of the productive capacity of each department. This important factor is again increased in its value when examination is made of the action taken by the organization upon the question of wages in general and upon the question of individual increases.

The Adjustment of Personal Grievances

The record of the adjustment of personal grievances is not in such shape that it can be determined with accuracy from the statistics. A careful examination of the matter indicates that these personal grievances have decreased to such an extent that the Betterment Committee, or the Board of Review, by whichever name it happens to be called, is rarely required to enter into this question at the present time.

It is indicated from the conversation of the heads of departments and the officers of the company that the personal grievances are more freely discussed between the employee of a department and the supervisor and settled more largely in that amicable way, without being brought to the organization machinery for decision.

It is perhaps principally in the matter of discharges that the greatest progress has been made. As stated in the last article, there are certain causes for which an immediate discharge without the right of review is retained, and the experience is that the discharges from these causes have decreased very greatly since the establishment of the judicial machinery, so that they are now very infrequent.

It has been noted, further, that the establishment of the committee empowered to review the discharge of any person, not guilty of one of the offences stated above, has had the effect of eliminating the discharges for trivial causes, which, while infrequent, were unnecessary.

It has also improved the morale in each department by the feeling of confidence engendered by the knowledge that the employee has the right of review and the fair and careful investigation which has preceded the decision in each case. While the statistics are not available, it is gathered from conversation with various department heads that the reduction in discharges of this kind amounts to a little more than 60 per cent of the total number over a given period.

Wage Adjustments

It is in the matter of wage decisions, perhaps, that this type of organization receives its greatest justification in those individual industrial units where it has been tried out. In four years, in one unit, eight decisions have been made upon the wage question without involving a strike, without interrupting the orderly process of production and without the turmoil and lack of confidence which usually arise in such cases.

It is to be noted that, in this number of cases, there were three decisions affecting wages and raises in the first year, two decisions in the second year and one decision in the third year, which finally led to the establishment of a permanent committee to deal with that question exclusively and the establishment of a basis which automatically settled the general system upon which wage increases would be allotted.

Any one of these decisions would have been sufficient to cause a strike in many plants, or greatly reduce the productive efficiency, create dissatisfaction among the workers and increase the turnover and the loss of production.

It should be remembered, in considering these decisions, that they were made by the full discussion of the combined representatives of the general employees and the representative department heads and supervisors, so that they were the result of a full and free discussion between the parties at interest who were familiar with all the details of the case.

To the writer the most remarkable thing is the fairness exhibited by the records of the discussions and the resolutions passed, and the fact that such discussions have gone much further, in actual understanding of the employer's position by the employee, and vice versa, than any of the discussions which have occurred and been brought to his attention between the general organized labor groups and the groups of manufacturers.

The operation seems to have worked out in this general way: The employees who felt that they were entitled to an increase in wages, change in the hours, extra holidays, or something of that kind, presented the matter to their representative. The representative, better informed as to conditions on account of his contact with such questions through his participation in the discussions of the house, would be able to secure a modification of these demands before the final instructions were given to him to be presented to the house of representatives.

When such instructions were taken upon the floor of the house of representatives, all other departments would be able to further modify the demands in their full discussion of the matter from all points of view.

The presentation of the matter to the senate would then result in further modifications unless the matter was already cleared, so that when the matter was finally presented to the company the proposition represented a fair basis for action.

It is in this respect indeed that the organization has justified itself more strongly than in any other respect and that the use of the supervisors and heads of departments, as a second body, has been justified more thoroughly.

The general executives could not inform themselves readily upon the total advantage and disadvantage of any course of action, and matters could not be brought out so freely in discussion before a decision was to be made.

By the interposition of the body of department heads, the total disadvantage and advantage in operation have been thoroughly threshed out and the matter brought into some general co-ordination with the development and interests of the business before being passed up to the heads of the firm for final action.

The records show that the employees have secured wage increases a number of times in common with all other employees. They also show, however, that they have agreed to take care of wage increases on a more permanent basis and upon better grounds than the average industrial organization. They have created permanent machinery to deal with the question which will give them an opportunity to improve and develop the matter upon the basic principles already admitted in these dealings between the workers and the individuals of the same industrial unit.

Information. By Harvey E. Phillips. Auto Electric Systems Publishing Co., Dayton, Ohio. Price $2.50.

This is a volume of some 400 pages, containing very elaborate information on elementary electricity, motor car electric systems, the gas engine from an ignition point of view, and driving the car. Mr. Phillips has had extensive experience with the Bell Telephone Co., the Dayton Engineering Laboratories Co., and has been consulting engineer to Aviation Mechanics Training School. He has also published a number of smaller booklets on electrical subjects, especially pertaining to automobile ignition.

In the present book not only are the elementary principles of electricity taken up and thoroughly explained, but the different systems are gone into in detail and there is a considerable amount of information given on driving the car correctly. In the next part of the book are published a considerable number of wiring diagrams of starting, lighting and ignition systems on automobiles up to and including 1917 models.

AT the annual meeting of the German Association of Gas and Water Engineers, which was held in Berlin recently, the question of the continued demand for coal gas for road vehicles after the war was discussed. The belief in a future increasing demand is based chiefly on the shortage of horses. There are, however, also, other advantages connected with the use of gas. Experience in Berlin with a 3-ton motor truck shows that the consumption of gas is about one cubic meter per kilometer, or 60 cu. ft. per mile of travel.

Left-Side Drive for Export Cars

Difficulties Involved in Building One Model in Both Right and Left Hand Drive Types—The Left-Hand Drive Has the Same Advantages in Most Foreign Countries as Here—Action by N. A. C. C. Suggested

By A. C. Woodbury

ONE of the serious difficulties connected with export business as conducted by the average American automobile builder during the past few years has been the demand for right-hand drive in most of the world outside America. Catering to this demand is the cause of much expense and inconvenience throughout the whole history of a model.

When the design is first laid out on the drafting board it is necessary to provide clearance for the steering gear on both sides of the engine, often either causing the shifting of engine accessories from one side to the other, or preventing the best arrangement that would be possible if the position of the steering gear were fixed. Many times resort is had to expedients on control rods, brake connections and exhaust pipes for right drive models that would not add luster to the reputation of the engineering department were the stripped chassis exhibited to the critical gaze of a National show. From the inception of the design to the time when the last "right drive only" part is sold for service the production of right drive cars concurrently with left drive cars is a source of bother, errors and expense. With the market of the world in its present state it is worth while now to consider whether the demand for right drive cars has really any basic foundation which must be respected, or whether it is one of those bugbears for which we have entertained a groundless fear.

The prevalence of right drive in foreign countries is often ascribed to the different rule of the road requiring meeting cars to turn to the left instead of to the right and causing all vehicles to keep to the left side of the road. That this is not a really serious reason is seen from the fact that for years almost every car built and sold in this country with its turn-to-the-right rule had right-hand drive. Also several instances are on record of models brought out with left drive, later to be changed to right drive because the public demanded the arrangement to which it was accustomed. In France, where the rule of the road is the same as our own, the right drive still prevails.

Advantages Claimed for Left-Hand Drive

It is true that many drivers will tell you that the left drive is the best because they can see best from the left position how close to drive to a car they are meeting, but it is equally true that the right position enables them to better judge the distance to the edge of the finished surface of the road and the clearance from cars or teams they are passing, while there is also a little gain in getting sooner out of the dangerous zone in meeting a glaring headlight. None of these arguments are the determining ones. To find the real reason for the change from right to left drive in this country we will recall a little history.

Eight or nine years ago nearly all cars had right drive, and the front compartments were not enclosed by doors. At about this time the "fore door" body made its appearance, after being introduced by early attempts at stream line or "gun boat" bodies. Up to this time the right side of the driver's seat was usually quite inaccessible. The brake lever, gear shift lever and steering wheel were too much in the way to permit easy ingress or egress, and spare tires usually completed the enclosure. So there was no compunction against providing only one real door in the front compartment and closing the right side by a panel.

However there was real difficulty in arranging the control levers so they were accessible and sightly without encroaching on the position of the driver. Some designers put both levers outside where they were both inconvenient and unsightly, others placed them inside, resulting either in cramping the position of the driver or making an unsightly bulge in the body, while still others compromised by putting one lever inside and the other outside. This compromise was even worse than the others as to knuckle clearance. One maker went so far as to enclose the gear shift lever in the body panel with an elongated gear shift gate in place of the molding at the top.

Control Levers Moved to Center

Next, one or two manufacturers hit upon the scheme of mounting the control levers in the middle, directly on the transmission in the case of a unit transmission, but still kept the steering wheel at the right, making it necessary to shift gears with the left hand. This position of the levers was a happy thought. It not only got well clear of all interference between body and levers but it proved a simpler and better manufacturing arrangement than mounting the levers independently on the frame.

While many cars requiring gear shifting with the left hand have been manufactured, and those who are accustomed to them say they are just as convenient as any, still the public generally seems not to have taken kindly to the idea and the logical step was to move the position of the driver to take full advantage of the newly found best position of the control levers. The majority of American manufacturers seem to have reached this conclusion at once, as most of them changed to left drive and center control the same year.

If this arrangement is such an advantage in American cars why has it not been taken up by the leading European makers? I believe that is largely because of the different organization of the industry in Europe, particularly because the cars are not ordinarily built with standard bodies. The result is that problems of the body builders do not so promptly react on chassis design. I believe Europe will eventually follow America's lead in this respect.

It thus appears that the reasons for left drive for export cars are about the same as for cars for domestic use, with the additional reason that any such extensive change in the design of part of the product of a factory causes much greater confusion and expense than would

Six-cylinder 200-hp. Austro-Daimler engine. Cylinder dimensions, 135 x 175 mm.

Austro-Daimler 200-Hp. Aircraft Engine

Report on an Austrian Aircraft Engine Issued by the Technical Department of the British Air Ministry—The Engine Described Was Fitted to a Berg Single-Seater Scout

THE following detailed report on the design, construction and general performance of the latest type of Austro-Daimler engine is based on an examination and tests carried out at the R. A. E. on the engine (No. 19,218) taken from a captured Austrian Berg scout (R. A. F. No. A. G. 6). This machine, a single-seater biplane brought down on the Italian front in April, 1918, was captured in very good condition; the engine had apparently only been in use for a few hours.

With the exception of its high stroke—bore ratio—and the construction of a detachable inlet valve seating in each cylinder, the design of this engine shows no great resemblance to the earlier types of Austro-Daimler engines; generally speaking, the new 200-hp. Austro-Daimler possesses more than the usual amount of originality in design found in aircraft engines.

The general construction of the 200-hp. Austro-Daimler is shown in the photograph of the complete engine, Fig. 1, and also in the accompanying cross-sectional and general arrangement drawings.

Following the usual German practice, the engine is of the six-cylinder, vertical, water-cooled type with separate built-up steel cylinders. The principal characteristics of the design and its general performance are given in the following leading particulars:

Number of cylinders	Six, vertical.
Bore	135 mm.
Stroke	175 mm.
Normal b.m.e.p.	123.3 lb. per sq. in.
Average b.h.p. and speed	200 b.h.p. at 1400 r.p.m.
Compression ratio	5.02:1.
Fuel consumption per hour	111.0 pints.
Fuel consumption per b.h.p. hour	0.555 pint.
Oil consumption per hour	7 pints.
Oil consumption per b.h.p. hour	0.035 pint.
Total weight of engine, dry	728.5 lb.
Weight per b.h.p. (normal)	3.64 lb.

High Compression Ratio

The compression ratio is considerably higher than that of any of the enemy engines except the Maybach, and from the complete data published at the end of this report it will be seen that the general efficiency of the engine is good, the hp. per cu. ft. of stroke volume being 377.3 and the hp. per sq. ft. of piston area being 216.6.

During calibration and endurance tests carried out at the R. A. E. the running of the engine was very good, being very steady and between 700 and 1700 r.p.m. The engine was remarkably clean, having no trace of oil or water leakages during tests.

Compared with the usual high weight standard of enemy engine design, the weight per b.h.p. of 3.64 is quite normal. From our own standard of weights, however, the weight per b.h.p. is disproportionately high. This is chiefly due to the heavy construction of the crank chamber and oil base, rather than to the design of the cylinders and reciprocating parts, which are well designed and are of light construction compared with other enemy engines.

As a preliminary survey of the general design of the 200-hp. Austro-Daimler engine, the principal features of the engine are briefly described and illustrated in the following summary:

The six separate cylinders are of the usual built-up steel construction with pressed steel water jackets and are fitted with twin inlet and exhaust valves in the cylinder heads, which are integral with the cylinder barrels. The valve pockets are welded into position, with the exception of one inlet valve pocket in each cylinder, which is constructed so as to be easily detachable with its valve seating and guide, as in previous Austro-Daimler engines, so that all the valves can be removed without dismounting the cylinder.

Aluminum pistons are adopted, and, with the exception of those recently fitted to the 230-hp. Benz engines, were at the time of capture apparently the only aluminum pistons in use in enemy engines, although since this engine was captured a Rumpler biplane has been brought down fitted with a 270-hp. Bassé-Selve engine using aluminum pistons. A detailed report of this engine is in course of preparation and will be published shortly.

The H section connecting rods are of normal design, and the crankshaft runs in seven white metal bearings, which are carried by the top half of the crankcase. The bottom halves of the journal bearing housings are steel forgings and are very deep in cross section, being similar in design to the journal bearings fitted to the Maybach engines.

The design of the valve gear and camshaft drive presents several interesting details. As shown in the illustrations of the engine, the overhead camshaft is driven by a vertical shaft off the front end of the crankshaft. The camshaft runs in four phosphor bronze bearings in the center of an aluminum camshaft case.

A compression release gear, very similar to the Mercédès type, is provided. The water circulation passage from the cylinders to the top of the radiator is taken through to the front end of the cast aluminum camshaft-casing, just behind the driving bevel gear.

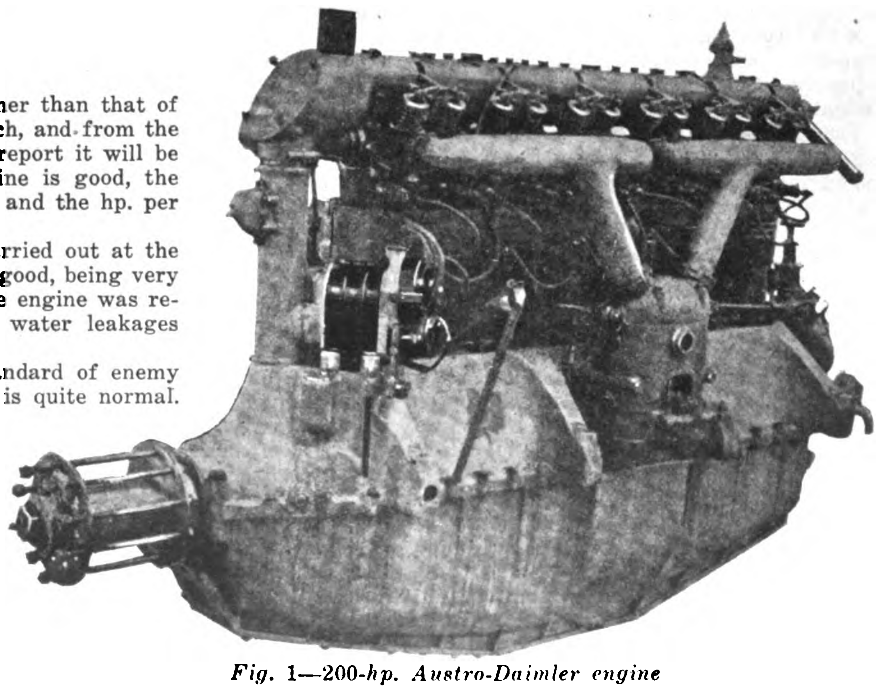

Fig. 1—200-hp. Austro-Daimler engine

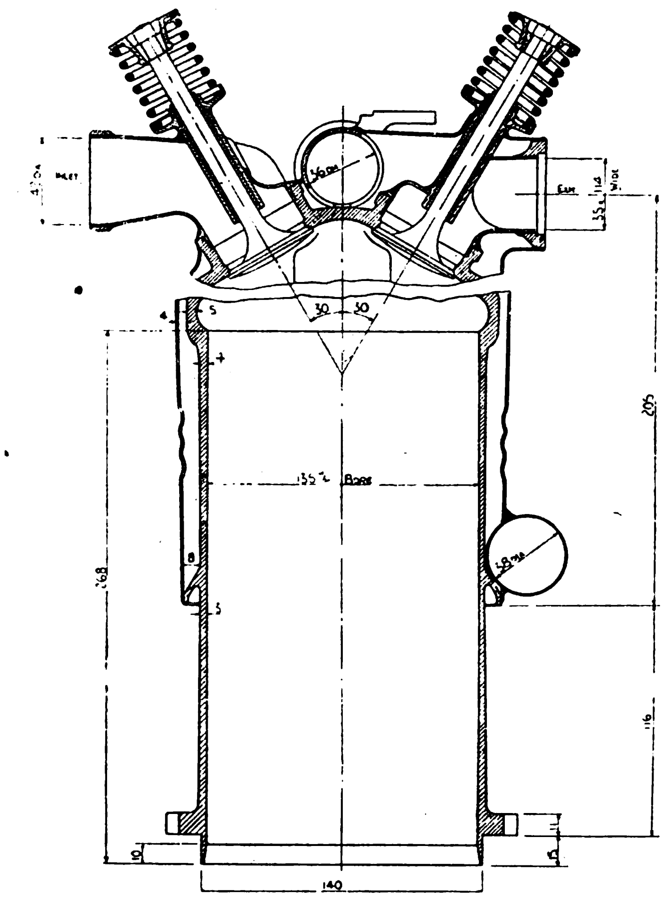

Fig. 2—Cross section of cylinder

A reciprocating plunger type oil pump is fitted in the front end of the oil base. This pump is driven by bevel and worm gearing directly off the crankshaft and is unusually heavy, but of interesting design.

The lubrication is on normal principles and embodies a large air-cooled oil sump at the bottom of the base chamber, which is supplemented by an auxiliary fresh oil reservoir cast in the front end of the top half of the crank chamber. The fresh oil is delivered by a small auxiliary plunger, working in conjunction with the main oil pump, to the front end of the camshaft, the lubrication of which is well carried out.

A "V" type honeycomb radiator is fitted directly behind the propeller, and the centrifugal water pump, which is driven obliquely off the rear end of the crankshaft, is of ordinary design.

Two Bosch Z.H.6 magnetos are driven diagonally at 52 deg. off the vertical camshaft driving shaft at the front of the engine, and two plugs are provided in each cylinder. The magneto controls are interconnected with the throttle control, so that the ignition is automatically retarded when throttling down.

A heavy duplex carbureter feeds the cylinders through two separate steel induction manifolds, which are galvanized, and lagged with asbestos; each manifold feeds three cylinders. The carbureters are water-jacketed and heated by the cylinder water circulation system in the usual way.

Main and slow-running jets are fitted, the two annular floats being housed in chambers surrounding the choke tubes. The main air intake is taken through a passage cast in the two halves of the crankcase, leading to the chamber below the false bottom of the oil sump.

An air pump of the spring plunger type is driven off the camshaft and is mounted on the top of the camshaft casing toward the rear end of the engine. A transverse shaft driven off the rear end of the crankshaft carries two cams for the synchronized gun interrupter gear. No exhaust manifold is provided, each cylinder being fitted with a short streamline section exhaust pipe about 12 in. long, as shown in the illustrations of the engine.

The six separate cylinders are made entirely of steel. The cylinder barrels, which are integral with the heads, are built up of steel forgings. The barrels are machined all over, and are ground to 135 mm. bore; the thickness of the cylinder walls tapers on the outside from 3.0 mm. at the center to 4.0 mm. at the top, and 4.0 mm. at the base. The water-jackets are pressed in the usual way from sheet steel 1.0 mm. thick, and are very short. The bottom of each water-jacket is flanged over and welded to a beveled flange which is machined on the cylinder barrel; three annular corrugations are formed in the water-jackets to allow for expansion.

Two inlet and two exhaust valves are fitted in each cylinder head, and work at angle of 30 deg. to the vertical axis of the cylinders. These are clearly shown in the cross-sectional drawings of the cylinder, Fig. 2.

In each cylinder two of the exhaust pockets and one of the two inlet pockets are pressed and welded into the head. The other inlet valve, with its seating and guide, is carried in a separate detachable pocket, fixed in position by a large gunmetal union nut, as in previous Austro-Daimler and Beardmore engines. This allows the other valves to be withdrawn from the cylinder through the opening left on the removal of the pocket, without disturbing the cylinder.

The flanges at the base of the cylinders are 11.0 mm. thick, and the cylinder spigots extend 15 mm. into the crankcase. Lugs are machined in the base flange of each cylinder to take the eight studs which bolt each cylinder to the crankcase. Four of the studs are of larger diameter, *i. e.*, 19.0 mm., and pass through the crankcase upper half; they act as main holding-down bolts and secure the lower portion of the journal bearings, thus relieving the crankcase of most of the working stress.

The total weight of each cylinder, bare, is 18.4 lb.

Pistons

These are of cast aluminum; the crowns are very slightly concave, and are supported by eight radiating ribs, as shown in detail in the sectional drawing, Fig. 3. It will be noticed that these ribs are not spaced equidistantly, the two ribs over each of the piston pin bosses being closer together and extending downward so as to support each boss from below.

This design undoubtedly provides a much better distribution of the stress than in the design of the new 230-hp. Benz aluminum pistons. Steel bushes are cast into the piston pin bosses in the pistons, and the piston pin is fixed only by a large split pin, which passes through a hole drilled in the boss; these holes are also fitted with steel bushes.

Three plain cast-iron rings are fitted above the piston pins, and an annular groove is machined around each piston on the piston pin level for lubrication.

The weight of each piston is 3.52 lb. with rings, and the weight of each piston pin is 0.66 lb.

The connecting rods are of H section and exceptionally long for the size of the engine; from the German standard of

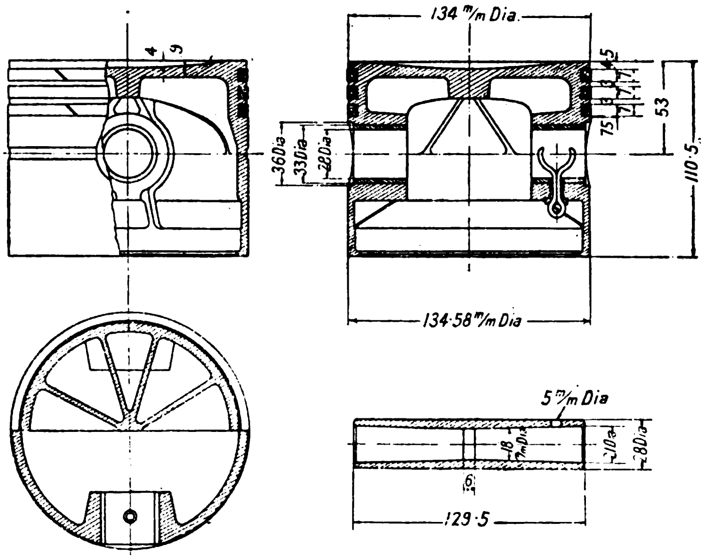

Fig. 3—Piston and piston pin

weight they are of comparatively light section, but the central webs of the rods are not drilled. Four bolts are used to hold the halves of the big-end bearings. These bolts are 10 mm. dia., and each pair is locked by a sheet steel clip.

The white metal lining of the bronze big-end bearing shells is 1 mm. thick, and the small ends are fitted with phosphor bronze bushes for the piston pin bearings, which are lubricated by small diameter pipes attached to the central web of the rods in the usual way. Two horizontal oil grooves are cut in the lower halves of the big-end white metal bearings, and a short transverse oil groove in the top halves, while the small-end bushes are provided with three longitudinal oil grooves.

Weight of the complete connecting rod.. .... = 4.84 lb.
Weight of big end .... = 3.18 lb.
Weight of small end .... = 1.66 lb.
Length of connecting rod between centers...... = 315 mm.

Valves and Valve Gear

The twin inlet and exhaust valves are all of the same dimensions and are interchangeable, and, as previously mentioned, work at 30 deg. to the vertical cylinder axis. The largest diameter of the valve heads is 48 mm., and the effective diameter is 44 mm., which gives a combined inlet valve opening area of 4.24 sq. in. The mean gas velocity through the inlet valves is 140 ft. per second.

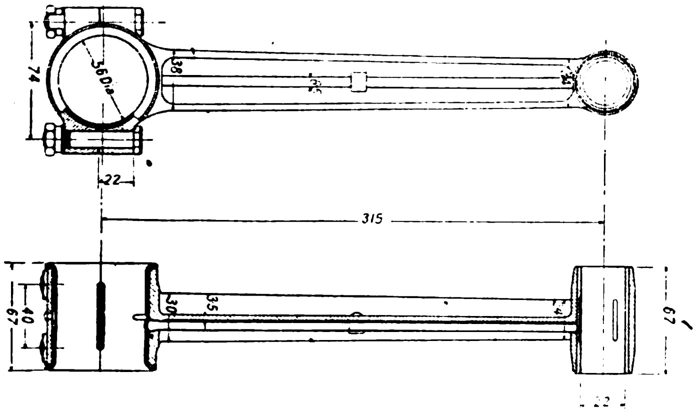

Fig. 4—Connecting rod

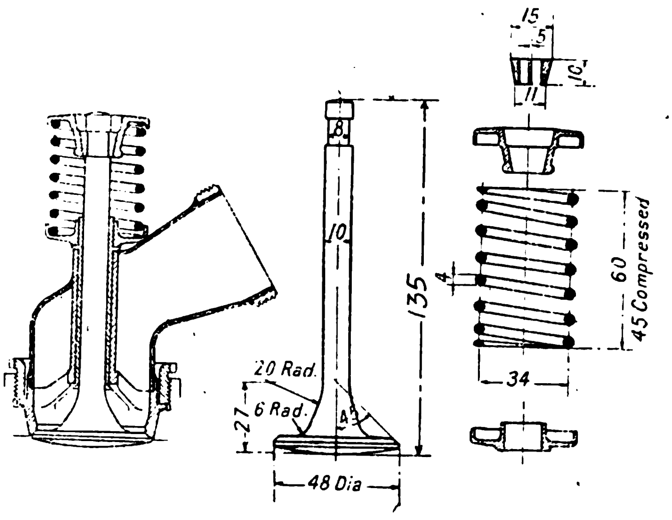
Single helical valve springs are fitted to each valve, and the valve spring collars are held in position by split cones, which register with the recess cut in the end of the valve stem, as shown in Fig. 7. This spring locking device is similar to that used in the Benz engines. The valves are operated by a single overhead camshaft which is carried in an aluminum case, running the whole length of the engine in one piece. This case is attached to each cylinder by two studs screwed into lugs formed in the cylinder heads.

The camshaft runs in four phosphor bronze bearings; these bearings are split and mounted in aluminum housings, and are located in the camshaft casing by small taper grub screws. The cover of the camshaft is in three parts, with very close joints. These detachable covers permit easy access to the valve gear of any or all of the valve rockers and cams.

Valve Rocker Spindle

Each valve rocker spindle is carried in three separate phosphor bronze bushes, which are housed half in the lower portion of the aluminum camshaft casing and half in the camshaft case cover. For ease of manufacture the boring of the cover and case is carried out as two continuous holes running the whole length of the case, and forming long semicircular grooves in both halves, in which the valve rocker spindle bearings lie. These bearings are held in position by dowel pins, and the center bearing of each set is of course split.

With the exception of the bridge pieces, which operate the valve stems, the valve rocker levers are machined from single steel forgings, and the bridge pieces, which carry the adjustable tappet screws, are pressed and riveted on to the ends of the rocker arms against a shoulder. The bridge pieces are prevented from swivelling by being let into a recess cut in the base of the shoulder. The ends of the adjustable tappet screws are hardened and are fitted with the usual type of transverse locking bolt.



Figs. 5, 6 and 7—Valve seat, valve and spring

Hardened steel rollers are fitted to the inside arms of the rocker levers, and a deep oil groove is milled in the top of these arms to convey oil through the hollow spindles to the bearings and also to the cam rollers.

Camshaft Driven from Front End

Compression release cams are formed on the exhaust cams, and the lateral movement of the floating camshaft is effected by a long hand lever at the rear end of the engine. This lever is attached to a gun-metal collar, which is fitted with a square thread screw, the design of this compression release gear being very similar to that used on all the Mercédès engines.

The camshaft is driven from the front end (which is quite unusual in enemy engines) through a bevel gear, which floats on eight splines cut on the end of the camshaft. The camshaft vertical driving shaft is driven directly from the front end of the crankshaft by bevel gears. The top end of the vertical spindle runs in a combined thrust and radial bearing, and the lower end (which has six splines cut in it) floats in the lower bevel gear, which with its bearing and housing forms a separate unit, and need not be disturbed when withdrawing the vertical spindle.

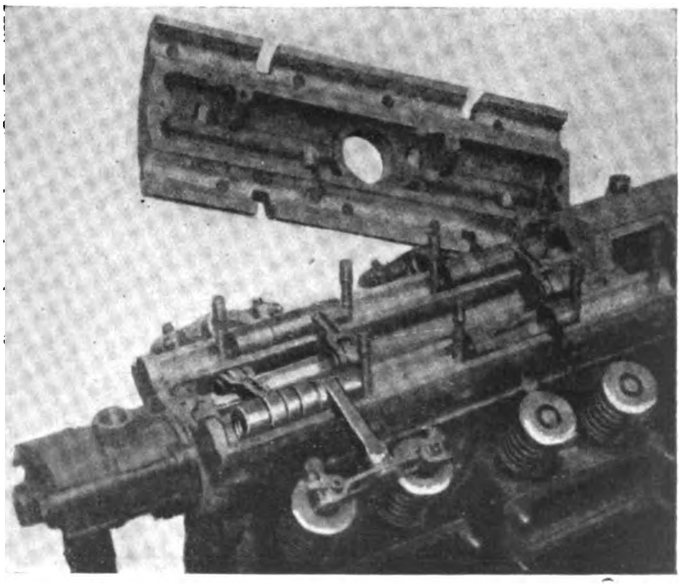


Fig. 8—Camshaft and housing, with cover removed

Details of Crankshaft

Number and type of main bearings	Seven bronze cage, lined white metal
Cylinder centers	166.0 mm. (6.53 in.)
Journals	
Outside diameter	58.0 mm. (2.28 in.)
Inside diameter (front two)	21.0 mm. (0.82 in.)
Inside diameters (others)	30.0 mm. (1.18 in.)
Length airscrew end	56.0 mm. (2.20 in.)
Length rear end	43.5 mm. (1.71 in.)
Length center	50.0 mm. (1.97 in.)
Length intermediate	50.0 mm. (1.97 in.)
Crankpins	
Outside diameter	56.0 mm. (2.20 in.)
Inside diameter	30.0 mm. (1.18 in.)
Length	68.0 mm. (2.67 in.)
Crank Webs	
Width	74.0 mm. (2.91 in.)
Thickness (front two)	24.5 mm. (0.96 in.)
Thickness (others)	24.0 mm. (0.94 in.)
Radius at end of journals and crankpins	4.5 mm. (0.17 in.)
Weight of complete shaft	96.5 lb.

The six-throw crankshaft is of normal design and requires little description. The usual type of plain white metal bearings are used. The diameter of the journals is 58 mm. and of the crankpins 56 mm.; the length of all the journal bearings is 50 mm., with the exception of the front bearing, which is 51 mm.

All the crankpins and journals are bored 30 mm. dia., except the two front journals, which are 21 mm. bore; and the webs are drilled with 5 mm. oil leads in the usual way for pressure lubrication. Brass discs are used to plug the ends of the holes bored in the journals and crankpins. These are expanded into grooves cut in the ends of the holes. Other details of the design of the crankshaft are given in the drawing, Fig. 9, and the construction of the front ball bearing and propeller double thrust race is clearly shown in the general arrangement sectional drawing of the engine on page 20.

Propeller Hub

The method of attaching the airscrew hub by serrations cut on the outside of a sleeve which fits onto the tapered extension of the crankshaft follows the original design of the previous Austro-Daimler and Beardmore engines. In other respects the construction of the airscrew hub is of ordinary design, but compared with those used on most other enemy engines the weight of the airscrew hub is considerably below the average—viz., 11.3 lb.—less the crankshaft extension. Details of the propeller hub are given for reference in Fig. 10.

Crankcase (Top Half)

The construction of the cast aluminum crankcase is proportionally heavy, both in the design of the top and bottom halves. The top half weighs—with main journal bearings complete and cylinder holding down bolts and studs—133.4 lb., and the bottom half, which forms the oil base and sump, weighs no less than 73.5 lb. dry. This makes a total weight

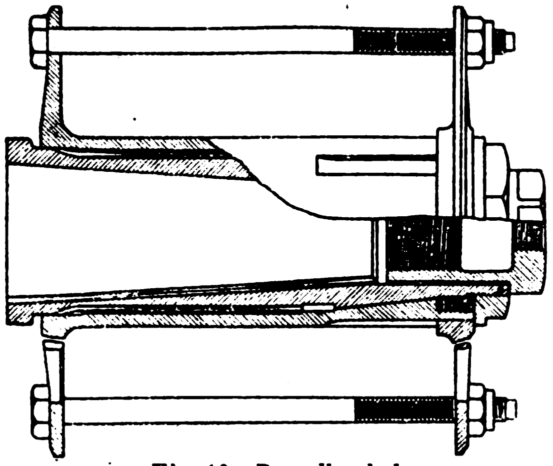

Fig. 10—Propeller hub

of 207 lb., approximately, for the complete crank chamber, which works out at 28 per cent of the total weight of the engine.

The transverse webs which form the crankshaft journal bearing housings are of the usual box section, and the eight engine bearer arms cast on the crank chamber, four on either side, are made as continuations of the transverse webs, and are of the same section; they are exceptionally deep.

The front portion of the top half of the crankcase is constructed to form the feed oil tank. This tank, as shown in the section on the general arrangement drawing of the engine, encloses the bottom portion of the camshaft vertical driving shaft, and is fitted with a filling cap and oil filter and also with a glass sight-level oil gage. The capacity of the feed tank is approximately one gallon.

The efficient ventilation of the crankcase, as in most of the enemy engines, has been well provided for. Two breathers of normal design are fitted on the exhaust side of the crankcase, and a passage is formed in the body of the carbureter, which communicates with the interior of the crank chamber through a large port cast in the side of the crankcase.

This passage also communicates with the crank chamber by two large holes cast in the webs of the central bearing housing. The primary function of this passage is, of course, to assist in heating the carbureters, which are also water-jacketed.

The average thickness of the walls of the crank chamber is 9 mm. *(To be continued)*

In view of the wide public interest taken in the British Scientific Products Exhibition, held at King's College, London, during the past summer, the British Science Guild has decided to organize another exhibition next year. The main object of the exhibition will be to stimulate national enterprise by a display of the year's progress in British science, invention and industry. A large part of the recent exhibition has been transferred to Manchester, where it will be on view at the Municipal College of Technology toward the end of next month.

Effect of Temperature on Spark Plug Insulations

Experiments Carried Out in England Show That Minimum Permissible Insulation Resistance Varies with Frequency of Sparks and Compression Pressure

IN a recent issue of AUTOMOTIVE INDUSTRIES was published an article by Dr. Cunningham on the effect of temperature on the insulation of spark plugs. This subject is of considerable interest in connection with aircraft engines, as these operate at high compression, and all parts exposed to the flames reach extraordinary temperatures.

The subject seems to have received some attention also in England, and a brief article dealing with it is published in *Engineering* of Nov. 8, by J. D. Morgan. Mr. Morgan divided his investigation into two parts, the first relating to the leakage resistance of the insulation which would just prevent firing of the plug, and the second to the variation of the insulating properties of different plug insulators with temperature.

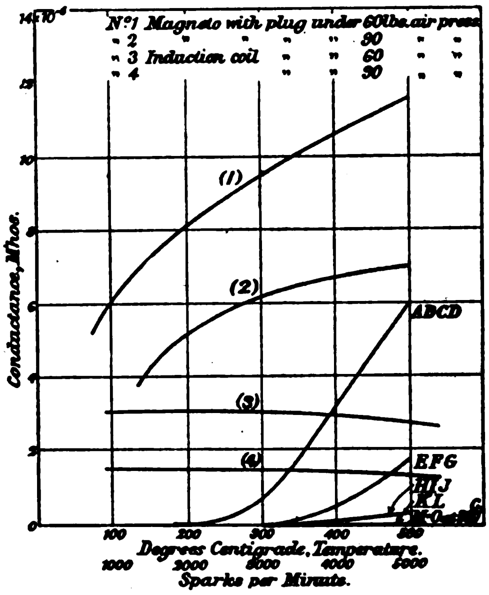
For the purpose of determining the leakage resistance which would just cause a spark plug to fail, a plug was secured to a compressed air chamber (of the kind frequently used for testing plugs and spark generators) and in parallel with the plug was arranged a variable water resistance. This system was connected in turn to a magneto and an induction coil, and the resistances just capable of putting out the spark at different speeds were measured by a "megger." Each apparatus was tested with the plug gap under air pressures of 60 lb. and 90 lb. per sq. in., the sparking voltages being respectively 6400 and 8800. Mr. Morgan states that the magneto was capable of overcoming a larger plug leakage than the induction coil.

In the test of the plug insulations, each plug was tested as a whole, that is to say, with the insulation contained in its metal body as in service, and each plug in turn was heated in a small electric muffle. A "megger" was connected by wires with the central electrode and the body, and the temperature of the muffle interior was indicated by a thermocouple instrument. Before each test, the plug was heated for one hour at 500 deg. C., and the resistances were taken at intervals during the subsequent cooling.

All of the results are plotted in the chart. Curves 1, 2, 3 and 4 show the insulator conductance in mhos which will just suffice to completely prevent sparking by a magneto or an induction coil under 60 and 90 lb. air pressure respectively. The other sets of curves, A to M, show the conductances of the insulators of the spark plugs at different temperatures. In this connection it may be pointed out that the conductance in mhos is the reciprocal of the resistance in ohms. All of the insulators were of porcelain, with the exception of K, L and M, which were of mica. It will be seen that the limiting conductance increases with the number of sparks produced per minute. This latter basis of comparison was chosen by Mr. Morgan, rather than speed of rotation, because his battery set was a six-cylinder set and his magneto a four-cylinder machine.

From the diagram it will be seen that with insulators A, B, C and D, the conductance at 340 deg. C. (644 deg. Fahr.) has increased so much that when working with battery ignition under 60 lb. compression, ignition fails. With a magneto under conditions corresponding to line 2 (60 lb. compression) sparking would cease at 500 deg. C. In the case of plugs H to M, temperatures up to 500 deg. C. would have no effect on the ignition with either the coil or the magneto.

In interpreting the results of these tests it is necessary to bear in mind that the spark voltages, while of the order used in the testing of spark generators, are undoubtedly higher



The temperature scale is to be used in connection with the lettered curves and the "sparks per minute" scale with the numbered curves

than those used in engine practice. There the spark voltage is usually of the order from 5000 to 6000. The difference between these figures and those of the tests may be accounted for by the higher temperature of the gases. In the tests the temperature in the compressed air chamber was that of the atmosphere.

The net result of the investigation is that insulation leakage due solely to temperature is not so serious a matter as curves showing the resistance variation with temperature seem to indicate.

—

Left-Side Drive for Export Cars

(*Continued from page* 19)

result from changing the design of the whole product. The additional expense must, of course, be borne by the export trade. It only remains for us to get together and show our foreign customers that we can build cars for them both better and cheaper as we build them for home consumption than we can with special export features. Once the novelty of the left drive has worn off they will not object to it any more than our domestic customers do now.

A few years ago the members of the National Automobile Chamber of Commerce got together on the elimination of sixty-inch tread for Southern roads. Why should they not now agree upon the elimination of this greater nuisance of both left and right drive models?

The Passing of National Shows

EVER since it became customary to hold automobile shows in all of the more important cities there has been a certain anomaly in the show situation. With the exception of two of these shows—at New York and Chicago—they were held by local dealers' organizations. The dealers of Detroit, Cleveland, Buffalo, etc., each year held their show, but the dealers of New York and Chicago were deprived of this privilege. In these cities the shows were held under the auspices of the automobile manufacterers' association. They were called national shows, while the shows in the other cities were designated local shows. Yet the character of all of these shows was not materially different. In the early years New York and Chicago undoubtedly had a great lead in the number of exhibits, but this gradually vanished, and of late several of the local shows, including those held at Boston and Minneapolis, have outstripped the former leaders in this respect.

The situation in the show field is the natural result of historical development. When automobile manufacturers first decided to promote their business by holding shows they settled upon New York and Chicago as the cities where this could be done most effectively. Local promoters soon made efforts to get them to exhibit in other cities also, but the manufacturers felt that two shows each year were all they would want to patronize, and so resolutions were passed which prevented manufacturers from taking part in other shows.

Later, when the system of selling automobiles through local agencies became well established and agencies in the larger cities had become quite numerous, these agents saw in the show a means of stimulating automobile interest locally. Local dealers' organizations were formed and shows put on, first in the more important cities, such as Boston, Philadelphia, Kansas City, etc., and later also in smaller places. A regular show circuit was soon arranged, with dates set so that exhibits could be conveniently moved from one show to the next. Thus, of the local shows the Philadelphia show was generally the first, coming immediately after New York.

There are two things that made the New York show stand out among others. The first was that it was generally the first of the season, at which new models of cars and new accessories and parts were first exhibited to the public, so that there was much more novelty attached to this than to the other shows. The other point in which the New York show was ahead was that it was held in the greatest purchasing center of the country. This held especially in the earlier period before the automobile had become a necessity on the farm. Of late years, however, the demand for automobiles has spread much more evenly throughout the country. While for a great many years New York State held the leadership in respect to number of cars owned in proportion to population, this lead has now passed to Iowa.

Although the New York show, even up to last year, undoubtedly drew visitors from more States than any of the so-called local shows, it was in no sense a truly national show. In the early years it was to quite an extent a trade show, held for the purpose of securing agents in the Eastern territory. However, as agency connections became more permanent, changes in models less radical, and the dates of the show and the beginning of the business year of most firms more widely separated, this feature lost much of its one-time importance. The show has always had the character of a great public entertainment, with decorations sometimes rather extravagant, concerts, and a general holiday air. There have been spasmodic attempts on the part of individual manufacturers to put a stop to the show, but everybody always felt that as long as the show was held he could not afford to be absent. The momentum acquired in a decade and a half kept the thing a-going in the old channels, and it required the disruptive influence of a world war to bring about a change for which many manufacturers had been yearning for years.

Hereafter, New York and Chicago will have the same sort of show as in previous years, with just as

many car models and probably as many accessories on exhibition as formerly. But the shows will be in charge of the local dealers who control the sales in this territory. One advantage to be expected from the new arrangement is that there will be less interference with production at show time, which usually coincides with the busiest period of the year in the factories.

France as a Future Competitor

PREVIOUS to the war France was the largest automobile exporter in the world, her exports in 1913 having amounted to 24,167 tons, which may be taken to represent about that number of chassis. Even then, however, the United States, owing to the low prices at which it furnished reliable vehicles, had become a formidable competitor. The outbreak of hostilities entirely stopped French exports, while in the case of the United States, after a slight flurry due to disorganization of transport and financial services, it had the effect of greatly stimulating the export of both passenger cars and trucks, until the record set by France was greatly exceeded. With the entrance of this country into the war and the restrictions placed upon the production of both passenger cars and trucks, our exports of cars have dwindled away, and as by Jan. 1 next all our manufacturers would have been on a 100 per cent war work basis, our foreign automobile trade by this time would have reached about the same low level as that of France, had not the war come to a timely end.

In the future France will undoubtedly be our most formidable competitor in foreign markets. Like every other industrial country, she is dependent upon the export of manufactured goods in order to maintain a favorable trade balance. Until now a very important item in her exports to the United States has been that of wines and liquors, and it now looks as though this business might be permanently stopped. The resulting decline in exports would be an incentive to France to force export business in other lines, particularly automobiles.

It must be remembered that the French automobile industry is well organized. There are numerous firms engaged in this line and French designers are admittedly very talented. In production methods France has been somewhat behind other countries, and this prevented her from selling cars on a strictly competitive basis, but it is quite conceivable that the war, together with the extensive importation of American machine tools, has wrought a change in this respect. Moreover, France now has possession of the minette iron ore deposits in Lorraine which will greatly add to her iron production and no doubt give a great impetus to all branches of her mechanical manufacturing industry.

That French manufacturers are alive to the situation that will confront them now that free competition for the world's automobile market has begun once more, is evidenced by the publication of a book on "The Automobile After the War," by Georges Cote, a well-known manufacturer. Mr. Cote seems to have discovered much that is good in American methods both of production and distribution, and he advocates the adoption of similar methods by his fellow-manufacturers. It is quite refreshing to see a French manufacturer recognize the merits of American automobiles. Previous to the war they sought to belittle our cars by the use of such artful phrases as "absolutely lacking in grace of lines," or "thrown together like coffee grinders," but the numerous cars of American construction which found their way to France during the war have evidently given a good account of themselves and convinced Frenchmen that although our machines may not conform to their ideas of attractiveness they are nevertheless most serviceable.

Our Available Petroleum Resources

IT is not necessary to note statistics in order to convince a thinking person that the consumption of petroleum is increasing at an enormous rate and that in a not very remote age there must appear signs of exhaustion of our oil fields. Drilling for petroleum in the United States began only in 1859, and for the first two decades the production was insignificant as compared with the amount now taken from the wells each year. In 1900, when the automobile was first put on a production basis, the mining of petroleum received a great impetus, the census of production showing a very sharp deviation from its previous direction at this point. From 1900 to 1910 the production substantially quadrupled and since then there has been a further increase of about 60 per cent.

So far what has worried the internal combustion engine interests mainly has been that the increase in the demand for the light fractions, which are most suitable for use in small, high-speed engines, has been much more rapid than that of the other fractions, with the result that the prices of the lighter fractions have gone up very much more than those of the others. During the past year, however, in consequence of the unprecedented industrial activity, there was a decided shortage of fuel oil. While this was in no way due to there being insufficient oil in the ground to meet the requirements still it draws attention to the fact that the increased consumption of petroleum is not solely due to the rapidly increasing use of internal combustion engines in automobiles, motor boats, tractors, airplanes, etc., but that industrial uses also called for increased supplies.

In a report presented to Congress in 1916 on the productive possibility of all known pools in operation and estimates of undeveloped areas, the petroleum reserve of the United States per capita based on a population of 100,000,000 is given as about 70 barrels. The meaning of this figure can be gaged when it is stated that in 1917 alone the production was 3.4 barrels per capita and during the period 1859-1917 the aggregate production was 42 barrels. These figures are most portentous.

Latest News of the

Want Prompt Action on Dent Bill

Measure Validating "Illegal" Contracts Urgently Needed to Help Transmission

WASHINGTON, Dec. 28—Prompt action by Congress on the bill authorizing the Treasury to pay on contracts which were not "legally" executed was impressed upon the House Committee on Rules to-day by Secretary of War Baker and his assistant secretaries, Crowell and Stettinius.

The bill, which was published last week in AUTOMOTIVE INDUSTRIES, provides for the payment of all just contracts which were made by telegraph, telephone, letter or verbal agreement and which the Controller of the Treasury has refused to recognize.

The House Committee voted to report a special rule January 2 providing for immediate consideration of the bill. Secretary Baker pointed out the need of prompt action to enable the Government to meet its honest obligations and deal equitably with business firms that have gone ahead with hurry-up work for the war emergency.

He said that large sums of money are at present tied up, making undue hardships and threatening serious consequences if action is not taken. Assistant Secretary Crowell stated that more than $1,675,900 is involved in contracts which were not legally executed with manufacturers in the United States.

Inability of these concerns to resume work because of lack of funds is already apparent, he said, by increasing unemployment following the return of discharged soldiers. "These contractors have their working capital tied up," Mr. Crowell explained, "and resumption of their business cannot proceed. A few of these industries have gone to work." The War Department has received telegrams from many saying that bankruptcy proceedings would result in a week or two unless they got a settlement. Banks also are looking skeptically at these contracts.

The most serious objection to the bill drawn up by Congressman Dent and which will be considered Thursday is that it eliminates all profits, even the 10 per cent profit which was to be allowed. This feature, it is expected, however, will be overcome by an amendment offered when the bill is on the floor. Many of the contracts which were not legally executed are with manufacturers in Great Britain, France and Italy and these countries, in settlement of contracts, always recognize that the contractor is entitled to a profit and for this reason alone it will be necessary to allow for the payment of some margin of profit.

No More Supplies to Air Service

WASHINGTON, Dec. 30—No aviation supplies of any kind are being shipped to the American Expeditionary Forces and none will be. The air forces abroad are being demobilized as rapidly as possible. This information was made public here to-day by General Peyton C. March, when he stated that "the air forces are being demobilized with the greatest rapidity."

Reeves Leaves Washington

WASHINGTON, Dec. 30—Albert Reeves, General Manager of the National Automobile Chamber of Commerce, who has been in Washington for some time conducting the office here, will return permanently to New York City Jan. 3. The Washington office will be continued indefinitely and will be conducted by Harry Perry.

Gerstner Field Destroyed

WASHINGTON, Dec. 30—Gerstner Flying Field, Louisiana which was destroyed by a hurricane Aug. 6, will be reconstructed. The cost will probably amount to $130,000.

Ford Makes Basic Rate $6 a Day

DETROIT, Jan. 2—The Ford Motor Co. which in 1914 established a basic daily rate of pay for its employees of $5, has raised this to $6 effective with the opening of the new year. The increase affects 28,000 men employed in both the passenger car and tractor factories as well as Ford employees in the various assemblying plants throughout the country. The resignation of Henry Ford as head of the Ford Motor Co. is confirmed and his son Edsal has been formally elected president of the company at a salary of $150,000 a year. Henry Ford is to devote his time to his tractor interests and to the publication of a newspaper, as previously made public. B. G. Craig, assistant treasurer for the Ford company, has been elected secretary and Ernest G. Liebold, personal secretary to Henry Ford, will follow him to Dearborn to assume an executive position with the tractor company.

Baker Sales Manager of Kelly-Springfield

SPRINGFIELD, O., Jan. 2—John Baker, Jr., has been appointed general sales manager of the Kelly-Springfield Motor Truck Co.

Military Aeronautics on Peace Basis

Colonel Edgar Heads Organization Board—Half of Personnel Wants Release

WASHINGTON, Dec. 30—A peace time organization for the Department of Military Aeronautics has been arranged under Major General William L. Kenly as follows:

BOARD OF ORGANIZATION

Colonel C. G. Edgar, Colonel F. R. Kenney, Colonel A. Woods, Major E. Hubert Litchfield, Recorder.

Operating under this Board are the following sub-boards:

DEMOBILIZATION

Lt. Colonel George B. Hunter, Chairman, Lt. Colonel Rush B. Lincoln, Major Walter George Rogers.

OPERATIONS IN PEACE TIMES

Colonel William E. Gillmore, Chairman, Colonel Gerald C. Brant, Lt. Colonel Thomas Duncan, Lt. Colonel Barton K. Yount, Lt. Colonel Ira Longanecker, Lt. Colonel Benjamin F. Castle, Captain John W. Davis.

MUSTERING OUT

Major E. Hubert Litchfield, Chairman, Lt. J. J. O'Brien.

COMMITTEE ON TRAINING

Colonel Milton F. Davis, Chairman, Lt. Colonel John Armstrong Drexel, Lt. Colonel Seth W. Cook, Major William A. Robertson, Professor Edward L. Thorndike.

INVENTION AND RESEARCH

Captain Adelbert Ames, Jr., Chairman, Captain Robert R. McMath, Professor Wallace C. Sabine.

SUPPLY

Lt. Colonel Thomas G. Gallagher, Chairman, Lt. Colonel Harold Bennington, Major C. S. Benton, Major Walter G. Rogers, Major Eugene E. Deacon, Major Harold R. Eyrich, Capt. David R. Wheeler.

The officer in charge of demobilization announced recently that reports from all Air Service activities show the following preference on the part of the personnel, both commissioned and enlisted: One-eighth request complete separation from the service. Three-eighths request to enter the Regular Army. One-half request to enter the Reserve Corps.

Detroit Field Named "Morrow"

WASHINGTON, Dec. 30—The Air Service Acceptance Park at Detroit will be known officially as Morrow Field in honor of Lt. Karl Clifton Morrow, aviator, who lost his life Nov. 11.

Automotive Industries

48 Get Show Space in New York

Dealers Draw for Places in Garden—62 Car and 27 Truck Men Get Chicago Space

NEW YORK, Dec. 28—Drawings for the New York and Chicago shows have been held by the dealers in those cities, and plans for the biggest and best shows ever are going forward in a gratifying manner.

The space has been nearly all disposed of and it looks now as though there would be a considerable number of applicants who won't be able to get in at all.

Reports being received by Manager Charles A. Stewart of the New York show indicate that the manufacturers will visit the big city as in former years, and that there will be the usual big influx of dealers from everywhere.

The Hotel Astor, just before the show dates were selected, urgently telephoned the dealers' association and asked for the show dates in order that a big pile of room reservations might be taken care of. When Stewart asked the Prince George Hotel, opposite the Garden, for a room for the use of the show committee, he was informed that the hotel was booked solid for the whole show period.

With the coming of peace and the resumption of production the indications are that the show crowds will be bigger than ever. Visitors are requested by the show committee to make their hotel reservations at once in order to be sure of a place to sleep.

The dates of the show are Feb. 1-15. The Chicago show is Jan. 25-Feb. 6. In each case the first week will be devoted to passenger cars and the second week to trucks.

Monday noon of this week the New York show committee and the New York newspaper men met at lunch at the Astor and laid plans for promoting the show and making it the best ever held. Newspaper men stated that this year they had begun their promotion work several weeks earlier than usual and that they were going to stay behind the project and boost it in all their travels throughout the manufacturing zones.

Manager Stewart stated that season tickets were to be sent to all the dealers within 700 miles of New York, and that any other dealers who came from anywhere would be given a cordial reception by the New York Automobile Dealers' Association and a season pass.

The annual meeting of the National Automobile Dealers' Association will be held during the Chicago show, and a big dealer mass meeting is being planned for Wednesday noon of the New York show. This will be addressed probably by President F. W. A. Vesper and some other speakers of national prominence.

The decorative schemes for both shows are, it is said, to be unusually attractive.

(*Continued on page* 40)

Canada May Cut War Tax

OTTAWA, Dec. 30—Announcement may be made shortly of the removal or modification of the war tax on automobiles. Representatives of the organized automobile industries of Canada waited on Sir Thomas White, acting Prime Minister, and Hon. A. K. MacLean, acting Minister of Trade and Commerce, and urged that the excise war tax on automobiles be removed. The tax which was imposed in the last budget amounts to 10 per cent on automobiles, and is applicable to all imported into or manufactured in Canada and unsold on April 30, 1918. The request of the automobile manufacturers is being considered at Ottawa.

Bruske Leaves Harroun

DETROIT, Dec. 30—Paul Hale Bruske, after spending 2 years as advertising director for the Harroun Motors Corp., Wayne, Mich., has returned to the Power, Alexander & Jenkins Co., advertising agents. He will continue to supervise Harroun advertising. He will also have the supervision of the advertising campaigns of a number of Detroit manufacturers.

S. A. E. Membership Increases

NEW YORK, Dec. 31—Membership in the Society of Automotive Engineers increased 717 during the year just closed. On Dec. 1, 1918, there were 3780 members, including affiliate membership representatives and enrolled students but not Section associates, as compared with 3063 on Dec. 1, 1917. During the year nearly 900 applications for membership were received as compared with 1400 during 1917. The percentage of applicants who qualified, however, increased from 72 per cent in 1917 to 84 per cent in 1918.

At the meeting of the council of the society, held Dec. 11, 313 applicants were approved for various grades of membership and one for student enrollment.

The following members were appointed to Standards Committee Divisions: Berne Nadall (Miscellaneous), Lieut.-Col. V. E. Clark (Aeronautic), Wayne H. Worthington (Tractor). President Kettering was appointed to represent the society on the Advisory Committee of the Engineering Division of the National Research Council.

Automotive Stock Transactions

Price Tendencies Have Been Almost Uniformly Upward During 1918

NEW YORK, Jan. 2—Transactions in automotive stocks on the New York Exchange during the past year show that the general tendency in price has been upward. Reference to the analysis on page 33 shows that as a rule automotive stocks touched their lowest points during the early months of 1918 and their highest during the fall. The last transaction of the year in each listed stock represents a price which is much nearer the highest than the lowest. Taking the list as a whole, a very healthy condition is indicated.

(*Continued on page* 33)

Steering Wheels From Mansfield

MANSFIELD, O., Jan. 2—The Allerding Products Co. has been formed here and is to specialize in the production of steering wheels and wood rims for aircraft and other purposes. The company has a capital stock of $50,000, the directors being: C. N. Allerding, E. S. Walter and John H. Coss, of Mansfield; Charles S. Munson, Detroit; James Israel, Mt. Vernon, N. Y.; Fred R. Jones, Cleveland, and C. F. Allerding, Mt. Vernon. C. N. Allerding heads the company; other officers being: vice-president, Charles S. Munson; secretary-treasurer, E. S. Walter.

Post Office Returns Airplanes

WASHINGTON, Dec. 31—The Post Office Department has turned back to the War Department 100 DeHaviland 4 airplanes, which, it is said, have proven utterly unfit for cross country mail flying. This action followed extensive flight and service tests between New York and Chicago and Washington and New York, which, it is said, showed the planes to be unadaptable for the heavy postal work. Postal officials stated here that a number of the planes crumpled in making landings and taking off for flights and several accidents, including one fatality, resulted. These planes were turned over to the Post Office by the War Department under the recent act of Congress.

The War Department has also furnished the Post Office 12 two-engined Handley-Page planes which will shortly be assembled and put on the New York-Chicago mail route. Until these planes are assembled the New York-Chicago mail service will be postponed.

Aircraft Exhibition Assured

To Be Staged Feb. 27-Mar. 6 in Madison Square Garden —Dinner on Jan. 7

NEW YORK, Dec. 30—There will be an aircraft exposition in New York Feb. 27 to March 6, both dates inclusive. The Aircraft Manufacturers Association has obtained an option on Madison Square Garden for that week, and though definite plans for the show have not been completed, it is stated that sufficient exhibitors are assured to make the event the most complete of its kind ever held.

Plans for the show are to be made public at a dinner to be held by the Aircraft Manufacturers Association at the Waldorf on Tuesday, Jan. 7. It is expected that probably 500 persons will attend, including as guests of honor representatives of the military, legislative and executive branches of the Federal Government. Arrangements for the dinner are in the hands of J. G. White, of the J. G. White Engineering Co.

It is planned to make the exhibit truly international in character. It will include exhibits of various American and Allied military airplanes as well as exhibits of engines and accessories.

The show has been made possible by the revocation of the Presidential proclamation forbidding aircraft exhibitions as inimical to the best interests of the country during the course of the war. This proclamation was issued on Jan. 1 of this year. Recently the Aircraft Manufacturers Association took up with Washington the matter of holding a show now that the war has ended. The War Department apparently was willing to extend its co-operation but could do nothing in view of the President's proclamation.

The matter was then presented to the Judge Advocate General, with the result that the whole matter was cabled to France. In the meantime the State Department had prepared a new order rescinding the former one and this, in turn, was cabled abroad for the President's approval. In consequence, the following statement has been made public by Washington:

"At the request of the Secretary of War, the President has authorized the issuance of a proclamation revoking the proclamation of last January prohibiting the exhibition of aircraft during the war. Pending the formal signing of the new proclamation, the Secretary of State has requested the Attorney-General not to prosecute any infringement of the earlier proclamation."

Packard Develops National Service Bureau

NEW YORK, Dec. 30—The Packard Motor Car Co. of New York has formed an organization to serve particularly the transportation requirements of companies doing a national business. A. C. Harrington, for the past year vice-president of distribution for the New York company, will have charge of the new organization, and associated with him are F. H. Pietsch, manager of truck distribution for the Packard Motor Car Co. of Chicago, and James T. Adams, until recently manager of the Washington office of the company.

Better Facilities for Tractor Show

KANSAS CITY, Dec. 30—Erection of the temporary building on the Union Station Plaza, where the Fourth National Tractor Show will be held Feb. 23-March 1, has begun. Steam pipes are being laid from the heating plant in the Union Station. A feature of the building at this show will be the suites of rooms for the use of exhibitors who plan meetings of salesmen, distributers and prospective dealers. Rest rooms, nursery and playrooms will be provided—eliminating one of the hindrances of previous shows, the children who have to be taken with parents looking at tractors. Inquiries and announcements indicate that many foreign governments will send representatives to the Kansas City show, where the tractors can be seen, and where touch can be effected with people from the districts using tractors most largely. Among the visitors announced are the Russian mission, the Italian delegation of agricultural engineers, a technical expert from the British minister of agriculture, a commissioner of the French government, commissions from South American countries, and representatives of foreign distributers of American equipment.

Not All Plugs Certified

WASHINGTON, Dec. 30—The Federal Trade Commission to-day ordered the Silvex Co., Hellertown, Pa., to discontinue representations that its "Bethlehem aviation" spark plug has been "certified by the United States Bureau of Standards." The commission found that while large numbers of Silvex plugs had been furnished the Government and had been subjected to the usual Bureau of Standards tests, the Bethlehem aviation plug had not been "certified" by the bureau, as represented in a circular letter sent out by the company. The commission's order was issued by agreement with the company, which waived right to introduce testimony in support of the act.

Now It's Captain Rickenbacker

PARIS, Dec. 6—Ex-race driver Eddie Rickenbacker is now captain and squadron commander in the American Air Service. Soon after the signing of the armistice Captain Rickenbacker was given orders to prepare to move his squadron forward into German territory. This move was made a few days ago, and Captain Rickenbacker is now flying from a German aerodrome. Before actual fighting stopped he had attained the position of Ace of Aces in the American Army.

First Post-War Car Exhibit

Will Be Lyons, France, Sample Fair—Number of American and Foreign Entries

PARIS, Dec. 4—The first post-war automobile show in Europe will be a portion of the Lyons Sample Fair to be opened in the Silk City on March 1, 1919. In order to take care of automobile manufacturers a special building has been erected in the fair grounds for automobiles only, and the participation of automobile manufacturers is being encouraged by the French manufacturers' associations.

The list of exhibitors which has already been gotten together shows that this automobile section will be of considerable importance. American firms are Goodrich and Overland. European automobile manufacturers who will have cars on exhibit comprise the following: Berliet, Blum, La Buire, Chiribibi, Cottin & Desgouttes, Delage, Delahaye, D. F. P., F. I. A. T., Hotchkiss, Panhard-Levassor, Rochet-Schneider, Th. Schneider, Turcat-Mery, Unic, Lorraine-Dietrich, De Dion Bouton, Peugeot, Rolland-Pilain, Vinot & Deguingand. In addition a large number of tire and accessory firms have booked space, among them being Bergougnan, Nilmelior Magneto Co., S. E. V. Magneto Co., Zenith Carbureter Co., Dunlop Tire Co., Lavalette Magneto Co. and Oleo Spark Plug Co.

In 1918 there were 3182 exhibitors at the Lyons Fair, and the amount of business transacted was $150,000,000. The 1919 fair will undoubtedly be the biggest ever held, for on Nov. 1 of this year 2103 firms had secured space, compared with only 978 twelve months previous. The exhibition is open to all allied and neutral nations, and space can be reserved until the last day of December.

Wisconsin Good Tractor Market

MILWAUKEE, Dec. 30 — Wisconsin will furnish the tractor industry with an exceptionally fertile market during 1919, according to manufacturers and dealers who have given thought and studied figures issued by the State Department of Agriculture that in 1918 a total of 8,784,761 acres of crops were raised in this state, compared with 8,689,354 acres in 1917 and 7,915,904 in 1910, federal census year. While the increase since 1910 is considered a good one, it is felt that with more favorable means of prosecuting farm work such as the farm tractor provides a much larger acreage would have been yielded.

It is estimated that Wisconsin absorbed from 1200 to 1500 tractors during 1918. This made it possible to increase the crop acreage over 1917 by 95,407 acres despite the fact that approximately 50,000 Wisconsin farmer boys were called to the colors within the period.

At this time it is figured that 3000

Wisconsin farmers own tractors. In view of the fact that this state contains more than 80,000 farms of more than 100 acres each, the ratio is regarded as low and indicative of the large number of farms now without power machines which tractor dealers have available as potential tractor purchasers.

Dort Men Get $40,000

FLINT, Dec. 30—Three hundred or more men and women sat down to a Christmas dinner in Flint. The occasion of this dinner was not only to meet and eat and exchange greetings, but to distribute $40,000 among 111 employees of the Durant-Dort Carriage Co. The recipients of bonuses were men and women who had worked continuously in the company's service for six years or more, and the size of the checks passed out ranged from $60 up to more than $2,500.

The plan under which the distribution was made is known as the "Loyalty and Merit" plan and was originated and executed by J. D. Dort, now president of the Dort Motor Car Co.

Philadelphia-Atlantic City Passenger Airplane Route

PHILADELPHIA, Dec. 28—An airplane route to Atlantic City is planned, the cost of transportation to passengers to be $50 one way, but if a passenger decides to make a round trip $25 will be deducted on the return. Construction of a hangar and factory with a 25-ft. beach front has been started near the inlet. It is expected that the company will begin carrying passengers soon after Easter.

Commercial Plane Service Planned

CHARLOTTETOWN, P. E. I., Dec. 30—At a meeting of business men of this city yesterday it was resolved that a company be formed to be known as the Prince Edward Island Aerial Transportation Co., capitalized at $25,000. A committee of five was appointed to solicit subscriptions and organize if the necessary financial support was forthcoming. The initial route proposed is Moncton, Summerside, Charlottetown, Georgetown, Pictou, New Glasgow and Halifax, with a double daily service summer and winter. Mails and express are to be handled first and later passengers. The proposition was submitted to the meeting by Major Kennedy, of the Royal Air Service, expert of the Aircraft Company, with headquarters in London.

Norway Good Car Market

WASHINGTON, Dec. 30—Bergen, Norway is reported by Consular R. C. Busser, as an excellent market for passenger cars and motor trucks, for which it is said there is a great demand. Bergen merchants and inhabitants generally have enjoyed prosperous business although in some lines operations have ceased because of lack of raw materials.

Fuel Important at S. A. E. Meeting

Subject Will Have Prominent Place—Program Rapidly Being Completed

NEW YORK, Dec. 30—The program for the winter meeting of the Society of Automotive Engineers to be held in the Engineering Societies Building, New York, Feb. 4-6, is rapidly rounding into shape. Among other engineering discussions considerable time will be devoted to the fuel situation, and it is stated that an authoritative statement regarding the new "Liberty" fuel will be made.

The fuel discussion will be led by President C. F. Kettering, who will summarize the situation to date with particular reference to the need for improving the thermal efficiency of engines. In addition, there will be an analysis of the supply of petroleum in the United States by a representative of the United States Geological Survey and a discussion of modern refinery practice. Dr. Joseph E. Pogue, of the Bureau of Oil Conservation of the Bureau of Mines, will present an interpretation of the fuel situation.

It is expected that that portion of the sessions devoted to aircraft matters will be of prime importance. J. G. Vincent, formerly lieutenant-colonel and chief of the airplane engineering division of the Bureau of Aircraft Production, will deliver a paper on engines of the fixed type with radially arranged cylinders. He will also give a lot of information on the Liberty engine in addition to what has already become public. A paper on proportioning planes to their engines is in course of preparation.

Henry M. Crane, vice-president and chief engineer of the Wright-Martin Aircraft Corp., will address the gathering on the effect of aeronautic experience on automobile design and construction.

Major Arthur B. Brown is scheduled to present a paper on Better Truck Performance. The future development of lighter and more efficient passenger cars will be discussed by A. Ludlow Clayden, consulting engineer of the Wright-Martin Aircraft Corp. D. McCall White will talk on light, efficient automobile engines.

It is planned to cover tractor engineering in a comprehensive manner, and it is expected that a number of hitherto hidden matters with regard to the development of war automotive apparatus may be revealed.

Imports and Exports Modified

WASHINGTON, Dec. 26—Several additional modifications have been announced by the War Trade Board regarding tin, copper ore, shellac and shipments to the United Kingdom.

All restrictions on the export of tin and tin plate have been removed. The limitations on the import of mahogany, shellac, other lacs and on varnish gums have been lifted.

Applications for the import of copper ore will now be considered where the shipment originates and comes from Korea, Newfoundland, West Indies, France, England, West Coast of South America, Cuba, Canada or Mexico, irrespective of the content of copper. Shipments will be allowed from Spain when containing more than 2 per cent of copper. Copper concentrates will be allowed for import from Cuba, Canada or Mexico irrespective of content and of copper concentrates from any non-enemy country other than these only when containing 50 per cent or over of copper. All restrictions on the import of copper matte or blister copper are removed.

Individual licenses for shipments to the United Kingdom will no longer be referred to the British War Mission in view of the elimination of the permit-to-purchase system by the Controller of Import Restrictions, London Board of Trade, which means that permits to purchase in England for import are no longer required.

Articles which are prohibited import, however, must be covered by an import license which can only be obtained by the consignee. Exporters are therefore advised before making shipment to obtain an import license from the consignee or learn definitely from the British Import Restrictions, Agricultural Machinery Department, or other department interested, that an import license is not necessary. Where the British permit to purchase has been issued it remains valid.

Canada Wants Standard Gas Price

TORONTO, Dec. 30—A standard price for gasoline all over Canada is aimed at by the Retail Automobile, Garage and Accessory Dealers' Association. Acting through the Retail Merchants' Association they are taking up the matter with the producing companies. At a meeting held the past week in Toronto it was reported that the firms that had been interviewed so far by the committee had reported favorably upon the proposal. The Ontario dealers are behind the move, and it is stated that the Western dealers are lending active co-operation and that dealers in all the Provinces want the standard price adopted.

Good Business for Boston

BOSTON, Dec. 28—The uncertainty and indecision which hovered about the motor district in Boston among people about to buy cars who were holding off because they expected to see prices drop is disappearing. During the past few days the inquiries and callers have again become normal and sales are being booked for future delivery.

New York Office for Twin City

NEW YORK, Dec. 30—The Minneapolis Steel & Iron Co. has opened a New York office in the Tribune Building, 154 Nassau Street.

M. T. C. Shipped 110,911 Vehicles To A. E. F.

WASHINGTON, Dec. 31—The Motor Transport Corps of the United States Army shipped 110,911 vehicles, including motor trucks, passenger cars, ambulances, motorcycles, bicycles and side cars, to the American Expeditionary Forces from the beginning of the war to Dec. 1, 1918.

Of this number 1196 vehicles were lost by sinkings at sea.

During the same period 15,468 tons of spare parts were shipped, of which none were lost. These figures are contained in a report just completed by the Motor Transport Corps.

On pages 32 and 33 is the complete report.

Capt. Finkenstadt Returns to Peace Duties

WASHINGTON, Dec. 30—Capt. E. R. Finkenstadt, Assistant Chief of the Truck Section, Motor Vehicles Division, Quartermaster Department, who was formerly assistant to Christian Girl, president of the Standards Parts Co., will complete his work here by Jan. 10 and at that time return to the Standard Parts Co. Capt. Finkenstadt was for many months Chief of the production of the B standardized truck, officially known as the Liberty truck.

Combination Under Webb Bill

WASHINGTON, Dec. 31—That American manufacturers are commencing to take advantage of the Webb bill is evidenced by reports from the Federal Trade Commission. One of the first to cooperate for export trade is the office equipment industry. The Globe Wernicke Co., The B. L. Marble Chair Co., and the Commercial Furniture Co. have arranged a combination and filed a statement with the Federal Trade Commission. The statement shows that the concerns will appoint a joint representative to manage their association which will be known as the United States Office Equipment Export Association. Necessary funds for the enterprise have been contributed, with the Globe Wernicke company investing $10,000, the Marble company $5,000 and the Commercial company $5,000.

All foreign business of the three concerns excepting Canadian will pass through the association. The costs will be prorated among the three on the basis of volume of sales of each party through the association. Bad debts will be treated as joint expense.

British Post-War Cars Exhibit Radical Ideas

LONDON, Nov. 1—By mail—Although British manufacturers of motor cars are still far removed from quantity production of motor cars, the trend toward post-war models is becoming more marked every day, and already some details of cars which before the war would have been considered nothing if not radical have been permitted to become public.

It is expected that aeronautic experience will have a profound effect on design and that lighter, more efficient cars will be the result. For example, it is stated that one manufacturer of international repute has designed a car fitted with a five-cylinder air-cooled radial engine and having a chassis which has many other departures from orthodox practice. The cylinders are set star-fashion around the crankcase. Another maker proposes to use a tubular frame carried on transverse semi-elliptic springs front and rear.

Eagles Proved Fit for Navy

WASHINGTON, Dec. 28—Trials of Eagle boats have convinced Navy constructors that the little craft turned out by the Ford plant at Detroit to fight submarines are worthy of taking their place as permanent units of the fleet. It was learned yesterday that official reports to the Navy Department giving full details of the trials show that in speed, seaworthiness and maneuvering ability the new boats exceed all contract requirements.

An average sustained speed of 18.3 knots was made by the boat used in the tests. The vessel showed no signs of "buckling" when the speed was forced still higher for short periods.

Three Eagles recently sent through the Welland Canal into the Atlantic arrived at their destination on the coast after passing through two gales of unusual severity. The crews reported the boats had been more comfortable than certain types of destroyers and the hulls had not strained at any point. Most of the Eagles completed under the war contract will be utilized as gunboats.

Commerce Guarantees Prices

DETROIT, Dec. 30—To eliminate the uncertainty of the price question, the Commerce Motor Truck Co. has guaranteed distributers against any reduction in the price of Commerce trucks that may be on order, in transit or on the floor of the distributer should a reduction in list price be made.

Capital Issues Committee Inactive

WASHINGTON, Dec. 28—The Capital Issues Committee of the U. S. Treasury Department, which has controlled the sale of stock and bond issues during the war, will discontinue active work beginning Dec. 31, 1918, and will remain as an inactive body to be called back to service if the need arises in the future. This committee has passed upon all stocks and bond issues planned during the war, deciding whether or not these were compatible with the national interests during the emergency. Its retirement at the end of the year means that with the new year the Government removes all restrictions on capital increases or the flotation of new companies, and so forth. The committee in announcing its inactive part in the future mentions the existence of numerous fraudulent plans for stock and bond sales and warns against them, asking for some special legislation to examine into and supervise all future capital issues.

Foreign Drivers for 500-Mile Race

PARIS, Dec. 30—Special Cable—Already interest is awakening in the promised revivals of the 500-mile race on the Indianapolis Speedway which has been set for May 31. It is stated that probably four, and perhaps more, foreign drivers will start. Those who have indicated a desire to participate are Louis Wagner and Jack Scales, who probably will drive Fiats; Chassagne and Christianes, who likely will hold the wheels of British Sunbeam cars.

All Garages Can Handle Ford Parts

DETROIT, Dec. 26—After Jan. 1 any garage can handle Ford parts and secure the regular dealers' discount on them. The Ford Motor Co. has been trying this method out in a limited way and has found it successful and intends to make it a plan of national scope starting on Jan. 1. This will not only increase the distribution of the Ford parts but will also in a broad way militate against the large number of so-called fake parts.

This is only another step in the Ford policy to broaden the sales policy to such a degree as to make the car and its parts almost a matter of general merchandising. The removal of territorial restrictions on Ford sales last year was the first step in this direction. There is no restriction on the part of the garageman regarding the number of parts nor the amount of money he need expend in laying in a stock.

Contracts Placed

WASHINGTON, Dec. 28—Following is a list of contracts placed by the Motor Vehicle Division, Quartermaster Department, on Dec. 17, 1918:

Trailmobile Co., Cincinnati, 1000 cargo trailers, $596,000.
Goodyear Tire & Rubber Co., Washington, 5750 casings, 600 tubes, $230,720.
Kelly-Springfield Tire Co., Cleveland, 2000 tires, $80,680.
Fisk Rubber Co., Washington, D. C., 3765 casings, $57,003.50.
Firestone Tire & Rubber Co., Akron, 1965 casings, 5875 tubings, $76,874.25.
United States Tire Co., New York City, casings and tubes, $388,112.50.
Pennsylvania Rubber Co., Jeannette, Pa., 3000 casings, $31,500.

Briscoe Price to Stand

NEW YORK, Dec. 30—The Briscoe Motor Car Co. has made public the fact that there will be no changes in the price of Briscoe cars before July 1, 1919.

Packard Prefers Returned Soldiers for New Workers

DETROIT, Dec. 28—The Packard Motor Car Co. will give preference to the returned soldier's application for re-employment, in recognition of his service and his sacrifice. Since the declaration of war considerably more than 3000 Packard employees have left the factory to serve in the Army, Navy or in other departments of the Government. Some already released have applied for re-employment, and it is the company's wish to treat them all with a uniform consideration. The rules which Packard has adopted under the policy with reference to former employees who joined the colors are as follows:

An employee who left to enter Government service, and who has been honorably discharged, shall receive preference over other applicants for any vacancy which he may be competent to fill. Whenever possible, Packard employees honorably discharged from uniformed service will be assigned to their former positions or to work equally remunerative. If they are not able to resume their former occupation, every effort is to be made to place them in accordance with their present ability.

To facilitate the operation of this rule, department heads are authorized to replace whenever necessary employees who have entered Packard service since April 6, 1917. Applications for re-employment from employees who entered salaried civilian positions under the Government will be considered on their merits, and every effort will be made to provide employment if a suitable vacancy exists.

To receive consideration under these rules, an employee must have entered the Government service within 30 days of leaving Packard employ, and must make application, for re-employment within 60 days of his discharge. In administering these rules, employees who have served under the governments of any Allied nations will rank equally with those who have been in United States service. Absence in Government service will not be deducted in determining length of service in Packard employ.

American Chamber of Commerce in Buenos Aires

WASHINGTON, Dec. 28—The American Chamber of Commerce has been established in Buenos Aires, succeeding the American Commercial Club. It has 85 members who contributed 60,000 pesos as an initial fund in addition to annual dues of 240 pesos each. The organization is prepared to give information and advice to American manufacturers, to consider arbitration questions, and to assist the development of trade.

Col. Wall Will Return to Peace Duty

WASHINGTON, Dec. 30—Lt. Col. W. G. Wall, who was the Chief Engineer of the National Motor Car Co., Indianapolis, and who during the war has been in the Ordnance Department engaged in the design and construction of tractors and tanks, will remain in Washington until Jan. 15 at which time he will resign to return to the National company in his former capacity as chief engineer.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Evinrude May Expand

MILWAUKEE, Dec. 30—The Evinrude Motor Co., a pioneer manufacturer of detachable rowboat engines, expects to make a decision soon on the question of erecting and equipping a complete new plant at the northern limits of Milwaukee, a project which was to have been undertaken a year and a half ago, but indefinitely postponed because of conditions growing out of the declaration of a state of war. The company early in 1917 purchased a large tract of land for the proposed new plant and had prepared tentative plans for the new works. When this is built the Evinrude company intends to enlarge its line of production to include crude oil engines in various types, continuing its present principal product. J. F. Koch is treasurer of the company.

Export Office for Gibson

NEW YORK, Dec. 30—The Gibson Co., Indianapolis jobber, has opened an export office at 27 William Street. It is in charge of I. B. Moers until recently Pacificic Coast's manager for the King Motor Car Co., Detroit.

Bodies Coming from Milwaukee

MILWAUKEE, Dec. 30—The Wisconsin Body & Sales Co. has been incorporated with a capital stock of $15,000 to manufacture motor car and truck bodies for the commercial and custom trade. The incorporators are W. A. Rosenwald, G. Steger and B. M. Rosenwald.

Michigan City Foundry to Start

CHICAGO, Dec. 30—The Michigan City Foundry and Machine Co. will break ground here early in the spring for a foundry which will make a specialty of castings. Albert F. Fort is the moving spirit behind the venture and associated with him will be W. K. Greenebaum, as secretary of the company.

Becker Mfg. Co. Incorporates

MILWAUKEE, Dec. 30—The Becker Mfg. Co., Two Rivers, Wis., which has been operating an iron foundry in that city for many years, has incorporated its business under the same style, with a capital stock of $25,000. Michael P. and Frank T. Becker, the principal owners, continue to hold the controlling interest and will be the officers of the new corporation.

To Sell Monroe Plant

PONTIAC, MICH., Dec. 28—The plant of the defunct Monroe Motor Co. will be sold on the premises Saturday, Jan. 25, 1919, by the receiver, Robert T. Armstrong. The factory contains 100,000 sq. ft. of floor space.

Coast Office for Wellman-Seaver-Morgan

CLEVELAND, Dec. 30—The Wellman-Seaver-Morgan Co. has opened a San Francisco office at 415-417 Rialto Building, in charge of Norman S. Ross. Business originating from California, Nevada west of the 115th meridian, lower California and the counties of Josephine, Jackson and Klamath in Oregon will receive the prompt attention of Mr. Ross.

Castings from Hartford, Wis.

HARTFORD, WIS., Dec. 30—A new gray iron and semi-steel foundry is being established here by Robert LaPointe and Samuel B. Powers, who have leased the casting shop erected and equipped several months ago by Irving L. Bonniwell. The foundry will be operated under the style of Hartford Foundry Co. and will specialize in automotive parts.

Hel-Fi Buys Motor Accessories

CHICAGO, Dec. 28—The Hel-Fi Co., Belvidere, Ill., has purchased and taken over the entire assets and business of the Motor Accessories Mfg. Co., formerly located at Marshalltown, Iowa, and will continue the manufacture and distribution of the Hel-Fi line of spark plugs. C. C. Eldridge, formerly president of the Motor Accessories company, is president of the new organization, which has been organized to provide for further financing.

Everwear Rubber Buys Plant

MILWAUKEE, WIS., Dec. 30—The Everwear Rubber Co., Milwaukee, organized recently with a capital stock of $200,000 to manufacture a patented semi-pneumatic inner tire, has purchased the plant of the Petley Rubber Mfg. Co., 241-247 Oregon Street, which has been manufacturing rubber bumpers, mechanical rubber goods and specialties. The Everwear company will continue that business as a department.

More Room for Gillette

EAU CLAIRE, WIS., Dec. 30—The Gillette Rubber Co., which some time ago established a new department for the manufacture of solid tires, is enlarging its works by the erection of a brick addition, 40 x 125 feet, to accommodate inspection, shipping and warehouse departments. The space thus released will be used for manufacturing.

Dividends

Pierce-Arrow Motor Car Co., quarterly, $1.25, payable Feb. 1.

Curtiss Aeroplane & Motor Co., semi-annual, 3½ per cent on preferred, payable Jan. 15.

Emerson-Brantingham Co., quarterly, 1¾ per cent, preferred.

Falls Tractor Engine Coming

MILWAUKEE, Dec. 30—The Falls Motors Corp., Sheboygan Falls, Wis., will place in operation on Jan. 2 a large plant addition representing an investment of more than $225,000, enabling it not only to increase its output of passenger and commercial car power units, but also to engage in the production of a special tractor type, heavy duty motor. A considerable volume of business in the new tractor engine has been booked, and with the other orders now in hand, the operation of the enlarged plant at full capacity for many months ahead already has been assured.

Mitchell Toolmakers Return

RACINE, Dec. 30—Between 100 and 150 toolmakers employed by the Mitchell Motors Co., returned to work Dec. 20 after a strike of 10 days' duration. Differences arose over working hours and these have been adjusted by federal labor conciliators. It is said the Mitchell company desired to establish a 10-hour day, but the men insisted on an 8-hour day, with time and one-half for overtime.

Stinson Tractor to Build

SUPERIOR, WIS., Dec. 30—The Stinson Tractor Co. will commence operations in its new assembling plant at Superior, Wis., on Jan. 2, with a force of about 60 operatives. The work of equipping the former plant of the Continental Motor Truck Co. in Superior has been completed and material and parts have been provided in sufficient quantity to insure a daily output of one tractor, which will be increased as rapidly as equipment and stock are sufficiently enlarged.

New York Office for Hess

BALTIMORE, Dec. 30—The Hess Steel Corp. has established a branch office at 50 Church Street, New York City. Daniel V. Foster, who is now representing the Hess corporation in that district, will be in charge.

Government Still Needs Tires

WASHINGTON, Dec. 30—Government purchase of tires for motor trucks in this country and abroad continue in large quantities. Orders were placed on Dec. 17 for $1,000,000 worth of tires with the Goodyear, Kelly-Springfield, Fisk, Firestone, United States and Pennsylvania tire companies. An order at the same time was given to the Trailmobile Co., for 1000 cargo trailers. Following is the list:

Trailmobile Co., Cincinnati, Ohio, 1000 cargo trailers, $596,000.

Goodyear Tire and Rubber Co., Washington, 5750 casings, 6000 tubes, $230,720.

Kelly-Springfield Tire Co., Cleveland, 2000 tires, $80,680.

Fisk Rubber Co., Washington, 3765 casings, $57,003.50.

Firestone Tire and Rubber Co., Akron, 1965 casings, 5875 tubings, $76,874.25.

United States Tire Co., New York, casings and tubes, $388,112.50.

Adopt Standards for Women

Department of Labor Specifies Equal Pay and 48-Hour Week—Complete Rules

WASHINGTON, Dec. 30—Standards have been arranged by the Department of Labor to deal with working conditions for women, including wages, hours, employment and training. Equal pay for equal work, 48-hr. week and joint negotiation between employers and groups of employees are among the standards. Inquiries regarding the employment of women and all problems connected with this can be addressed to the Woman in Industry Service, Department of Labor, Washington, D. C. Following is the complete outline of the standards as approved by Secretary of Labor Wilson:

Hours of Labor

1. **Daily hours.**—No women shall be employed or permitted to work more than eight hours in any one day or 48 hours in any one week. The time when the work of women employees shall begin and end and the time allowed for meals shall be posted in a conspicuous place in each work room and a record shall be kept of the overtime of each woman worker.
2. **Half holiday on Saturday.**—Observance of the half holiday should be the custom.
3. **One day of rest in seven.**—Every woman worker shall have one day of rest in every seven days.
4. **Time for meals.**—At least three-quarters of an hour shall be allowed for a meal.
5. **Rest periods.**—A rest period of ten minutes should be allowed in the middle of each working period without thereby increasing the length of the working days.
6. **Night work.**—No women shall be employed between the hours of 10 p. m. and 6 a. m.

Wages

1. **Equality with men's wages.**—Women doing the same work as men shall receive the same wages with such proportionate increases as the men are receiving in the same industry. Slight changes made in the process or in the arrangement of work should not be regarded as justifying a lower wage for a woman than for a man unless statistics of production show that the output for the job in question is less when women are employed than when men are employed. If a difference in output is demonstrated the difference in the wage rate should be based upon the difference in production for the job as a whole and not determined arbitrarily.
2. **The basis of determination of wages.**—Wages should be established on the basis of occupation and not on the basis of sex. The minimum wage rate should cover the cost of living for dependents and not merely for the individual.

Working Conditions

1. **Comfort and sanitation.**—State labor laws and industrial codes should be consulted with reference to provisions for comfort and sanitation. Washing facilities, with hot and cold water, soap, and individual towels, should be provided in sufficient number and in accessible locations to make washing before meals and at the close of the work day convenient. Toilets should be separate for men and women, clean and accessible. Their numbers should have a standard ratio to the number of workers employed. Workroom floors should be kept clean. Dressing rooms should be provided adjacent to washing facilities, making possible change of clothing outside the workrooms. Rest rooms should be provided. Lighting should be arranged so that direct rays do not shine into the workers' eyes. Ventilation should be adequate and heat sufficient. Drinking water should be cool and accessible, with individual drinking cups or bubble fountain provided. Provision should be made for the workers to secure a hot and nourishing meal eaten outside the workroom, and if no lunch rooms are accessible near the plant, a lunch room should be maintained in the establishment.
2. **Posture at work.** — Continuous standing and continuous sitting are both injurious. A seat should be provided for every woman employed and its use encouraged. It is possible and desirable to adjust the height of the chairs in relation to the height of machines or work tables, so that the worker may with equal convenience and efficiency stand or sit at her work. The seats should have backs. If the chair is high a foot rest should be provided.
3. **Safety.** — Risks from machinery, danger from fire and exposure to dust, fumes, or other occupational hazards should be scrupulously guarded against by observance of standards in State and Federal codes. First-aid equipment should be provided. Fire drills and other forms of education of the workers in the observance of safety regulations should be instituted.
4. **Selection of occupations for women.**—In determining what occupations are suitable and safe for women, attention should be centered especially on the following conditions which would render the employment of women undesirable if changes are not made:
   A. Constant standing or other postures causing physical strain.
   B. Repeated lifting of weights of 25 pounds or over, or other abnormally fatiguing motions.
   C. Operation of mechanical devices requiring undue strength.
   D. Exposure to excessive heat—that is, over 80 deg., or excessive cold—that is, under 50 deg.
   E. Exposure to dust, fumes, or other occupational poisons without adequate safeguards against disease.
5. **Prohibited occupations.**—Women must not be employed in occupations involving the use of poisons which are proved to be more injurious to women than to men, such as certain processes in the lead industries. Subsequent rulings on the dangerous trades will be issued.
6. **Uniforms.**—Uniforms with caps and comfortable shoes are desirable for health and safety in occupations for which machines are used or in which the processes are dusty.

Home Work

No work shall be given out to be done in rooms used for living or sleeping purposes or in rooms directly connected with living or sleeping rooms in any dwelling or tenement.

Employment Management

1. **Hiring, separations, and determination of conditions.**—In establishing satisfactory relations between a company and its employees, a personnel department is important charged with responsibility for selection, assignment, transfer or withdrawal of workers and the establishment of proper working conditions.
2. **Supervision of women workers.**—Where women are employed, a competent woman should be appointed as employment executive with responsibility for conditions affecting women. Women should also be appointed in supervisory positions in the departments employing women.
3. **Selection of workers.**—The selection of workers best adapted to the required occupations through physical equipment and through experience and other qualifications is as important as the determination of the conditions of the work to be done.

Co-operation of Workers

The responsibility should not rest upon the management alone to determine wisely and effectively the conditions which should be established. The genuine co-operation essential to production can be secured only if definite channels of communication between employers and groups of their workers are established. The need of creating methods of joint negotiation between employers and groups of employees is especially great in the light of the critical points of controversy which may arise in a time like the present. Existing channels should be preserved and new ones opened if required, to provide easier access for discussion between employer and employees.

Champion Machine to Build

CLEVELAND, Dec. 30—The Champion Machine & Forging Co. has purchased a block of land adjoining its plant at 3695 East Seventy-eighth Street, on which a forgeshop is now being erected.

Canada Has 250,000 Motor Cars

Dominion Has One Car for Every 32 Persons—Eleven Manufacturing Plants

WASHINGTON, Dec. 30—Two hundred and fifty thousand automobiles are in use in Canada at present, according to a Consular Report, which states that in 1914 there were 67,415 and in 1917 there were 189,320 cars in use.

With an estimated population of 8,000,000 there is one passenger car in use at present for every 32 inhabitants, as against one for every 118 inhabitants 4 years ago. The number of cars in use in Ontario this year is estimated at 110,000.

Statistics have been compiled showing the occupations of car owners throughout the country, according to Consul Felix S. S. Johnson, Kingston, Ontario, and from this, says the report, it is apparent that 90 per cent of all the cars in use are owned by persons whose occupations are such that the automobile in their hands is a utility enabling them to do more and better work. Nearly one-half the cars in use are the property of farmers.

A preliminary report of a census of the automobile and other allied industries has been compiled by the Dominion Bureau of Statistics. The census covered the operations of establishments engaged in the manufacture of (1) automobiles, (2) automobile accessories and (3) automobile repairs.

The number of establishments classed as manufacturers of automobiles in Canada in 1917 was 11, in automobile accessories 24 and in repair work 497.

The total capital invested in these industries was $35,780,677, apportioned as follows: In automobiles $28,192,858, in accessories $3,155,893 and in repairshops $4,431,926.

The number of persons employed on salaries was 730 males and 174 females in automobile plants, 106 males and 21 females in accessory plants, and 254 males and 48 females in repairshops and garages. The total salaries paid were respectively $1,376,692 in automobile plants, $266,147 in plants making accessories and $334,780 in repairshops.

The number employed on wages in each class and the amount paid in wages were as follows:

	Number Males.	Number Females.	Wages
Automobile plants	4,852	164	$4,862,779
Accessory plants	1,405	122	1,198,596
Repairshops	1,508	34	1,200,958

The value of materials used in manufacturing and repair work in each class was (1) automobiles $35,585,820, (2) accessories $3,788,308 and (3) repairs $1,961,773.

The total value of production and repair work for all classes was $66,053,207, of which automobiles amounted to $54,466,273, accessories to $6,495,868 and repairs to $5,091,066.

The mammoth navy seaplane, which is designated N. C. 1, and which it is now admitted is being held in readiness for an attempt at a transatlantic flight. It is the first American plane to be equipped with three Liberty engines. The wingspread is 126 ft. and the length is 70 ft. from bow to tail. The wings have a gap of 12 ft. and are 12 ft. broad. The flying weight of the machine is 22,000 lb. and it has climbed to 2000 ft. in 10 min.

Government Price of Dodge Cars

WASHINGTON, Dec. 30—A supplementary contract made to Dodge Bros., Detroit, by the Quartermaster Department fixes the price of boxed Dodge cars for export at $51 per crate, on 1500 5-passenger cars, making a total allowance of $76,500 increase in contract No. A-46 for 1500 Dodge cars to $1,327,500. A supplement to contract A-45 calling for 500 Dodge cars at $478,000 includes allowance for crating at $59 per crate, increasing the contract $29,500 to a total of $507,500. Estimated on this basis Dodge 5-passenger cars on contract A-46 have been sold to the Government at a cost of $885 each while on contract A-45 the price was $856 each not including the cost of crating.

Hong Kong Trade Good

WASHINGTON, Dec. 30—Trade in Hong Kong during the past 9 months has been satisfactory, according to a Consular report. Decreasing tonnage, due to the demand for shipping service elsewhere and increasing difficulty of securing supplies, have prevented any great pressure in favor of imports, while on the other hand, the high exchange value of silver has made it impossible to move most lines of Chinese produce. Nevertheless the Hong Kong industry including the shipyards, sugar refineries, knitting and preserve factories have done excellent business and exportation from the United States should find good trade there as quickly as shipping facilities allow. Among the principal items imported to Hong Kong in the past 9 months were $300,000 worth of automobiles and parts.

Foreign Trade Opportunities

WASHINGTON, Dec. 30—An agency is desired by a man in France for the sale of tractors and also by an individual in Switzerland. Further information can be secured on this by addressing the Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C., and mentioning Foreign Trade Opportunity Nos. 27,883 and 27,886.

A commission merchant is desirous to secure an agency of American motor cars and motor trucks. The Bureau of Foreign and Domestic Commerce will give further details on receipt of inquiries asking about Foreign Trade Opportunity No. 27,891.

An agency for the sale of motor car bodies, especially leather, varnishes and trimmings is desired by an individual in France—Foreign Trade Opportunity No. 27,902.

Steel Available in Canada

WASHINGTON, Dec. 30—Millions of tons of steel will now be available for automobile and agricultural implement manufacture in Canada, according to a Consular report, which states that manufacturers in these lines, there are far behind in their orders. A reduction in the high wage of the war is expected but at the same time it is expected that there will be ample employment for all at good wages in Canada. Manufacturers, says the report, do not look for a drop in prices for some time.

New Allen Sedan

FOSTORIA, Dec. 21—The Allen Motor Co. has brought out a new five-passenger sedan on its 112-in. wheelbase, standard chassis. It has disappearing side windows, staggered doors and a passageway between the front seats, and is upholstered in gray and green worsted with a gray top lining and carpet to match. The windows are fitted with silk roller curtains at the rear, and the interior upholstery is over double-decked cushion springs. There is an etched center dome light, robe strap, foot rest and full interior equipment.

The windshild is sloping, with full ventilating features, and has an adjustable rain visor. There is a ventilating fixture on the driver's door, and the door is locked by a thumb latch. On the right hand door there is a Yale lock.

The standard Allen chassis upon which this new sedan is mounted has a four-cylinder 3¾ by 5 engine, a two-unit Autolite starting and lighting system with Connecticut ignition, Stromberg carbureter, Borg & Beck clutch and a full Hotchkiss drive. Gasoline feed is by Stewart-Vacuum system from a 13-gal. tank at the rear. Tires are 33 by 4 and the car sells for $1,795 f.o.b. Ohio.

One of the features of the car is the rotary switch, whcih is mounted on the steering column, directly beneath the steering wheel, controlling the entire electric system, including the starter, ignition, head and tail lamps, dimmers and motor-driven horn. The light for the interior dome light is controlled by a switch within the rear compartment.

Army Planes Head for Washington

WASHINGTON, D. C., Dec. 30—The four army training planes which flew across the continent from San Diego to Jacksonville, and which later flew the length of Florida and back, have started north to Washington, D. C. They left Dorr Field, Arcadia, Fla., at 3:30 p. m., December 27 and arrived at Daytona, Fla., at 6:00 p. m. the same day, flying the last hour of this leg in the rain. The fliers spent the night at Daytona and left this morning for the North. They will continue to collect data and statistics for the army air map and locate sites for landing fields as they proceed. Allowing time for this work and their stops for gasoline it is figured they should arrive at Bolling Field, Anacostia, about January 4.

N. A. C. C. Meeting Jan. 8

WASHINGTON, Dec. 30—The next directors' meeting of the National Automobile Chamber of Commerce will be held in New York on January 8.

Men of the Industry

Changes in Personnel and Position

F. J. Pardee, for the past three years general sales manager for the Diamond T. Motor Car Co., Chicago, has been appointed Western sales manager of the company, and will open headquarters in San Francisco. A. J. Whipple, who has been a special representative of the company in Washington, D. C., has been made general sales manager.

—

A. S. Canton, formerly purchasing agent for the automobile accessories department of the Oliver Bros. Co., New York, is now associated with the A. S. Canton Co., accessory jobber.

—

Glenn B. Miller has been appointed general sales manager of the Nelson Motor Truck Co., Saginaw, Mich.

—

Chester L. Newman, for 20 years manager of the Kansas City branch of the National Analine & Chemical Co., has bought stock in the Employers' Indemnity Corporation, Kansas City, and on Dec. 27 became vice-president of the corporation. He will manage the new department of reinsurance, which is growing rapidly. The department reinsures both insurance companies and firms which carry their own insurance, on automobile liability, employers' liability and compensation, carrying the excess above the maximum amounts which such reinsured concerns care to cover for themselves. The corporation also provides a special coverage in automobile collision insurance "as interest may appear."

—

John F. Evans, Evans Motor Sales Co., National distributer in Detroit has been appointed representative of the Gillette Rubber Co. He will be general manager of the Detroit Gillette branch which will be styled Gillette Rubber Co. of Michigan.

—

A. W. Dunop, connected with the railway sales department of the United States Light & Heat Corp., Niagara Falls, N. Y., has been promoted district manager and engineer in charge of the San Francisco branch.

—

George L. Ritter has been appointed assistant sales and advertising manager of the Duplex Engine Governor Co., Brooklyn, N. Y. He was formerly secretary to the president of the company.

—

T. B. Fogg has been appointed branch supervisor of the Garford Motor Truck Co., Lima, O., and is head of a new Department of Supervision.

—

J. F. Bowman has been appointed Detroit sales manager of the Garford Motor Truck Co., Lima, O. He succeeds S. M. Williams who has taken charge of the company's new Highway Development Department.

—

Wade H. Leach assumed the duties of general sales manager of the Dort Motor Car Co., Dec. 1. For the past 2 years he has been interested in the Chicago Motor Co., Chicago, Jordan distributer.

—

A. G. Cameron, manager of the Goodyear Tire & Rubber Co. at St. Louis, has been promoted to charge of the Australasia trade. He will spend several months each year in the South Seas. P. D. Winnings, assistant manager at St. Louis, is in charge pending a permanent appointment.

C. L. Fox, assistant sales manager of the Saxon Motor Car Corp., Detroit, has returned from the officers' training school at Jacksonville, Fla., where he was in training in the Motor Transport Corps. He will resume his work at the Saxon factory Jan. 1.

—

Leo Lunenschloss, for 6 years manager of the principal Wisconsin sales office of the Avery Co., Peoria, Ill., in Madison, Wis., has been promoted to the position of foreign sales agent, with headquarters for the time being at the Peoria works. He is succeeded by R. B. Lyman, Watertown, S. D., as manager at Madison.

—

Horace N. Trumbull, who has recently received his discharge from the Engineers Officers' Training School at Camp A. A. Humphreys, Virginia, has been appointed advertising manager of the Wellman-Seaver-Morgan Co., Cleveland, Ohio. Before entering the service, Mr. Trumbull was advertising manager of the S. K. F. Ball Bearing Co., Hartford, Conn.

—

Fred D. Williams, formerly head of the power specialties department of the H. W. Johns-Manville Co., and who associated himself with the L. H. Gilmer Co., Philadelphia, as assistant general manager on April 29 last, has now been appointed general manager.

—

Prohibit All Price-Fixing

WASHINGTON, Dec. 30—Concerted price fixing by any industry after the Government ceases to exercise price control on Jan. 1, will be regarded as in restraint of free competition by the Department of Justice, it was stated to-day. This explanation was made in reply to an inquiry as to what would happen to war time price fixing when the War Industries Board ceases to function on Dec. 31.

Front Entrance Inside Drive Body

(*Continued from page 5*)

only 48½ in. between floor and roof. This is 3½ in. less than would be considered fair or average height, but the design must be lower than usual, as the body is short, and this makes it look pyramid-like unless the perpendicular dimension is cut down.

This design is intended to use the regular form of metal panel and wood frame construction with a heavy line molding at the belt or middle, and a slight round corner at the rear. It can, however, be considerably modified in weight if the material forming the back and side quarters be of cloth as well as the roof. This construction will be used in the near future, as there is a strong tendency now to have the upper part of the body lighter. There is no reason from the standpoint of durability or comfort that will prevent it, but it is at present thought to be so radical that builders hesitate to suggest it. So far no material is just satisfactory; the khaki cloth is the best-looking material and is satisfactory in keeping out the rain and cold, but it does not wear well; it loses its clean-cut appearance in a short time and cannot be satisfactorily and easily cleaned to look like new.

Of many other materials, principally black in color, the same objection exists as far as service is concerned. Nearly all look cheap when used for this purpose; leather is ideal for appearance and service, but is not cheap, considering the length of time that it will stay in shape. When any of the cloth or leather materials are used the body is made square cornered at the rear, as this is more practical, as well as more easily constructed.

The design has been made to accommodate the prevailing tendency to make the most lasting job—that is, with the metal panel construction; the short digression above is simply to help in a missionary way the wish of all body builders to have the bodies made lighter than they now are, and when the public shares to the same extent the views of the practical man this will be quite easy of accomplishment.

48 Get New York Show Space

(*Continued from page 29*)

In Madison Square Garden a balcony will be built, but not as large as that used in former years. It will house the accessories. Instead of cars being placed on a balcony in the Garden as heretofore there will be a second show in the Sixty-ninth Regiment Armory, a few steps from the Garden. A two-piece ticket will admit to both buildings. This will permit all the cars to be shown on the ground floor.

So far as the shows are concerned the visitor will never know whether they are promoted by the N. A. C. C. or the dealers. The old cars, the old faces and all the old atmosphere will be there. The Chicago show even has the manager of other years, Sam Miles, who was engaged a few days ago to manage that exposition.

In the drawing for the New York show, held at the Automobile Club of America last Saturday morning, the older members drew first, then a group of later members, and then the non-members who had made application. In addition to these there are quite a number of applicants expected, and there are only about a half dozen spaces left to allot.

The Chicago drawing was held at the Lexington at 3 o'clock Friday afternoon. There were 62 applications from passenger car dealers and 27 from truck companies. The New York truck drawings will not be held until Saturday of this week.

The receipts of the New York show will go to the New York Automobile Dealers' Association and the members. The receipts of the Chicago show will be divided among the Chicago Automobile Trade Association, the Chicago dealers, the N. A. C. C. and the Motor and Accessory Manufacturers' Association, which has sanctioned the Chicago and Boston shows. The New York show has not been sanctioned by the M. A. M. A.

The spaces allotted in the Chicago passenger car section follow:

Car	Space	Building
Overland	D-1	Coliseum
Buick	C-5	Coliseum
Dodge	B-2	Coliseum
Studebaker	A-6	Coliseum

Post Office Motor Transport Service

WASHINGTON, Dec. 30—That there should be a Post Office Motor Transport Service connecting communities "like veins and arteries of the body," was the emphatic statement of Congressman M. Clyde Kelly Saturday before Congress. Mr. Kelly pointed out the important work performed in Europe during the war by the motor truck, and told how the soldiers were fed by motor transport. Using this description as a parallel instance, he stated himself emphatically in favor of the development of the Motor Transport Service in the United States.

Discuss Tax Elimination

WASHINGTON, Dec. 30—The Conference Committee representing the House and the Senate is now discussing the elimination from the Revenue bill of the 5 per cent tax on trucks, tractors, trailers and truck parts and it is expected that a satisfactory agreement will be reached to keep this from the bill. It is also considered possible that the 5 per cent tax on the parts and accessories of passenger cars will be removed.

National Tool to Make Trucks

ST. LOUIS, Dec. 30—The National Tool & Mfg. Co. is shortly to enter the market with a ¾ and a 1-ton truck. These will be placed on the market in six or eight months. The truck will be an assembled job.

Shop Committee Idea Spreading

WASHINGTON, Dec. 30—Shop committees for adjusting employees' grievances, and thus avoiding industrial disturbances, are being established and are working successfully in a number of American factories, according to bulletins issued by the Economics Division of the Information and Education Service, United States Department of Labor.

A large metal finishing plant in the State of New York started shop committees as a result of a strike, which it was found could have been avoided had there been means of discussion between the company and its men. Since the adoption of the plan every complaint has been adjusted satisfactorily. The plan is as follows:

Each department has an accredited representative on the committee, which elects an executive committee of five. The representatives meet every Friday, and two representatives of the management meet the executive committee in an office set aside for the purpose of discussing and adjusting grievances.

All complaints must be made in writing and submitted to the department representative by the complainant. The representative tries to adjust the matter with his foreman. If he fails he submits it to the next meeting of the shop committee. If the representatives can not adjust the grievance they turn it over to the executive committee, which takes it up with the representatives of the management. If they fail to agree the complaint is referred to the factory manager, who must take it up with a representative selected by the executive committee. In case this resort fails the dispute is passed on to an arbitration committee, whose decision is final and binding on both sides. The arbitration committee consists of five men, two selected by the management, two by the executive committee, and the fifth by these four.

Hanch Quits Washington Jan. 15

WASHINGTON, Dec. 30—C. C. Hanch, Chief of the Automotive Section, War Industries Board, will probably complete his official duties in Washington by Jan. 15 and will at that time return to the Studebaker Corp., South Bend, Ind., of which Mr. Hanch is the treasurer. The Automotive Section is winding up its affairs as rapidly as possible, now completing a report in conjunction with the other sections of the board to be compiled into one complete statement of the board's activities by Bernard M. Baruch.

To Provide Against Unemployment

WASHINGTON, Dec. 30—Felix Frankfurter, Chairman of the War Labor Policies Board, has been named by Secretary of Labor Wilson to take charge of the work of providing against unemployment "through stimulation of public works and state, county and municipal roads."

"Rick" To Fly For Loan

WASHINGTON, Dec. 30—Eddie Rickenbacher, American ace in the Flying Service in Eurpe, may make a series of flights through the United States this spring under the auspicies of the Treasury Department at the time of the next Liberty Loan. The Treasury Department is now negotiating with the War Department on this matter.

Managers' School to Be Opened

Thirty Representatives from 15 States Convene in Washington January 6

WASHINGTON, Dec. 23—The U. S. Employment Service of the Department of Labor will open its first school for employment managers on Jan. 6. The course will extend over two weeks. Thirty employees of the Employment Service of the Government, representing 15 states, will attend the first school, and upon completion of the course will be returned to their own state, where they will train their own examiners for service.

The purpose of the course is to produce a trained and efficient staff to make standard the use of a common agency under the Government for labor distribution and placement. Following are the subjects to be covered:

First Day—Explanation of Reasons for and Methods of Conference and Training in State. Purpose and Development of U. S. Employment Service. Present Industrial Conditions. Competitive Basis but maintaining Advanced Standards gained in War Periods. Necessity for knowing Local Conditions. The limited but vital part of the Employment Bureau in the field of Industrial Adjustment.

Second Day—Round Table on Office Layout. General Discussion of Work to Date. Functions of Director General. Contacts with Department of Labor, etc. What the Examiners Should Note in Modern Industrial Production. Special Agencies with Which Examiners Must Work. Need for Local Survey of Community. Industrial, Labor and Government Agencies. Knowledge of Their Standards.

Third Day—Round Table on Interviewing and Placement. Plans for Demobilization of Soldiers and War Workers. Enlightened Industry and the U. S. Employment Service.

Fourth Day—Interviewing Placement. Fiscal and Personal Regulations. Special Considerations in Placing Women.

Fifth Day—Round Table on Special Departments. Field Organization. Co-ordination of Sections and Groups within Service. The Examiner and his contact with employers, organized Labor and the Service.

Sixth Day—Trade Tests. The Morale of the Service. Dinner and good fellowship.

Eighth Day—Functions of Federal Director State Organization — Contact with Labor and Jobs. Clearance in States. Round Table on Reports and Forms. Trade Tests.

Ninth Day—Organization of Local District. Labor Community Boards. Survey of Community Needs and Possibilities. Clearance Summing Up. Round Table on Files and Filing.

Tenth Day—Organization and Work in Local Office. Sources of Work. Round Table on Job Soliciting. Employment Experiences Abroad and Successful Extension Here.

Eleventh Day—Special Problems in Junior Placement. Special Problems Relating to Handicapped. Round Table on Recruiting.

Twelfth Day—Round Table on Casual Labor: Industrial, Railroad, Farm, Day Work (Domestic). The Organization of the Casual Labor Market. Written examination. Summing Up Course and Methods of Training in States. The Potential Permanent Value of the U. S. Employment Service.

Thirteenth Day— Individual Conferences. Instructions on Methods of Training and Rating Examiners.

Moto-Meter Opens Detroit Branch

DETROIT, Dec. 30 — Following its policy of expansion, the Moto-Meter Co., Inc., Long Island City, New York, has opened a direct factory branch at 1432 Dime Bank Building, Detroit. The office will be in charge of J. J. Tobias.

Allied Tin Pact Broken by U. S.

WASHINGTON, Dec. 30—Cancellation of the inter-allied tin agreement has been announced by the War Industries Board. This places tin again under the control of the British Rubber and Tin Exports Committee. Negotiations for the protection of the American tin industry from price manipulation have been pending for many days between representatives of the tin industry and the importers favoring the inter-allied tin agreement, arrangements for which were not completed before Mr. Baruch and Vance McCormick left for Europe.

Prior to the negotiation of the inter-allied tin agreement the Rubber and Tin Exports Committee controlled the exports of tin from Great Britain and the export permits there were restricted to a limited number of merchants who enjoyed a monopoly thereby and were enabled to charge a premium of from 5 to 20 cents a pound.

At present the English market is about 10 cents below the American price and those favored concerns buying in England and selling here have enjoyed the high profit resulting. It may be necessary, it was said here to-day, to invoke the embargo power of the War Trade Board to secure equitable arrangements for the entire American tin industry.

International Harvester Head Quits

CHICAGO, Dec. 31—Cyrus H. McCormick has been succeeded as president of the International Harvester Co. by his brother Harold F. McCormick. Cyrus H. becomes chairman of the board of directors, having been continuously affiliated with the International company for 32 years, 16 years as head of the concern and 18 years as head of the McCormick Co.

Postpone Jobber Suit

NEW YORK, Dec. 31—The trial of the twenty-one members of the Automotive Equipment Association, formerly the National Association of Automobile Accessory Jobbers, on the charge of violating the Sherman anti-trust law has been postponed. It was originally scheduled for Jan. 6 but has been put off until Jan. 13 because Judge Hand, who is to try the case, is at present engaged with the Postal Telegraph demurrer action against the Government and will not be through with it until after Jan. 6.

Buick Price Down $100

FLINT, MICH., Jan. 2—The Buick Motor Co. has revised its prices effective at once. Following are the new and old prices:

Model	New Price	Old Price
3-Pass. open	$1495	$1595
5-Pass. open	1495	1595
4-Pass. closed	1985	2085
5-Pass. closed	2195	2195
7-Pass. open	1785	1885
7-Pass. closed	2585	2585

No alteration has been made in the construction of the various models.

CONTINENTAL MOTORS
Powerful as the Nation
AMERICA'S STANDARD

"Yes, That's the Motor for Us. There's the Continental Red Seal"

The more thorough and complete the knowledge of motor values, the stronger is the insistence upon the Red Seal Continental Motor.

For the experienced motorist knows that satisfaction in the ownership of an automobile depends largely upon the power, the speed, the economy, the reliability of the motor.

He knows also that the possession of these qualities can be determined with certainty only by past performance, the infallible test of motor worth.

For well over a decade the Red Seal Continental Motor has undergone the test of performance in hundreds of thousands of automobiles and trucks. Under every conceivable condition of service—in the arduous tasks of commerce, on the mud-drenched roads of France—it has proved its 100% dependability.

Today tens of thousands of owners will have no other motor. Upwards of 15,000 dealers base their business prosperity on Continental-equipped cars. More than 160 successful manufacturers of automobiles and trucks have selected the Continental after exhaustive tests and most careful analysis of its record.

Look for the Red Seal on the motor in the car or truck you buy—it's your guarantee of motor satisfaction.

VOL. XL NEW YORK—THURSDAY, JANUARY 9, 1919—CHICAGO No. 2

First Description of the Ford "Baby" Tank

A Two-Man Fighting Machine Having a Duplicate Ford Automobile Power Plant—Radiator Mounted at Rear in Most Protected Position—Worm Drive—Armor Plate Body Forms Chassis Frame

DURING the closing period of the war the U. S. Army Ordnance Department prepared plans for manufacturing by thousands a small tank officially known as the 3-ton special tractor. Popularly, these tanks were known as Ford tanks, because they were equipped with many standard Ford parts, and, in fact, were built around the Ford powerplant in such a way that the tremendous capacity of this factory could have been used to turn out hundreds of these special 3-ton tractors, or little two-man tanks, per day. It is difficult to imagine how far this program would eventually have been carried. These tanks might have largely taken the place of infantry to form the first two or three waves of an attacking force.

The 3-ton special tractor is an armored, two-man type, equipped with one Browning tank machine gun, U. S. caliber 30, Model 1918, mounted on the left side of the tractor, and operated through a ball mounting in the armor cover of the front of the tractor. The tractor is driven by two 4-cylinder Model T Ford engines, placed parallel to each other. Each of these engines drives one track, but there is an idler gear interposed between the two engines, meshing with a toothed ring on each flywheel, which synchronizes the powerplants and virtually makes the two a single unit. From the engines the power is transmitted through two standard Ford planetary transmissions with disk clutches, two worm gears, axle shafts and drive sprockets to the creeper track.

Powerplant in Rear

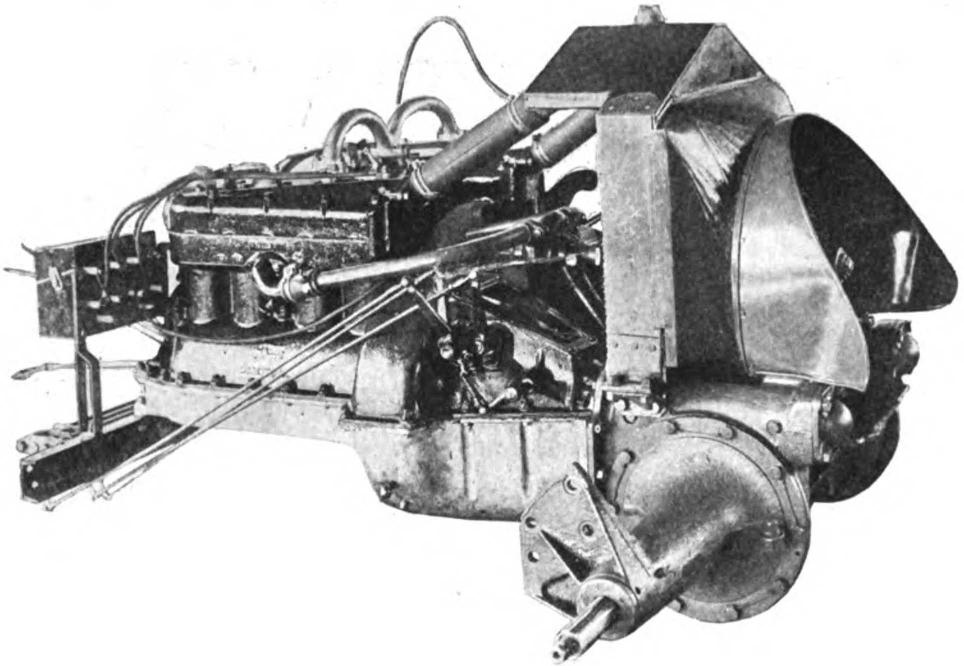
The powerplant is located in the rear, and the operator and gunner are in the forward end of the tractor, the gunner's position being at the left of the driver. The entire tractor is enclosed in armor plate, which varies in thickness from ¼ to ½ inch, this being sufficient to withstand machine gun and rifle fire.

Each engine delivers its power through a conventional multiple disk clutch, in a unit with and directly behind the planetary transmission, to the worm gear, and thence through a transverse shaft, on the outer end of which is mounted the sprocket that imparts the drive to the track itself. Releasing either clutch makes the track on that side of the tractor inoperative and the track on the other side operates to turn the tractor in a circle. If a shorter turning circle is desired, one track may be operated at low speed by manipulation of the planetary transmission.

Track Operation

Track operation is effected by large driving sprockets actuated by the worm gears within the body of the tractor. These driving sprockets are at the rear end of the tractor. At the forward end there are blank or idler sprockets of larger diameter than the driving sprockets, the only functions of these being to guide the track and to regulate its tension. There are two track-supporting rollers mounted above a semi-elliptic spring bracketed to the outside of the tractor armor, which carry the weight of the upper part of the track. The tractor has a nominal forward speed of between 10 and 12 m.p.h., and as a result of its great gear reduction and the peculiarities of its track-laying propulsion, is capable of obtaining traction up to any tractive angle and over ground unusually difficult, such as would be found in territory marked by shell craters.

The armor plate forms the body structure as well, there being no frame. The armor has continuous riveted steel joints, except the rear end, which is bolted so that it can be removed to give access to the powerplant.



Assembly view of powerplant, showing radiator over rear axle

Quarter-inch steel plate forms the floor of the body. The rear axle is bolted to the sides of the tractor at the extreme rear, the housings of the two worm gears hanging through openings in the floor. To the lower corners of each side of the tractor is fastened the light armor plate structure inclosing the track roller assembly, which includes the track chain and a built-up inverted U-beam in which the track roller mechanism is carried.

The powerplant is bolted directly to the rear axle housing, through the medium of flanges near the ends. The front end of the powerplant rests at two points on the U-beam that carries the control-lever assembly, which in turn is bracketed to the side of the armor plate.

The engine cylinders are block cast, and are of the L-head type, with the cylinder heads removable. The cylinders have a bore of 3¾ in. and a stroke of 4 in., the engine developing 34 hp. at 1700 r.p.m. The firing order is 1-7-2-5-4-6-3-8, No. 1 cylinder being the cylinder nearest the coil box on the right-hand side of the powerplant, looking from the rear of the tractor, and the opposite block numbering 5-6-7-8, No. 5 being opposite No. 1.

Each crankcase is a single casting of aluminum, with the oil base or sump integral. With this type of construction it is necessary to remove the entire powerplant from the tractor if the crankcase is to be removed or internal adjustments are to be made. The camshafts are gear-driven from the crankshafts. The magneto is a special Ford design, built in and made a part of the flywheel.

The fuel supply to the Kingston carbureter is by gravity. Lubrication is by splash, with gravity circulation, no oil pump being required. A brass tube running from the flywheel to the timing gear housing supplies oil for the timing gears and crankcase. The oil is collected by the funnel end of the tube, and, as the timing-gear housing end is lower than the flywheel housing end, it flows in the direction of the former.

Cooling water is circulated by a centrifugal pump which is driven by the same shaft as the fan, the pump being mounted between the two cylinder blocks. Both the pump and the fan are positively driven through a train of gears off the idler gear interposed between the two flywheels.

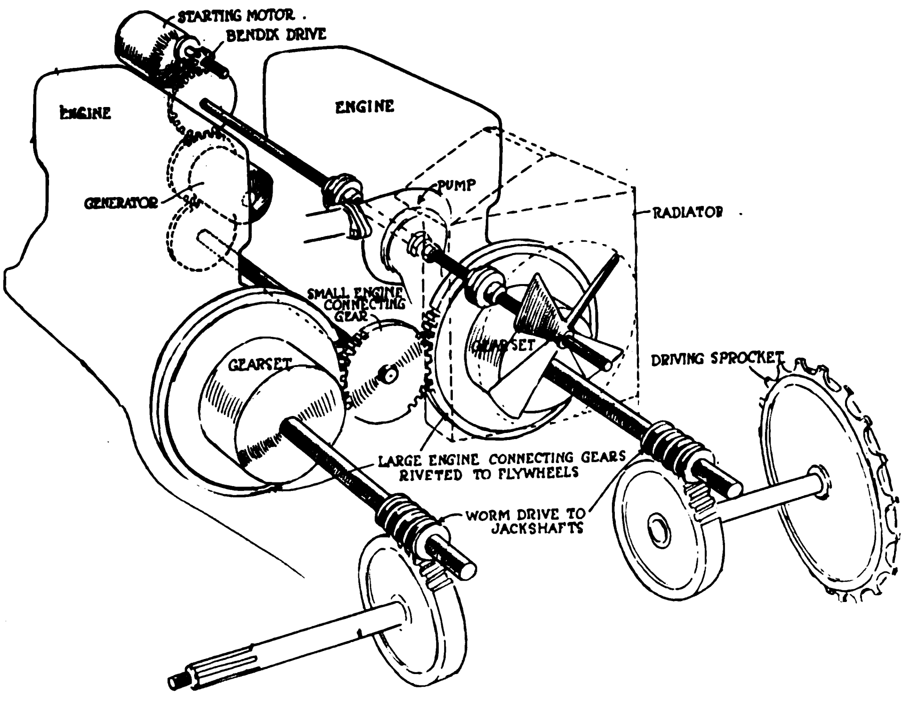
The cylinders are block cast, with integral waterjackets. Each block is drained separately by means of a petcock at the lowest point on the pipes leading from the pump to the cylinder blocks.

The pistons are of gray iron and have three rings each—two above the piston pin and one below.

The piston rings, of which there are three to a cylinder, are of the miter-cut type. All three are tapered from top to bottom; that is, the upper side is slightly smaller than the bottom. This provides a scraping edge to the lower side and prevents an excess of oil passing the piston and reaching the combustion chamber.

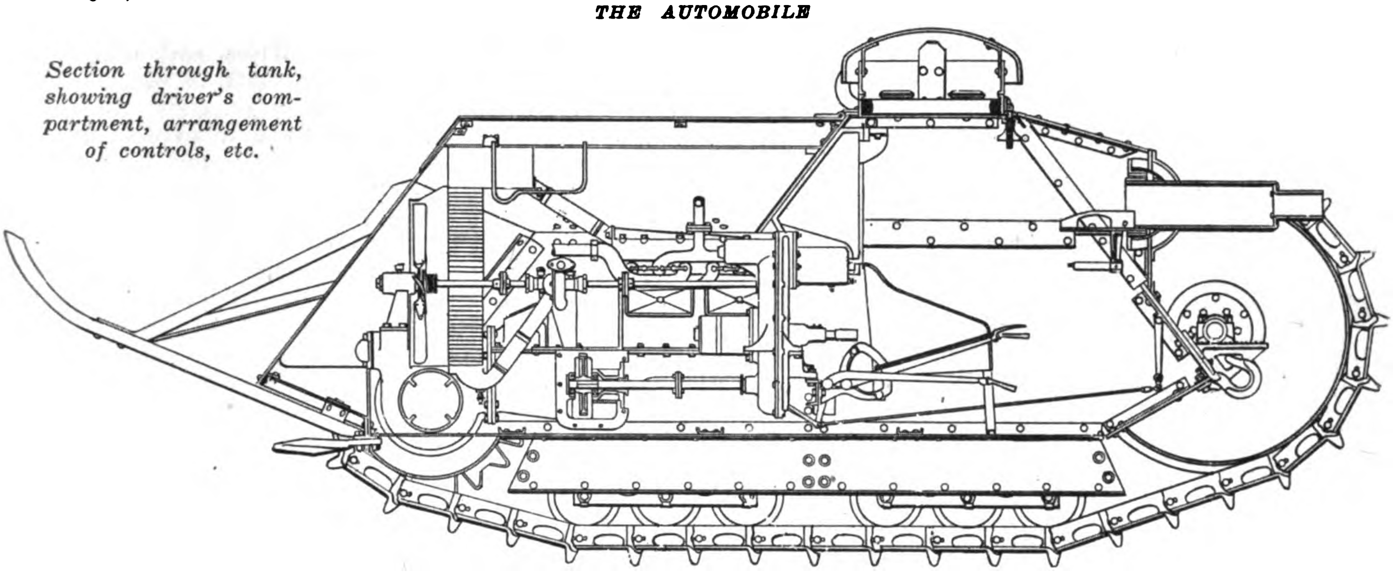
The piston pins are solidly clamped in the upper end of the connecting-rods, and oscillate within the bushings in the piston bosses. The piston pin is made of steel tubing, ground to size and case-hardened, and is ¾ in. in diameter.

The connecting-rods are of H-section, and measure 9.25 in. from center to center. The material is vanadium steel, drop forged. The large end of the connecting-rod has a poured babbitt bearing. The bearing cap is retained by two bolts with castellated nuts and cotter pins. Adjustment for wear can be made by filing off the sides of the bearing cap.



Sketch showing interconnection of engines and drive to rear axle

Section through tank, showing driver's compartment, arrangement of controls, etc.



The crankshaft is a drop forging, and is mounted in three babbitt bearings. The rear end is flanged to receive the flywheel, which is secured thereto by four cap screws. The front end of the crankshaft is key-seated for a Woodruff key, securing the crankshaft gear. Two oppositely located dowel pins in the flywheel mounting flange prevent the shearing of the flywheel cap screws. The flywheel also serves as the magneto magnet assembly support.

The crankcase is a one-piece aluminum casting. There is a passageway between the two crankcases at the flywheel end, which houses the idler gear between the two engines. A web cast in the left crankcase (looking from the flywheel end) prevents the idler gear (which turns clockwise) from pumping the oil out of the right-hand crankcase. Behind the idler gear is an unobstructed channel which serves to maintain an equal oil level in both crankcases.

The halves of the housing for the flywheel idler are held together by seven bolts with cotter-pinned, castellated nuts, six of these being accessible from the outside of the case, while one of the nuts is inside, directly over the gear. In addition, a cap plate, secured by six cap screws, locks the two crankcases together at the rear. The front ends of the two cases are secured in alignment by the aluminum housing for the train of gears that furnish power for the fan, water pump, generator and starter drive, and also by four bolts to the U-beam carrying the control assembly.

Camshaft Bearings

The camshaft has three bearings, all different in kind. The rear one is bronze-bushed, the center one of cast iron, unlined, and the front one babbitted. In assembling the rear bearing is pressed into position and reamed. The front and center bearings are reamed to size and placed on the camshaft before the latter is inserted. Two set screws screwed into the block from the outside hold the front and center bearings from revolving.

There are three manifolds, two exhaust and one inlet. The inlet manifold is cast in three sections, the center section serving as a support for the carbureter and connecting same to the other two sections which are mounted on the respective cylinder blocks.

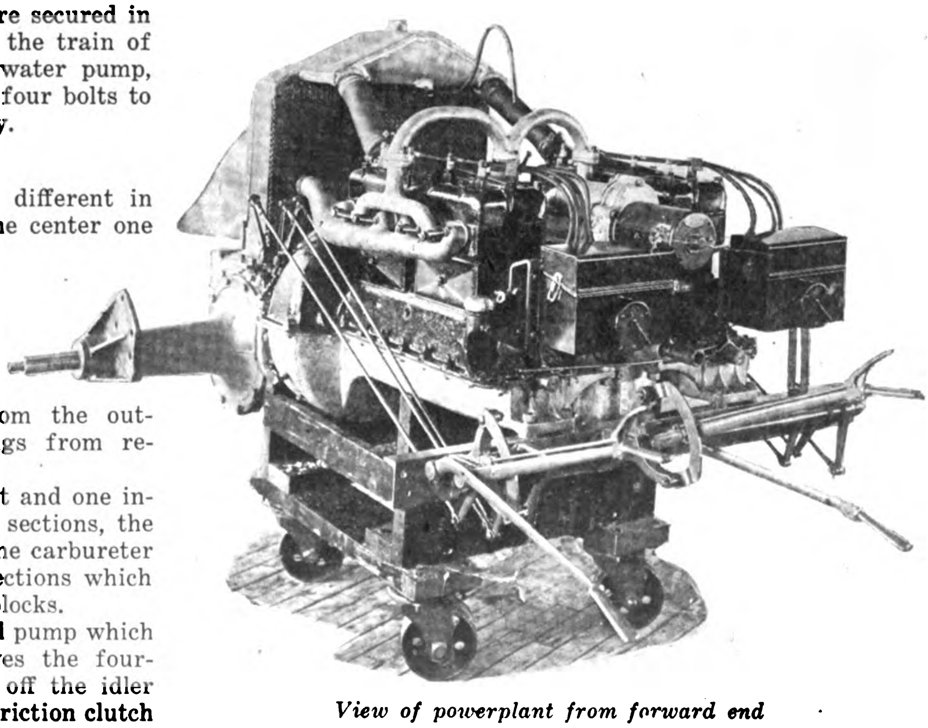
The water is circulated by a centrifugal pump which is driven by the same shaft that drives the four-bladed fan, from the gear train driven off the idler gear. As in all positively driven fans, a friction clutch is inserted in the drive to prevent injury to the fan by sudden fluctuations in engine speed. The fan is lubricated by means of a grease cup mounted on the bearing at the extreme end of the shaft. This cup must be turned down daily.

Radiator

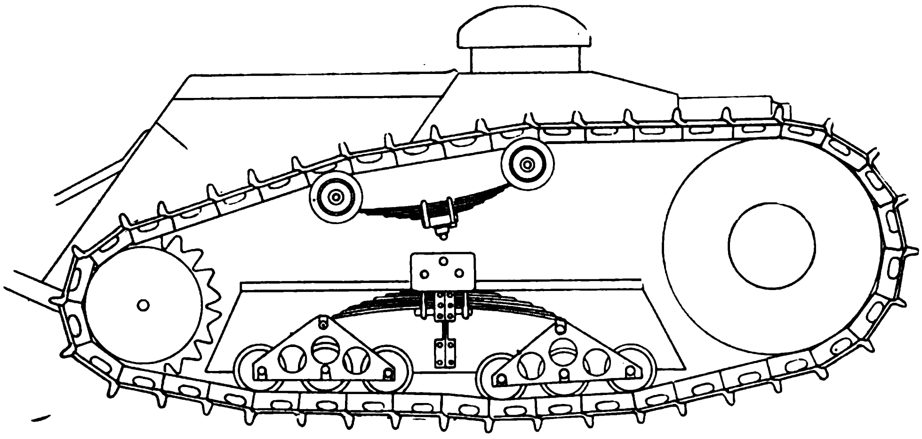
The radiator is a specially built honeycomb type, and is mounted at the rear of the tractor. The fan is located on the side of the radiator, and away from the engines, there being a cored passage through the center of the radiator through which the fan shaft extends. The radiator is mounted upon the rear axle housing, which has fins bolted to it that act as supports. The air for cooling is drawn upward from the lower rear part of the tractor body through a screen, and a housing surrounding the fan is so constructed as to aid in deflecting the air through the radiator core.

Fuel System

The main fuel supply tank is mounted in the top of the body, just back of and above the driver's seat. From this tank, which has a capacity of 15 gal., the fuel flows



View of powerplant from forward end



Side view of tank, showing spring mounting

by gravity to the carbureter. The fuel tank is of galvanized steel and is protected by armor plate. Between the armor plate and the tank proper there is a felt lining. The armor plate is spot welded together, being made up of several pieces to fit the irregular shape of the tank, which conforms to the outline of the interior of the tractor. The tank and its armor are a unit, which is mounted by two brackets on the armor-plate body. A Donaldson air cleaner is employed.

The 3-ton tractor magneto is of special design, although similar to the regular Ford type. Its magnets are fastened to the flywheel, and the stationary field coils are attached to the cylinder block.

The two 3-ton tractor clutches are of the multiple steel disk type, operating in oil. The interior of the brake drum serves as a support and housing for the steel disks, of which there are twenty-five, twelve driving and thirteen driven.

On the transmission gear shaft is keyed the transmission clutch disk drum, which is machined to receive the lugs of the small or driving disks. The interior of the brake drum is machined to admit the large or driven disks.

The 3-ton tractor final drive is composed of two distinct worm drives, each operating its own axle shaft, to which is attached the drive sprocket. The worm gears are of bronze and are bolted to a steel spider which is supported by the axle shafts, which are carried by roller bearings revolving within a steel sleeve at the outer and inner ends of the axle housing.

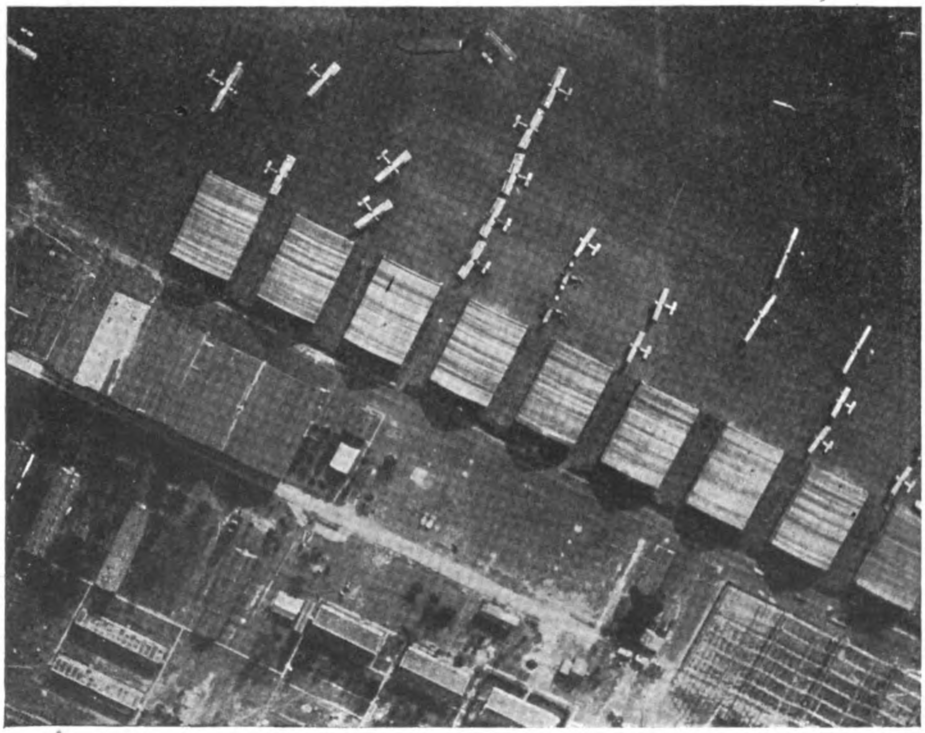
The worm is assembled with 0.010 to 0.015 in. end play and the bearings of the worm must not exceed 1.499 in. nor be less than 1.493 in. Axle shaft bearings should not exceed 1.623 in. nor be less than 1.615. The ratio of the final drive to the engine is 7¼ to 1.

The tracks of the 3-ton tractor form an endless steel roadway over which the tractor travels. They are composed of cast-steel links held together by steel pins. The track pin is held in place by a track-pin keeper—a steel pin similar to the ordinary cotter pin, only larger.

The weight of each track is 390 lb., and the length, when spread out, is 320 in., there being forty links to each track and each link being 8 in. in width.

Standardizing German Engineering Products

THE movement for standardizing German engineering products is making steady progress. Recently at Vienna, at the instigation of the Society of Engineers and the Ministers of War and Public Works, a committee was formed to carry out the proposed regulations in the several branches of engineering. The sub-committees appointed to deal with tools, screws, pipes, ball-bearings, bolts, and gear teeth have held numerous meetings, and have reached conclusions with regard to those objects of engineering manufacture. Locomotive construction is now under consideration. The scope of the standardizing movement is being extended to canal structures and to shipbuilding. The advantages of an all-round standardizing of engineering products have been made impressively evident by the war conditions through which European industries have passed.



American Flying Field in France

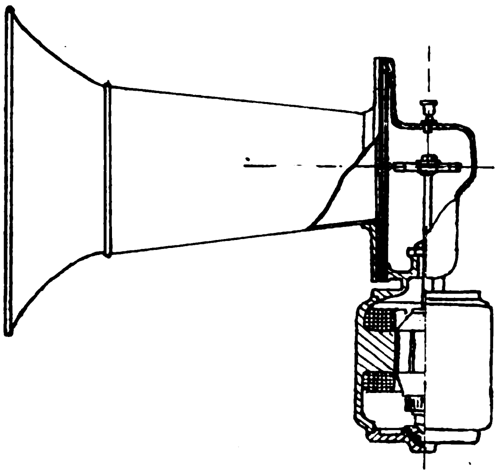
A most unusual and striking aerial picture taken in the Argonne forest just previous to the armistice. It shows a large American aviation camp with machines ready to fly. This picture has naturally been held up by the French and U. S. censors and was released only recently

Electrical and Mechanical Warning Signals for Automobiles

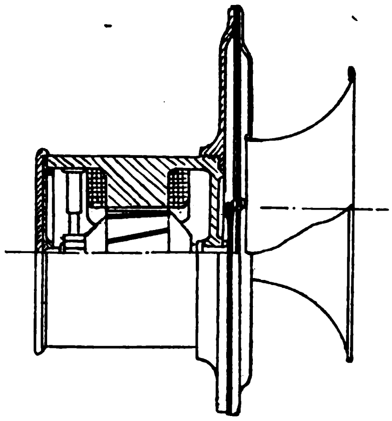
Principles Involved in the Operation of Diaphragm Signals—Relative Advantages of the Electric Motor Horn, the Electric Vibrator Horn and the Hand Operated Horn—Variety in Mechanism of Hand Horns

By Fred I. Hofman

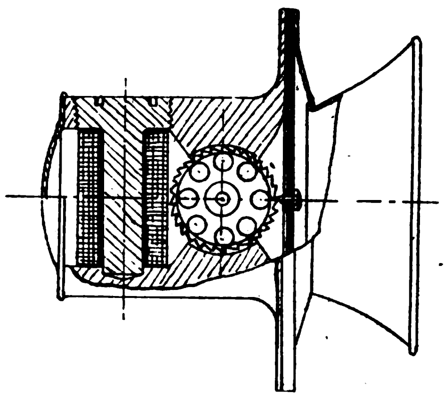
THE number of warning and signalling devices indicating the approach of vehicles driven by motive power has greatly increased in the last few years, and though the electrically operated instrument is the predominant one at the present time, still there are a few designs actuated by manual power. The reason why electrical devices are favored lies probably in the simplicity of their operation, for the actuation involves merely the pressing of a button switch on the steering wheel or some place near it. The greater attention required by this type of horn brought, however, a mechanical contrivance on the market with sound-producing qualities not unlike those of its electrical rival, and, considering both price and neatness, it certainly has become a very strong competitor to it. The popularity of the former pattern is no doubt due to the very excellent construction of the small driving motors used in the one class of electrically driven signals and the well-made magnetic vibrator parts embodied in the second. The current for operating same is now easily obtainable from every automobile, and this combined with its steadiness is probably another reason for its popularity. Taking, however, all at its face value, the real advantage is that one is able to alter the duration of the sound at will, and this so far cannot be said of any other mechanically worked horn.



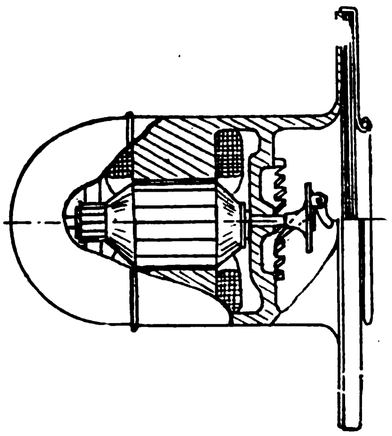
Horizontal ratchet wheel



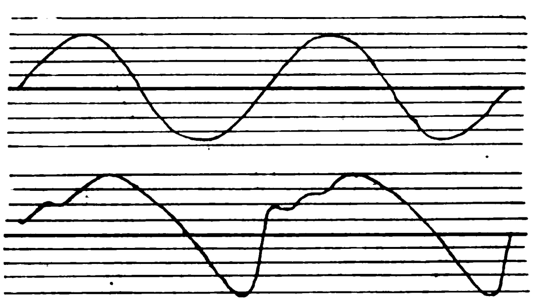
Vertical ratchet wheel



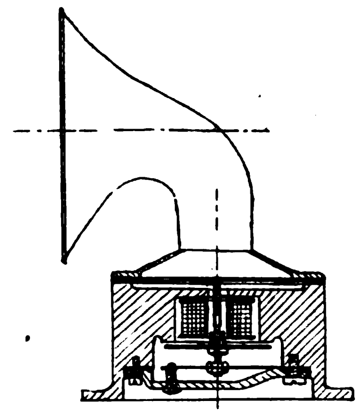
Armature periphery ratchet



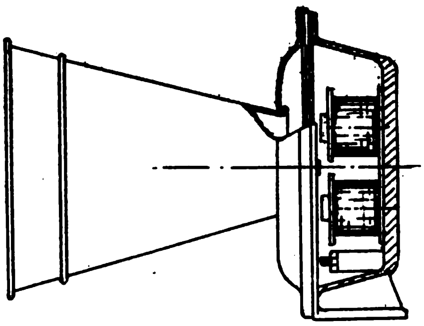
Stationary ratchet, indirect actuating hammer



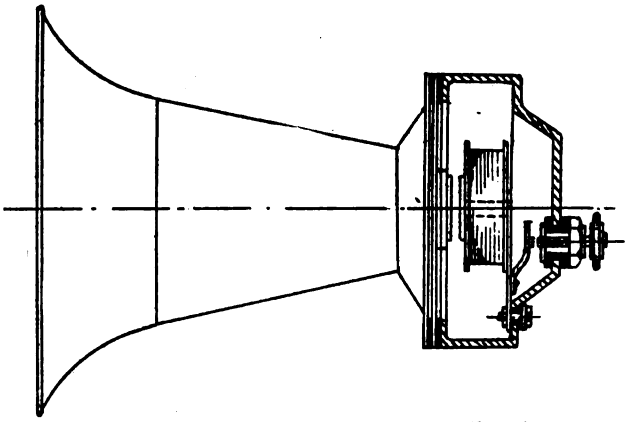
Above: Harmonic note, curve of tuning fork. Below: Curve of vibrator horn, showing chattering or contact blade and sudden acceleration due to magnetic pull



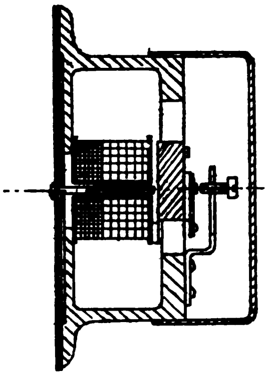
Single casting solenoid vibrator horn



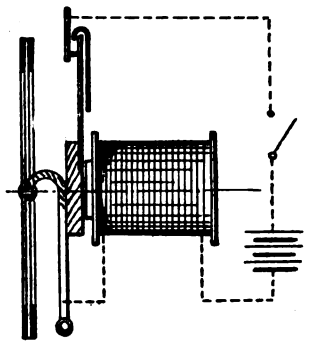
Type of horn with combined armature and diaphragm



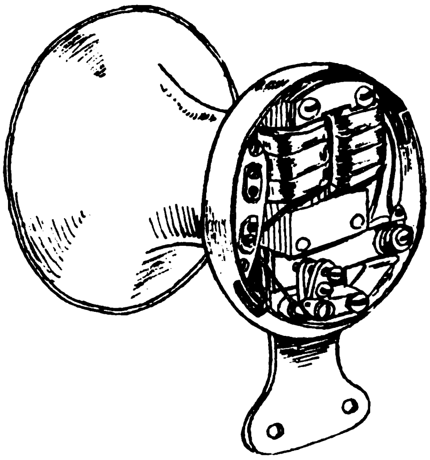
Type of horn with suspended and vibrating magnet



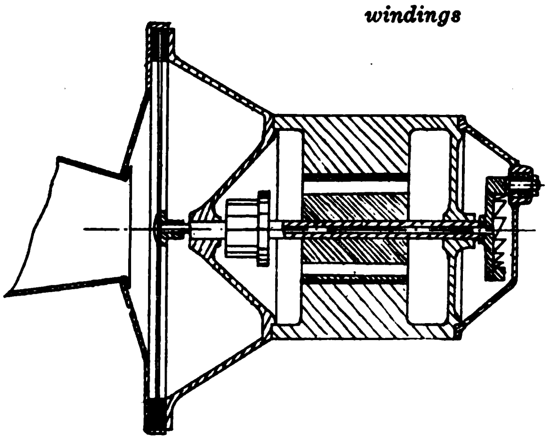
Double-tone, otherwise standard design vibrator horn. Note the two windings



Type having swivel and attached armature



Transformer-coil-shaped vibrator pattern

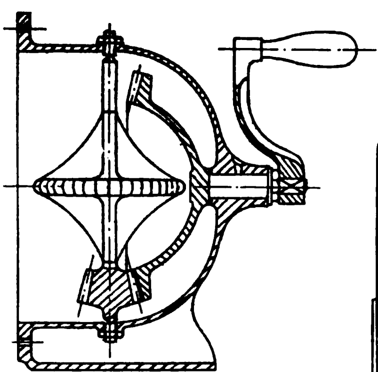


Motor horn giving warning note similar to that of vibrator horn

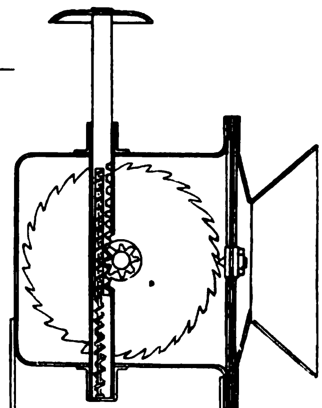
Warning signals of the electrical type can be subdivided into those that produce vibrations of the diaphragms (a) by a deflecting knock and (b) by a direct oscillatory movement similar to that of a hammer blow. The first named designs are the motor-driven variety and are all alike as regards the main principles involved. They comprise a small motor which is always series-wound on account of the greater tongue of this type, and sometimes works in a field with one or two coils and at other times in a field with permanent magnets similar to those of a magneto. The electromagnet pattern is, however, preferred, as it makes it possible to have a practically closed field case of so-called "ironclad" form and thus save a separate frame or supporting body, which the latter type requires. The armatures of these small motors are built up with from 3 to 12 sections or coils. The spindles run in ball bearings or have hardened and pointed ends revolving on recessed and adjustable screws. The sound actuating part consists in most patterns of a ratchet-like wheel which is fitted on one end of the spindle, or direct on the armature surface. There is, however, one make which is designed to transmit the knocks indirectly through a small governor-like weight agitated by a stationary ratchet.

The principle on which the ordinary electric or vibrating pattern horn is based is the same as that of the familiar electric house bell. The constructions differ only in the manner in which the magnetic systems are arranged. The coils are fixed or suspended and may be either single or double. Only the cheapest grades are built with a cast-iron solenoid. Most of the makes employ a continuous coil winding, but there are in one or two designs circuits with different resistances, so as to break the note and thereby enable the pitch to be altered. The oscillation of the discs is obtained also through quite a number of methods other than those specified above, and some of these are shown in the accompanying sections.

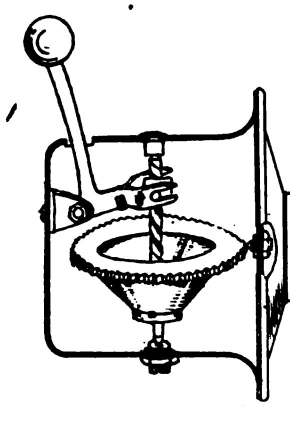
Every maker pins his faith on his own design, claiming it to be the best on the market. Volume of sound, current consumption, simplicity, efficiency and dur-



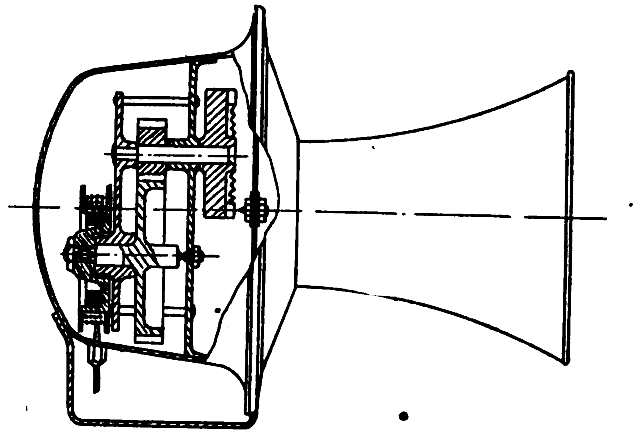
This mechanical horn employs no freewheel clutch and can be moved both ways, left and right. The sound can be prolonged at will of operator. Note the pivot bearings of the wheel shaft



The plunger when depressed sets the small gear and ratchet in motion, and consequently the toothed flywheel, which in its turn knocks on the anvil of the diaphragm



This design contains no gears. The bell crank when moved forward by the operator acts through a pawl clutch on a screw collar on a vertical rod having a very steep thread. The actuator, being solid with the screw, moves direct



The impetus given to the serrated driver wheel is obtained by the pull of a spring-operated pulley and cable, and through a double gearing. The spring is of the clock type and located inside the pulley for the cable

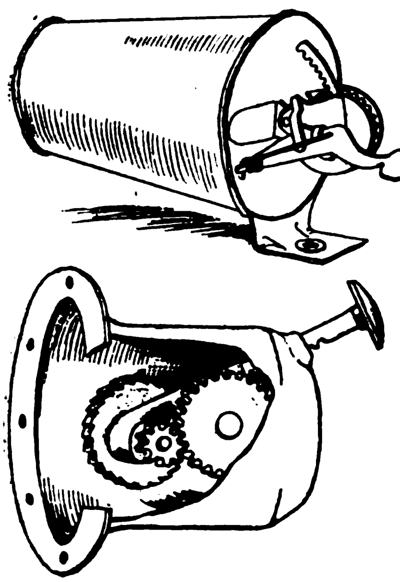
ability are factors for consideration when judging the value of the separate designs.

It is well known that one of the major troubles in connection with motor driven horns is the brushgear and in the vibratory magnetic pattern the pitting and sparking of the contact points. Brush trouble is difficult to entirely overcome, whereas sparking of the blades in the vibrator type can easily be remedied by shunting across a candenser. So far sparking has been obliterated by this method in only a few makes.

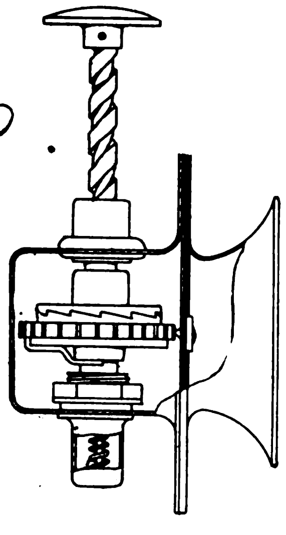
There exists still another pattern of horn, and that is the type in which the vibrator points against the diaphragm are oscillated by a motor. This, therefore, makes use of both the principles in question.

The diaphragms of most warning signals consist of hardened steel plate, often heat treated or also hammered to give stability, 4-5 in. in diameter and fitted with a cork or thick paper ring on the periphery in order to insulate it from the instrument box on one side and the conically shaped metallic projector trumpet on the other. A resilient partition layer is made use of so as not to impede or deaden the resonant sound by a direct contact with the steel surface of the body proper. The thickness of the diaphragm varies from one to two hundredths of an inch and is greater for hand than for electric horns. The note produced by the blows is dependent upon the relative thickness of the disc as compared with its diameter. The thicker the metal the higher the pitch; or with a given thickness of metal, the smaller the diameter of the diaphragm, the higher the pitch produced. With the stiffer diaphragm, however, the horn is rather more likely to become inoperative through sticking, and this should be taken into consideration when a tendency to produce a higher tone than normal is observed.

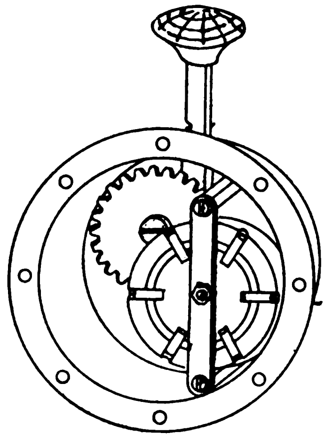
The purely mechanical type of horn, being perfectly enclosed, not prone to get out of order and easily adjusted from outside by simply advancing the anvil on the diaphragm, is very seldom interfered with or opened. To the man in the street, this design looks more like a box of tricks than any other instrument on the automobile and it should be worth while to describe the different constructions and details employed



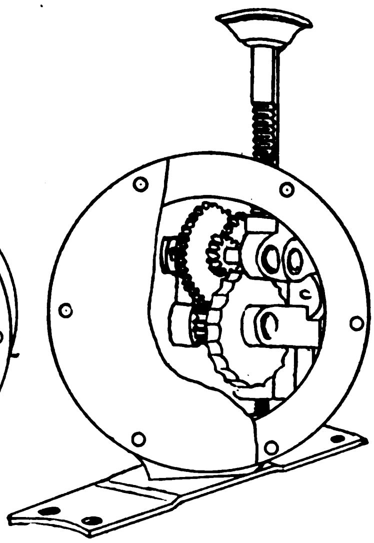
Above: The press-down lever, to which is attached a rack, engages with a pinion on the gear. Below: The mechanism in this type contains a double speeding-up gearset and circular plunger cut on one side with teeth



The threaded handle of this horn engages a ratchet clutch, and when pressed down turns the special tooth rotator, which displaces the sounding shield



In this horn, which embodies also a double train of wheels, the sounding is produced by small hardened rollers



This road clearer is the only design using a triple set of gears. The final speed of the flywheel being very great, gives a long sound

for obtaining the warning sound. It may be mentioned that in general the note is practically the same on all horns and never differs to a great extent.

The movement of the inner sound producing mechanism of these horns is brought into action in different ways by a vertical, oblique, horizontal or rotary thrust from outside. The pressure exerted on the plunger or lever of some construction is then transmitted either directly through a train of gearing to a disc. This disc, with its hardened and ground teeth, is knocking continuously on the hardened pin of the diaphragm while in motion. The gears used in the horns are of 32 or 24 diametral pitch and of steel. The spindles are of the plain pattern running on hardened steel brushes, less often on centers. Those designs using a geared-up movement have the whole of it fitted in a die-cast frame, whereas the single designs often make use of the steel outer casing as bearing support. The speeded up pattern horn is, of course, a more rugged and reliable job, but the one gear type is simpler, less liable to get out of order and cheaper to manufacture.

The amount of ingenuity displayed by the manufacturers in producing warning signals of both the electrical and mechanical type is astonishing and this will be best appreciated by studying the constructions of some of the leading and best advertised makes fully described in this article.

Four-Inch Guns Mounted on Motor Truck

By W. F. Bradley

THE biggest gun carried on and fired from an automobile chassis is an Italian weapon built by the Ansaldo company on a special truck chassis manufactured by the S. P. A. Co., Turin, Italy. This automobile gun was brought out soon after Italy entered the war, and has been made use of with very satisfactory results throughout the operations against Austria.

The gun is of 102 mm. bore (practically 4 in.) and fires 17 rounds a minute, with a range of 11 miles. The chassis follows standard lines of construction, and except for heavier frame members and a set of quick-acting jacks does not differ very much from the ordinary 4-ton truck built by the S. P. A. company.

The motor is a four-cylinder monobloc casting of 100 by 200 mm. (3.9 by 7.8 in.) bore and stroke. In accordance with the usual S. P. A. design, the water pump is inside the cylinder casting, instead of being a separate housing. As the cylinders have both an intake and exhaust manifold cast integrally, with valve stems inclosed, the appearance is remarkably clean. The drive is taken through a disk clutch, a four speed and reverse transmission, with final drive by side chains in metal housings. The wheels are cast steel, shod with single and dual solid rubber tires of Goodrich make.

The gun is mounted on the truck platform, back of the driver's seat, and when not in use is carried with its muzzle pointing forward between the driver and the mechanic. As the barrel of the gun is of considerable length, its mouth is practically flush with the radiator cap.

Being mounted on a pivoted platform permanently attached to the chassis, the gun can be swung in any direction when going into action, and is only placed in the pointing forward position when on the road. This position, incidentally, gives the best distribution of weight.

Under the frame members of the chassis are two quick-acting screw jacks, which are made use of to raise the chassis so that all load is taken off the springs when the gun goes into action.

Protection is provided for the motor by means of 8 mm. chrome nickel steel armor plating in the form of a hood. Ample louvres are provided on front and side to assure a cooling draft of air. There is a gunner's shield, but no protection for the drivers. The vehicle is practically fireproof, for no wood whatsoever is used in its construction; the dashboard is metal and the wheels, as already stated, are cast steel. The gasoline tank is under pressure, so that in case of its being punctured or the line broken the fuel cannot flow to the exhaust pipe or other hot parts of the car.

The 102 mm. automobile artillery is formed into batteries with four guns to a battery, the whole being served by automobile transportation. In addition to the four gun cars there are twenty other vehicles, comprising telephone and signal car, mechanical workshop, and munition cars, all of them being of the one type. The commanding officer has a car and is attended by two motorcycle dispatch riders.

The entire battery of four guns and 20 supply cars is automobile mounted, and the automobiles are all of one type. This simplifies the work of maintenance and enormously reduces the quantity of spare parts to be carried. Every car in the battery has armor plated hoods, and in addition the ammunition cars have armor plated bodies. Each ammunition car carries the two drivers and four men seated on a broad seat at the rear.

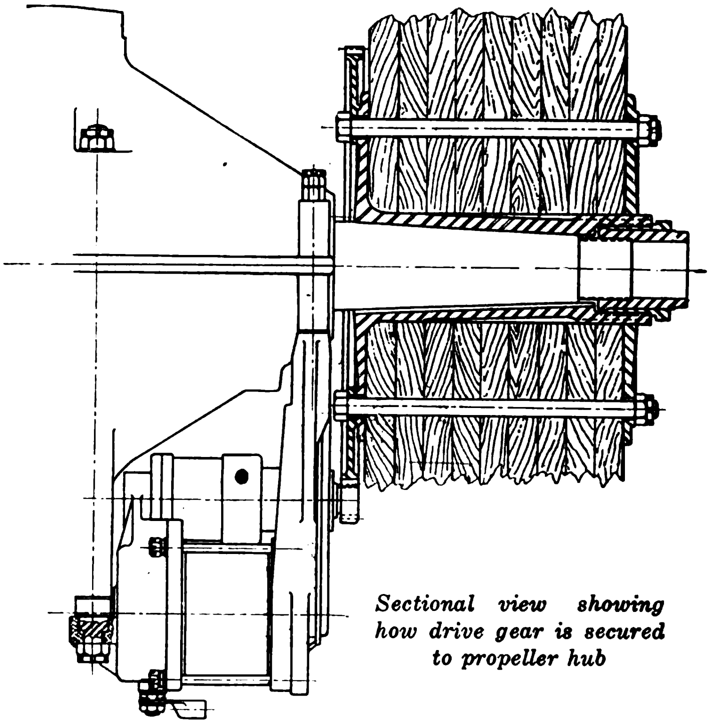
Bijur Starters for Seaplanes and Blimps

Fitted to Liberty Engines at Propeller End and Crank Engine Through a Double Reduction Gear with Bijur Automatic Screw Shift

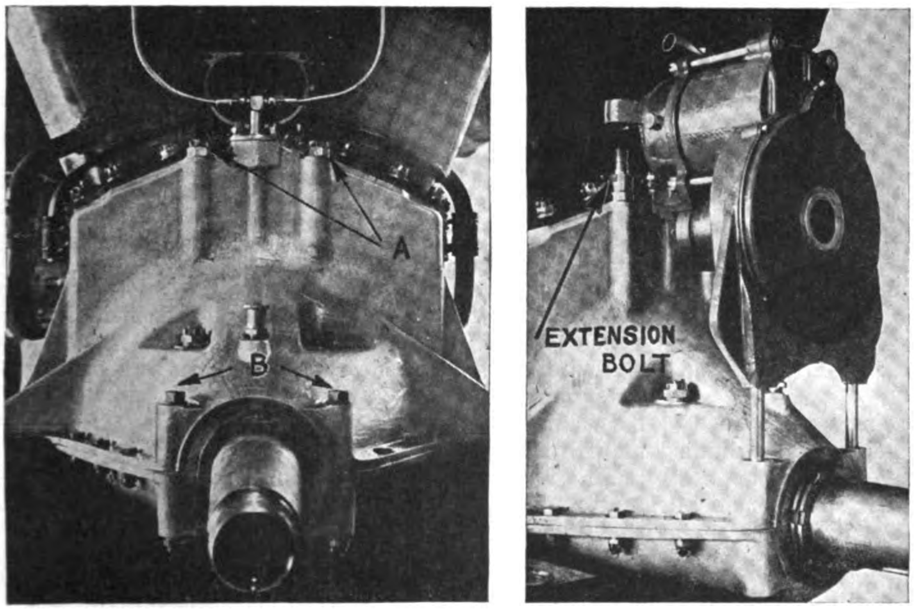
AMONG the war-time developments in the automotive field regarding which nothing has hitherto been published are the electric starters built by the Bijur Motor Appliance Company for the Liberty and other aeronautical engines, and supplied in some quantity to the Navy. Until recently there has been a federal injunction in force prohibiting the disclosure of this device without permission of the Secretary of War or of the Navy, but this has lately been vacated.

As will be noted from the accompanying illustrations, this device embodies several interesting features. The mechanism consists of a relatively small electric motor, of special design, fitted with a double gear reduction and a special form of the Bijur automatic shift. This mounts directly on the crankcase at the propeller end of the production Liberty engine, without the use of intermediate brackets and without making necessary any alteration to the engine. To mount the Bijur starter on the Liberty engine, two nuts at the base of the cylinders nearest the propeller end (marked A in illustration) are removed and special extension studs are screwed on. Two lugs on the starting motor casing fit over these and are retained by the original engine nuts, which are put on the extension studs. The two end bearing bolts at the extreme propeller end of the engine crankcase (marked B in illustration) are removed and are replaced by two long studs which project from the starter housing.



Sectional view showing how drive gear is secured to propeller hub

Normally there is no connection between the starting motor and the crankshaft. A gear ring is placed inside the propeller hub flange and held by the regular propeller bolts passing through holes jig-drilled for the purpose. The pinion of the starting motor is normally retained within the housing. When the starting switch is depressed the pinion meshes with the teeth of the gear ring and cranks the engine. The starting of the engine under its own power automatically unmeshes the pinion. Provision is made against the possibility of the teeth jamming, and they will not mesh with the gear ring if the switch is depressed while the engine is running. The use of an eight-tooth pinion is something of an innovation and makes possible a high gear reduction.



Bijur starter mounted on Liberty aircraft engine

The Bijur Liberty starter was originally designed for the Navy for use especially on seaplanes. At the suggestion of the Airplane Engineering Department of the Signal Corps the design was made such as to obtain a starter of minimum weight and current consumption combined with a maximum of cranking power. It was thought that this requirement would, of necessity, entail cutting down the cranking speed to a very low value, but this was found not to be the case. The success of the design as produced will be evident from the following data:

Weight of starting motor, 20.5 lb.

Normal cranking current, 100 amp. (12-volt battery).

Maximum torque available on engine crankshaft, 1300 lb.-ft.

Normal cranking speed (crankshaft), 40-50 r.p.m.

The reason for choosing the propeller end of the engine on which to apply the starter was that it makes possible the use of a simple and sturdy form of drive without clutches or couplings. It also makes use of space not available for other purposes.

Organization and Work of the Motor Transport Corps

¶ In Complete Control of All Vehicles Used by the A. E. F.—Maintenance Problems Aggravated by Number of Different Makes—Had to Provide 3000 Parts for Each New Vehicle Put in Service—Trucks Delivered Overland an Average of 380 Miles.

By W. F. Bradley
AUTOMOTIVE INDUSTRIES' *European Correspondent*

HAD America been a professional fighting nation, with every detail of its army organization perfected in theory and in practice, the task of providing automobile transportation for an expeditionary force of more than 2,000,000 men would have been a man-sized job.

But when Uncle Sam rolled up his sleeves his entire knowledge of automobile transportation under war conditions had been gained on the Mexican border and from very meagre official reports from Europe. The very little motor transportation he possessed was in the hands of the Quartermaster Corps and was altogether inadequate for a great European war.

When that steady stream of traffic began to flow across the Atlantic every individual organization fought for shipping space, and the most powerful got it. The automobile service being technically non-combatant and influentially weak, got squeezed out until the more powerful army organizations in France began to realize that by leaving the automobile service in the rear they had been abandoning their most valuable ally.

Thus, while automobile men in America were laying wonderful plans for standardized trucks, the automobile men in France were scouring the country for anything which had wheels and burned gasoline. They found these cars and trucks in France, in Italy, in England, in Spain, and even got some "orphans" born in Germany and Holland.

So, while it can be considered a man-size job to run an automobile service for a two-and-a-half-million army, when the organization is perfect and the supplies are regular, it has to be admitted that it adds considerably to the complexity of the task when it is necessary to organize a service and run it at the same time, when the main source of supply is 4000 miles away and unprepared, when the lines of communication are open to attack, and when the unsatisfactory expedient of begging vehicles from whatever European factory can furnish them has to be indulged in.

Total Vehicles in Use by the A.E.F. on Dec. 15, 1918*

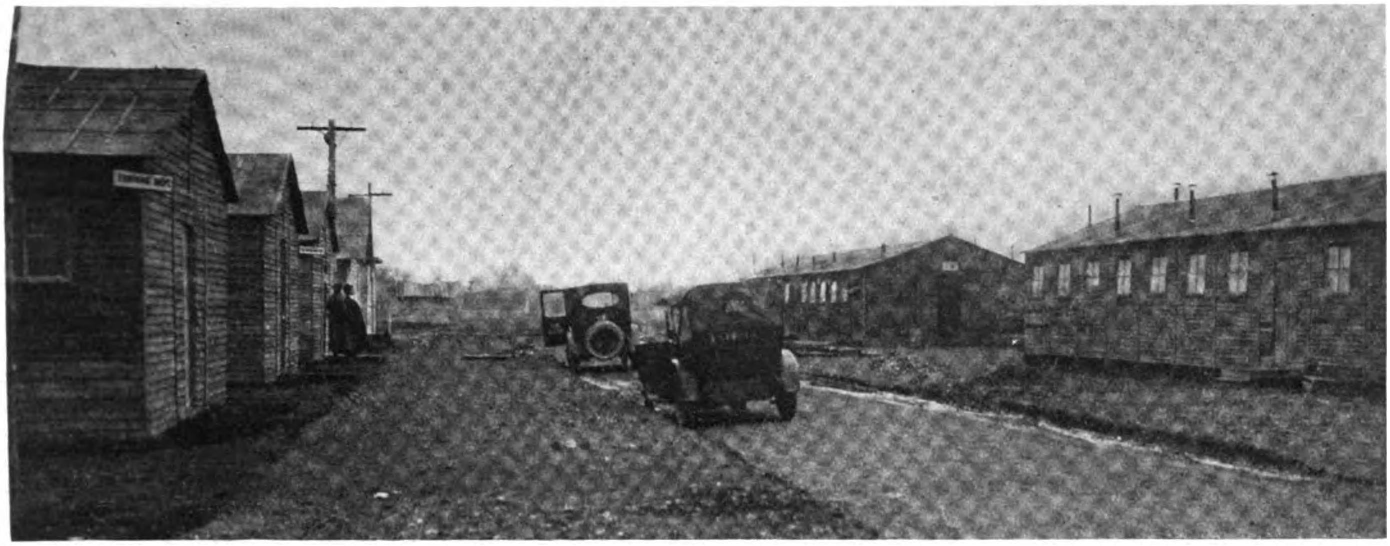
**The figures given in this table were obtained by W. F. Bradley from the Director of Motor Transport Corps, Overseas Division, and are official.*—EDITOR.

It was about a year ago that the army automobile service was taken out of the hands of the Quartermaster and vested in the Motor Transport Service, later, and at present, known as the Motor Transport Corps.

Boiled down and stripped of its legal and military phraseology, the general order which brought this change into effect gave the M. T. C. complete control over all motor vehicles in the Service of Supply of the American Expeditionary Forces and entrusted it with technical supervision over motor transportation in the zone of advance.

The organization is distinctive, differing entirely from that of the French Army and only corresponding in a general sort of way with that of England. The Overseas Division of the Motor Transport Corps has at its head Brigadier-General M. L. Walker, with headquarters of the corps in the town of Tours, less than half way up the main line of communication.

To give an idea of the size and importance of the Motor Transport Corps, it is only necessary to state that it has under its control about 81,000 vehicles, composed of 7575 passenger cars, 32,500 trucks, 18,000 motorcycles, about 4300 trailers and 19,000 bicycles. These, together with the stock of spare parts, tools and machinery which were in hand at the date of the armistice,



This "Western" town was built by the Motor Transport Corps in France. These are barracks and offices for men. One sees such groups of buildings every 5 *or* 6 *miles along the lines of communication*

represent a value of not less than $175,000,000. At the same date, the number of enlisted men in the Motor Transport Corps of the entire A. E. F. was 20,392, and the number of officers, 1032.

The Motor Transport Corps has charge of all the automobile transportation of the American Expeditionary Forces. In the early days, some of the corps had their own transportation. The most conspicuous example was the Aviation Section of the Signal Corps, which got together quite an important fleet of automobiles before the present M. T. C. came into existence.

It was felt that there should be an automobile service for the entire army, and not a separate service for each corps. The pooling of the automobiles met with a considerable amount of criticism, particularly from those services which had got automobile transportation together before the M. T. C. was formed.

This system of pooling is undoubtedly the most economical in the long run, for it simplifies supply and maintenance, and puts vehicles in service just where they are wanted. With divided control one set of vehicles may be idle or only partially employed, while a neighboring set is overworked or so inadequate in numbers that the efficiency of the whole army is impaired.

This system of pooling has been developed to an even greater degree in the French Army than in the American Forces, notwithstanding the fact that the French run a practically independent motor transport corps for aviation and artillery.

The work of the Motor Transport Corps was rendered difficult by reason of conditions for which the nature of the war alone was responsible. Troops and primary necessities were brought over faster than automobiles and automobile supplies, with the result that the first American forces to land in France went out and bought whatever happened to be available.

For any organization whose work was held up for lack of trucks and cars it was the most natural thing in

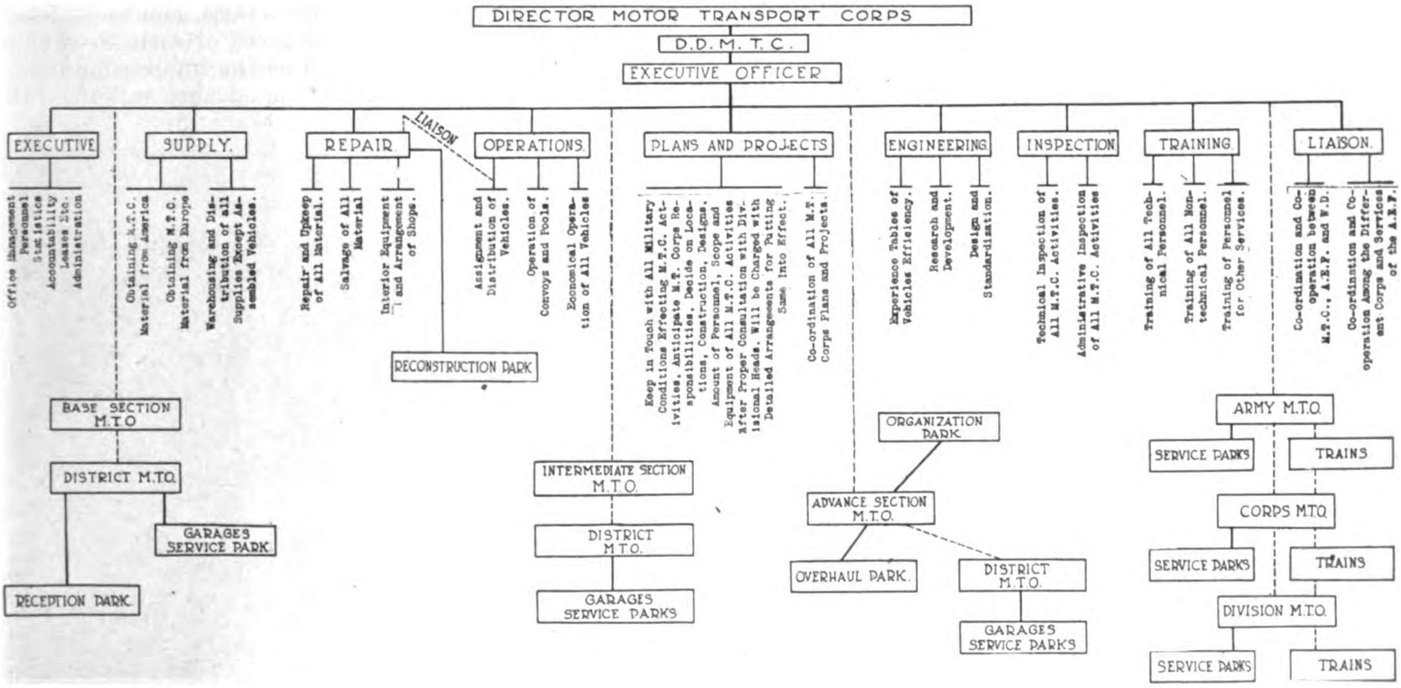


Chart showing the general organization of the Office of the Director of Motor Transport Corps. The solid lines represent direct control; the dotted lines, technical control

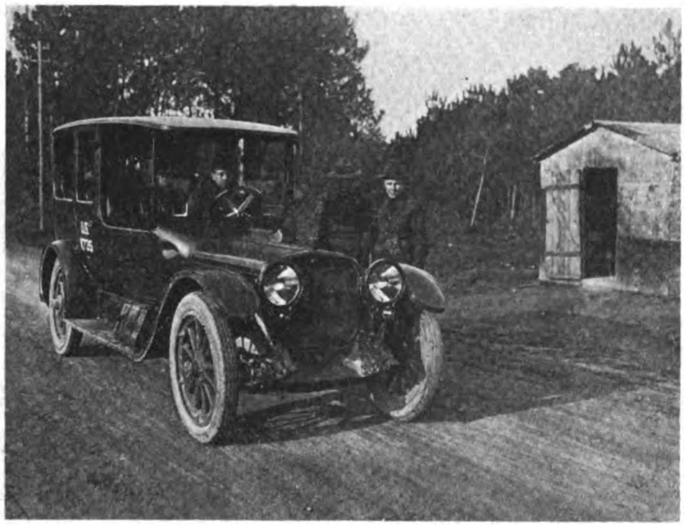


These Army police stop all cars and verify travel orders. At every street corner in the ruined towns and cities in the war zone these military police direct traffic with the same dispatch as at Fifth Avenue and Forty-second Street, New York, or Michigan and Jackson Boulevards, Chicago

the world to buy an urgently needed car without inquiring too closely how supplies were going to be obtained later to keep it in condition. Thus, the army which has made the greatest efforts toward standardization has at the present time fifty-one makes of foreign passenger cars, three makes of American motorcycles and five foreign makes. There are twenty-six different makes of American passenger carrying automobiles, twenty-three makes of 1½-ton trucks, twenty-one makes of 3-ton trucks, six makes of 5-ton trucks, thirty-four makes of American trailers, and at least twenty European makes.

Before some of the "orphans" were salvaged, there were 169 different makes of passenger cars—American and foreign—to be cared for.

Welfare Organizations Own 66 Foreign Makes

Outside organizations, such as the Y. M. C. A., the Salvation Army, K. of C., etc., own sixty-six foreign makes of cars or trucks and twenty-nine different American makes, all of which the Motor Transport Corps has to father. Many of these trucks and cars are altogether unknown to Americans at home and only slightly known to Europeans. This purchase was made under absolute necessity; but their maintenance always will be a very serious problem for the M. T. C.

A variety of types of automobiles is inevitable, no matter how thoroughly the standardization idea is followed. The M. T. C. is responsible for the motor transportation of the army with the exception of kitchen trailers, which belong to the Quartermaster; tanks, which are under the control of the Ordnance Corps, and a very small number of special vehicles for the Air Service.

Originally, some of the branches of the service had their own transportation, the most important of these branch transportation services being that of the Air Service. When they were all grouped under the M. T. C. a list was very carefully prepared of necessary types to cover the needs of the entire army, and although this list assumed that there would be but three makes of passenger cars it totalled 112 different types of cars. trucks and trailers. Later, by close team work, it was possible to reduce this number to rather less than 100 types which were essential to the needs of the army.

It is absolutely impossible to keep stocks of parts of every "orphan" car which gets into the service under dire necessity. But complete stocks are kept for forty-one makes of cars and trucks. This means that there are forty-one different makes of automobiles for which the M. T. C. is prepared to supply at a moment's notice any part liable to need replacement.

This supply organization is immense, for the number of parts listed and always on hand to meet requisitions total 90,000. No other branch of the service has anything like such a huge stock. It is believed that the engineers come second, but their stock of listed live articles is not half that of the M. T. C.

Substitute Parts Cannot Be Offered

Further, the M. T. C. list cannot be reduced nor can substitutes be offered. If the Quartermaster is out of beans, he can recommend rice as being just as good, but the M. T. C. supply officer who receives an urgent requisition for a French Renault crankshaft is unable to put forward a dozen Ford shafts in its stead.

The great cry in the M. T. C. is for standardization, and it is toward this end that they are working. With every new make of car which goes into service the possibility has to be faced of providing 3000 individual parts as replacements. So serious is this problem that M. T. C. supply officers would prefer to have in use one indifferent make of truck rather than an equal number of good trucks produced from six different factories.

Since the critical days when anything and everything on wheels had to be accepted and pressed into service, without any thought as to how long it could be kept running, a very complete system of supply has been evolved, under which every shipment, every package, can be traced from the moment it leaves America to the time it enters the main supply park 4000 miles away.

There were times when a truck or car having failed on account of some minor breakage had to be abandoned for lack of a replacement, and within a few weeks had been picked as clean as ever vultures picked a corpse on the desert. Now parts can be supplied on order; in some cases when they are not available from America, the M. T. C. manufactures them on the spot.

From the American Army standpoint, the whole of France is divided into three main portions. Around the coasts there are a series of base sections, numbered Base Section No. 1, Base Section No. 2, etc. Nearly the whole of the central portion is known as the intermediate section, and further to the east is the advance section, with

This Holt is working in its natural element—mud

German prisoners making roads for the Motor Transport Corps. Every road used by our motor trucks was kept in repair by gangs of workers spending all their time on them. This applies to every road in France

the actual battle front on its outer edge. The Motor Transport Corps receives its trucks and supplies at some or all of the base ports beginning with Marseilles in the south and ending with Havre in the north.

At practically each one of the base sections there is a big reception park at which the trucks and touring cars are received, unboxed, assembled, greased and prepared for the road. Owing to the shortage of railroad freight cars, all automobiles landing in France are sent to the front overland.

There is a single receiving station conveniently placed in the rear of the American armies, to which station all these trucks are delivered, and from which point they are distributed to the forces in the field. At this receiving station there is space available for storing 4000 vehicles, but as the American forces in France have always been far short of authorized motor transportation for the number of troops on hand, it is manifestly impossible to keep a reserve at this station. Urgent demands for motor transportation necessitated that vehicles be assigned as rapidly as they were made ready for issue.

The distance to be covered on these driveaways varies with the port from which a start is made, and averages about 380 miles.

Convoy routes have been mapped out from each port to the central distributing station, gasoline and service stations have been established along these routes, and all the roads have been marked with signs in English. To relieve the railroad shortage as much as possible, useful loads are always carried. Preference is given to M. T. C. stores, which have to be dropped en route or at the destination; but if no M. T. C. supplies are available, any load is picked up for any other corps, and, if necessary, the truck train will go a little distance out of its way in order to deliver these goods.

Truck Trains Always Running

During the whole of the summer of 1918 these truck trains were running from the base ports to the northeast of France without a break. As each one left, a telephonic communication was sent to the headquarters of the M. T. C., and every evening each officer in charge of a truck train telephoned his location to the main office.

In this way the commanding officer had continuous control over all the many truck trains proceeding from the south, the west and the northwest toward that main distributing station just in the rear of the American Army.

Usually, officers and men were engaged continuously on the task of bringing up trucks from the base ports to the front. Immediately one trip was finished they got aboard the train, returned to the port, and set out with another convoy. In some cases, however, where personnel was short and trucks urgently needed, the organizations for which they were intended sent their own men down to the port to bring the truck train up. The fine road system of France made it possible for a wonderfully reliable and efficient organization to be established; without these roads, or with indifferent roads, thousands of tons of freight would have been thrown on a congested railroad system.

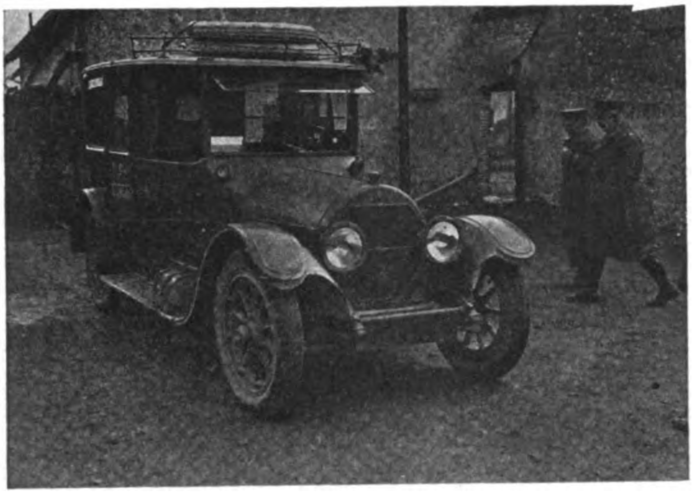
M. T. C. Has Technical Supervision

Under the American Army system, the Motor Transport Corps has technical supervision of all motor vehicles; it is responsible for the procurement, reception, storage and maintenance of all motor vehicles and parts; it has to establish and operate all M. T. C. garages, parks, depots and repairshops; it has charge of the technical training of personnel, and the salvage and evacuation of damaged vehicles. It is responsible for the operation of what are known as Class "A" vehicles—that is, automobiles and trucks used in the S. O. S.—under instructions from the proper commanding officer as to their employment.

When motor vehicles are assigned, in accordance with tables of organization, to such organizations as divisions, corps troops and army troops, they become known as Class "B" vehicles, and the rôle of the M. T. C. with regard to them is limited to technical supervision and maintenance.

At first sight, this would appear to diminish the importance of the Motor Transport Corps. In reality, however, this is not so. Even in the service of supply, where the Motor Transport Corps operates its own vehicles, the M. T. C. officer who controls the vehicles has no authority to determine the use to which they shall be put.

It is his duty to guarantee that the vehicles shall perform as efficiently as possible whatever work the commanding officer chooses to assign to them. When the vehicles are assigned to a combatant unit and moved



General and Colonel entering Cadillac staff car in France. The Cadillac limousine is seen everywhere on the roads behind the American Army in France

from the S. O. S. to the zone of advance, the Motor Transport Corps no longer has to provide the personnel and has no control over the work which these vehicles shall perform.

Full authority is vested in the commanding officer of the division, corps, squadron, group, etc., to use these vehicles on whatever work he may designate. But while having no voice in the tactical use of the motor vehicles, the M. T. C. maintains a very broad technical control; it supplies information on the proper methods of operation, care and maintenance, and has authority to enforce these methods.

Maintenance of First Importance

Maintenance of transportation nearly always comes as an afterthought. The first need is transportation, and after that has been provided necessity compels provision for its maintenance. Scores of examples of this have been found in the history of the American Expeditionary Forces in France.

The first attempt to solve the maintenance problem begins with the operator of the vehicle and the few simple tools placed at his disposal. This soon becomes inadequate, and the next step is to attach to a given number of vehicles a selected mechanic with an increasing number of tools. Then comes the service park, which provides maintenance of a more highly skilled character. The machine shop truck (or trailer) practically corresponds to the service park organization. Next in line comes the overhaul park, and, finally, the reconstruction park, which has as its main purpose the rebuilding, salvage and remanufacture of motor equipment.

The two most important reconstruction parks in France take care respectively of foreign made vehicles and light and heavy aviation trucks, and of all American built automobiles and trucks. This latter park is a huge organization with a staff of about 5000. It receives wrecked material by train load from the front; it undertakes the repair of this material wherever possible, and salvages it when its condition does not warrant rebuilding. The reconstruction park handling foreign built vehicles works on the same general lines, but on a smaller scale.

There is this unsatisfactory feature about the M. T. C. as it is organized in the American Army, that it only gets a vicarious kind of credit for the real work it performs. There are, however, plenty of occasions when the action of motor trucks has contributed largely toward saving the situation.

Trucks Saved Chateau-Thierry

When the German armies made their drive in the direction of Chateau-Thierry, and it looked as if the road to Paris were going to be opened by way of the Marne Valley, an entire division, with all its supplies, was moved from the east to this threatened point by means of motor transportation, and then moved back again when the danger was over. Truck trains carried fresh troops right up into the battle line; a few days later they carried those shattered troops back again; then came up with more fresh troops, thus keeping up such a steady supply of men and material that finally the morale of the enemy was broken.

From the day when the attack was launched on the St. Mihiel salient to the signing of the armistice the automobile service was kept going at full pressure practically day and night, and again contributed in a very important measure to the success of the armies.

The signing of the armistice brought little change in the work of the M. T. C. While there were no munitions to carry, the general supply of food had to be kept up and lines of communications were lengthened. The first few weeks following the cessation of hostilities brought calls for more jam and less hardtack—luxuries were needed where they could be dispensed with during actual fighting—and the M. T. C. had to meet this demand.

So long as an army of occupation remains, the M. T. C. will be kept busy; probably, too, when reconstruction begins an enormous amount of work will be thrown on the Motor Transport Corps. While the American Army remains in France it is intended to give to the men vocational training. The M. T. C. will do its share in this by training men as drivers and skilled mechanics.

Bridge over the Meuse at St. Mihiel used much by the Motor Transport Corps in September, 1918, during the great American drive. The original bridge was destroyed by the Germans. One truck at a time went over this bridge

Determining Gasoline in Natural Gas*

Description of a New Absorption Method Evolved at the Bartlesville Experiment Station

By W. P. Dykema and Roy O. Neal

IN its endeavors to minimize the gasoline losses at absorption and compression plants, which extract gasoline from natural gas, the Bureau of Mines has, through its Bartlesville Experiment Station staff, made a particular study of the apparatus to be used to determine such losses. This paper deals with a method of testing natural gas for gasoline content, which has been found satisfactory in testing rich or lean gases from wells or the residual gas of compression or absorption plants.

The natural gas gasoline industry has had a rapid growth since 1913, when the first absorption gasoline plant was erected for the extraction of gasoline from natural gas, and is now not only being applied successfully to dry gas but also to wet or casing-head gas, still vapors, and residual gas from compression gasoline plants.

According to J. D. Northrop (United States Geological Survey report) in 1917 there were 102 plants using the absorption process in the United States, which had an annual production of 49,017,549 gallons, valued at $9,592,026. This process has been one of the most important developments in the natural gas industry, for it has not only saved and utilized what was formerly wasted, but has helped producers to meet the ever increasing demand for motor fuels.

Tests of Small Samples Unreliable

Tests of small samples of gas by specific gravity determination, change in volume of gas in contact with an absorption medium, or increase in volume of absorption menstruum merely indicate the quantity of gasoline in the gas and often lead to ambiguous results. The only accurate method of determining the gasoline content of gases that contain less than a gallon of gasoline per thousand cubic feet is to allow a given quantity of the gas to come in contact with some absorption medium and to separate the absorbed gasoline from the oil by distillation. The method outlined in this paper is effected by using an absorption apparatus that differs somewhat in design from any previously described, although it embraces the same principle of operation—that of the Friedrick wash bottle. This absorber, designed by the senior writer, has the advantage of being a rigid unit, with a large capacity for oil and consequently a larger gas capacity. By using larger volumes, more representative determinations can be made and the opportunities for error are materially decreased.

Before a plant for recovering gasoline from natural gas is constructed, the quantity and quality of the gas to be used should be thoroughly examined. Often one sees plants that because of the lack of adequate testing of the gas were erected only to be abandoned as complete failures after a short period of operation. At present, there is no excuse for such conditions existing as a result of inadequate preliminary examination of the gas to be treated. Too much emphasis cannot be placed upon the importance of testing gas before the construction of a plant is planned.

The apparatus shown in Fig. 1 consists of a piece of 6-in. casing with five separate compartments, each of which is connected with a ¾-in. gas inlet and also with a 2-in. gas discharge pipe or separate chamber which extends to a point near the bottom of the casing. From the casing runs a ⅜-in. pipe coiled around a 3-in. core with seven turns, through which the gas being treated bubbles and in which most of the absorption takes place. Some small modifications and additions, optional in the design and not shown in the sketch, are the use of needle valves at each extremity of the apparatus in order that gas may not be introduced too rapidly or may be throttled to any desired pressure so as not to carry oil over from one compartment to the next; also the use of a needle valve on the discharge end to enable one to regulate more easily the rate of flow through the meter, especially in tests at low pressures, that is, when the gas flows through the absorber very slowly. It is advantageous to use gate valves instead of drain cocks for drawing off treated absorption oil from the oil chambers, as such valves facilitate rapid work and eliminate the possibility of volatilization losses when oil is allowed to spray through a stopcock under pressure into the container for collecting treated oil. Also time can be saved by using small bull-plugged nipples, in place of standard plugs, as they can be more easily removed and more rigidly connected to prevent leaks.

To make the test with this absorber, 2700 cc. of mineral

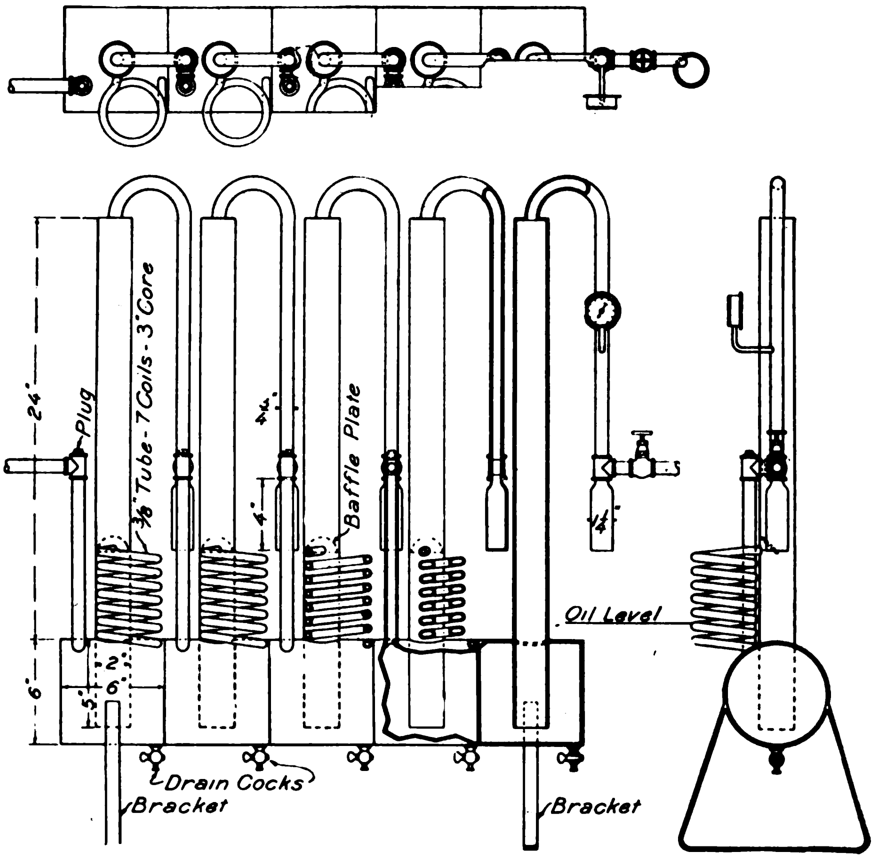


Fig. 1—Apparatus for making absorption test

*Published with the permission of the Director of the Bureau of Mines.

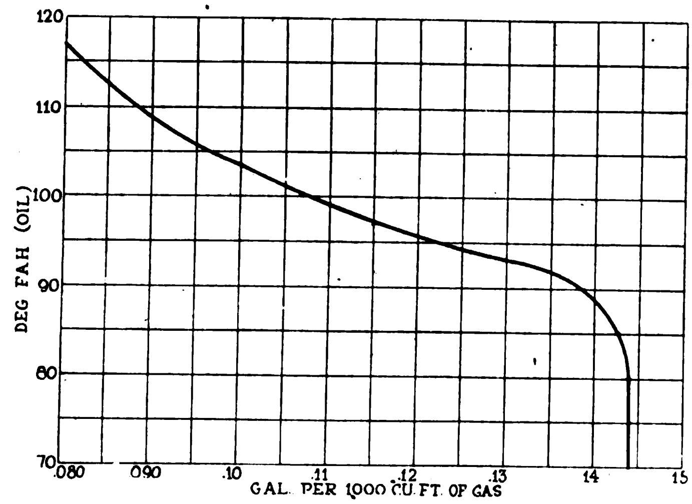

Fig. 2—Effect of temperature of absorbing oil

seal oil, or enough to bring the level of the oil about 2 in. above the top of the 6-in. casing and well above the coil inlet, is accurately measured and introduced into each compartment. The most important requisite for absorption media is high initial boiling point, in order that in the subsequent distillation a quantitative separation can be effected. The oil used in the tests described in this paper had the following physical properties:

Gravity	36.0° Be.
Initial boiling point	450° F.
Viscosity	51 Saybolt
Flash point (Pensky-Martens closed test)	271° F.
Fire test (Pensky-Martens open test)	307° F.

In most tests only the first three absorbers are used, but it may be expedient to fill the fourth compartment when examining rich gases at low pressures or when running a large volume of dry gas in paralleling a 12-hour, or day's, operation of an absorption plant to determine the extraction efficiency. The fifth division is not intended to be used as a container for oil but to serve as a separator or oil trap in case any oil is carried over from the preceding compartment. A meter capable of measuring from 1 to 1000 cu. ft. of gas accurately is connected to the discharge of the absorber.

The gas to be tested is allowed slowly to enter the apparatus with the discharge valve closed, and when pressure equilibrium with the gas to be examined is obtained, or when the desired pressure is attained, the discharge valve is opened enough to permit the desired rate of flow through the meter.

The gas entering the absorber bubbles up through the oil, the latter absorbing the gasoline. The function of the pipe coil is to provide a long and intimate contact between the oil and the gas as the gas passes through the absorber.

After the desired quantity of gas has passed through the absorber the supply is shut off and the pressure is released, through the needle discharge valve, allowing all the gas to flow through the meter. After the pressure has decreased to atmospheric pressure, all of the oil is withdrawn at the bottom of the casing and the oil from each compartment is accurately measured, 1000 c.c. of treated oil from each compartment being kept for distillation.

Distillation of Saturated Oil

Of the treated oil 400 c.c. is introduced into a 500-c.c. Engler distilling flask connected to a condenser made of ½-in. brass tubing and surrounded by cold (ice) water contained in a metal box. The flask is heated by direct fire, slowly at first, and the gasoline driven out of the oil is collected in a graduated cylinder. The flask is heated until the vapor reaches a temperature of 350° F., which usually requires 20 minutes. If the oil has a very high saturation, it is allowed to cool 20° or 30° and again raised to 350°. This procedure is followed until practically no more gasoline is driven over and collected from the condenser.

The extraction of gasoline by the oil will depend upon the rate of flow, gasoline content of the gas, volume of gas treated, pressure and the temperature of the absorbing oil. Optimum conditions as regards volumes of gas and rate of flow with gases at different pressures and gasoline content are given below.

Controlling factors in operation of test absorber:

Maximum rates of flow of gas Cu. ft. per hr.	Pressure Lb. per sq. in.
400	300
200	150
100	75
50	40
20	Atmospheric

Maximum Gas Capacity

Cu. ft. of gas	Gasoline, gal. per 1000 cu. ft.
800	.125
400	.250
200	.50
150	.75
100	1.00
66	1.50
50	2.00
35	3.00
25	4.00

The following data were obtained from a representative test made upon the intake gas at a compression plant in the Mid-Continent field:

TEST No. 2C

Intake Gas

Temperature of oil	94° F.
Pressure	204 lb.
Rate of flow	133 cu. ft. per hr.
Volume	302 cu. ft.

	Compartments 1st	2d	3d
Charge	2600 c.c.	2600	2600
Recovered	2700 c.c.	2660	2630
Gravity of oil	37.0° Be.	36.4	36.0
Distilled	400 c.c.	400	400
Initial C. B.	170° F.	185	308
Gasoline	19.5 c.c.	9.5	3.5
Total each	131.5 c.c.	63.2	23
	217.7 c.c. (78° Be. Gravity)		
Proportion extracted in each compartment	60.5 p. c.	29.0 p. c.	10.5 p. c.
Gasoline content	0.190 gal. per 1000 cu. ft.		

The gasoline content is calculated by using the following formula:

$$Q = \frac{1000}{G} \times \frac{C}{3785}$$

where Q is the gasoline content in gallons per 1000 cubic feet of gas, G is the volume (cubic feet) of gas treated and C is the *total* number of cubic centimeters of gasoline obtained from the treated absorption medium.

Much comment has been given as to the effect of pressure on the recovery of gasoline from natural gas by absorption methods. It has been stated that this is an objection to the use of a portable absorber in field testing, but it has been our experience that the effect of pressure can be entirely eliminated by adjusting the rate of flow of gas and the quantity of oil used in absorbers. In one test (data given) which was made at 17 lb. pressure with rich gas, the results checked up surprisingly close with the plant production (low gravity) plus the gasoline left in the residual gas.

TEST 11P

Intake Gas on High Compression

Pressure	17 lb.
Volume	149 cu. ft.
Temperature of oil	73° F. (av.)

	Compartment 1st	2d	3d
Charge	2600 c.c.	2600	2600
Recovered	3050 c.c.	2820	2650
Gravity (oil)	39.2° Be.	37.8	37.1
Initial B. P.	129° F.	138	162
Distilled	400 c.c.	400	400
Gasoline	48 c.c.	24.4	9.5
Total gasoline each	366 c.c.	172	63
Grand total	601 c.c.		
Proportion extracted in each compartment	60.9 p. c.	28.6 p. c.	10.5 p. c.
Gasoline content	1.07 gal per 1000 cu. ft.		

The temperature, above certain limits, of the absorbing oil has probably more effect on the efficiency of extraction than any other factor. In a series of tests of dry gas with all conditions constant, except the variable factor of temperature, a difference of 43 per cent in the volumetric recovery of gasoline for a gradient of 30° F. was obtained as is shown by the curve in Fig. 2. These changes took place between 90° F. and 120° F. and are undoubtedly due to the rapid increase in the partial vapor pressure of the gasoline fractions in the gas as the boiling points are reached. Probably no two gases will show the same results with the same variation in temperature, inasmuch as the characteristics of the gasoline hydrocarbons are distinctly not similar. The data from which this curve was plotted were obtained from a series of tests using a constant quantity of oil (2600 c.c. of oil in each of the first three compartments), a pressure of 130 pounds per square inch and a total volume of gas of 200 cubic feet which passed through the apparatus at the rate of 2 cu. ft. per min.

The test absorber and the method described in this paper are recommended in preference to the use of those scrubbers mentioned in other publications because they give more significant results when evaluating a gas with the idea of determining the feasibility of installing an absorption gasoline plant, or of ascertaining the efficiency of extraction at absorption or compression gasoline plants.

Emulsion Lubrication of Cutting Tools

ACCORDING to J. A. De Leuw, writing in *American Machinist*, mineral oil does not keep the tool as cool as it should do because of its low specific heat and poor thermal efficiency. It does not always give satisfactory lubrication of the penetrating surfaces, possibly on account of its viscosity. An excessive amount of oil remains attached to the work and shavings.

Where cutting speeds are not too great, an animal oil, such as neats-foot, may be blended with the mineral oil to increase its lubricating qualities.

There are certain classes of work where the cooling of the tools is as important as the lubrication. An aqueous solution is the best lubricant for a hot tool, because it has the greatest specific heat. The point then is, can an aqueous lubricant be made which will actually lubricate the tool?

The lubricating efficiency of emulsions depends upon the action that the suspended oil particles can exert toward reducing the friction on the tool surfaces which come into contact with other metal. As the oil particles in suspension are carried mechanically into contact with the hot tool surfaces some of them must be interposed between the contact parts and thereby produce some lubricating action. The coarser oil particles will be prevented by their size from penetrating as far between the surfaces as the aqueous medium, but the finer particles, which are microscopic in size, will not filter out, but will follow the solution and perform efficient service.

If the compound is diluted in water by means of pressure, using special apparatus and proper temperatures, so that instantaneous solution can take place, then the solvent may be diluted with water without breaking up its combination with the oil, and a diluted solution is obtained which resembles in character the original compound.

The lubricating power of such a solution has been shown to be much greater than if the same material had been broken up into emulsions, and this is explained by the fact that an aqueous solution of oil is in actual existence and the water really has lubricating value.

Natalite Fuel

Editor AUTOMOTIVE INDUSTRIES:

I HAVE before me your journal of July 18 and note on page 121 that you have an article on Natalite. I am pleased to see that your journal is interested in the new fuel, but I must correct certain misstatements in the article under review.

The article states in one paragraph "Although this fuel is not nearly so satisfactory as gasoline or kerosene due to carbonization of the engine," etc.

Now one of the main points in favor of Natalite is the fact that there is far less carbonization when using Natalite. This is a question that has been admitted by scientists and has been fully demonstrated in practice.

In another paragraph of the article it states: "In addition to carbonizing the engine, Natalite does not give as much power as gasoline and kerosene." There is not the slightest doubt that Natalite gives *more power* than petrol. I am inclosing herewith a few reports on Natalite by users who have done a few thousand miles on the new fuel, originals of which are in this office.

I inclose a little book on Natalite, which gives copies of the leading certificates and reports obtained on Natalite. The most important of these are:

The certificate, issued by the Royal Automobile Club of London. This certificate speaks for itself, as the R. A. C. is the leading institution of its kind and is recognized by the bulk of the automobile world. A few points in this certificate worthy of note are:

(a) The engine was an old type.

(b) The weight of the car and passengers was 32½ cwt.

(c) The weather was very wet on the first day, so wet in fact that the cape hood had to be down all day.

(d) The mileage worked out at 16.4 m.p.g.

(e) The engine started easily from cold or when warm.

(f) The valve caps and heads were found to be very clean after the trial.

(g) The distance covered was 501¾ miles.

The outstanding report is that given by the late Professor Vivian B. Lewes. He was one of the leading men in Great Britain on all questions of fuel and was retained by the British Admiralty for this purpose. His report you will find very thorough and very convincing. You will notice on page 15 of the little book that the best result obtainable on "Pratts Perfection," with the carbureter set for the best results on petrol, was 16.9 hp. at 1300 r.p.m., whereas on page 16 you will notice that when the carbureter was set in favor of Natalite the horsepower developed at 1300 r.p.m. was 18.85.

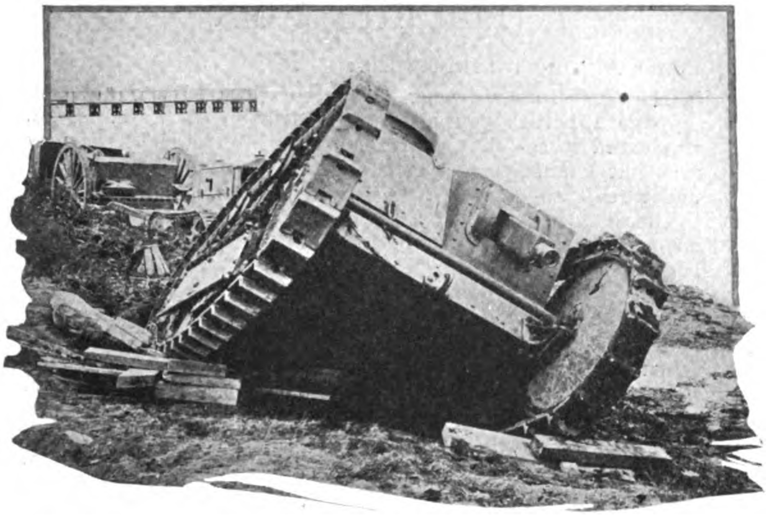
The next report of importance is that contained in the supplement and carried out by Percy L. Weston of Queensland University.

My company is the parent company and own letters patent in most places of the civilized world. We disposed of the manufacturing rights for the Union of South Africa to the Natal Cane By-Products, Ltd., whose shareholders consist of the leading group of sugar growers in Natal. They imported the necessary machinery from France and have now been manufacturing Natalite motor fuel for some months. The capital of the company is £130,000, of which £15,000 is held in reserve. The output of the present factory is, roughly, 1,000,000 Imperial gallons per annum. The shortage of petrol has been so great and the new fuel has given such satisfaction that the demand for "Natalite" is many times the capacity of the factory. The local selling price is between 2/6 and 3/ per Imperial gallon, against petrol at 4/ to 4/6 per Imperial gallon.

Under existing Government regulations Natalite has to be colored with an aniline dye, hence the coloration of the carbureter mentioned in one of the reports.

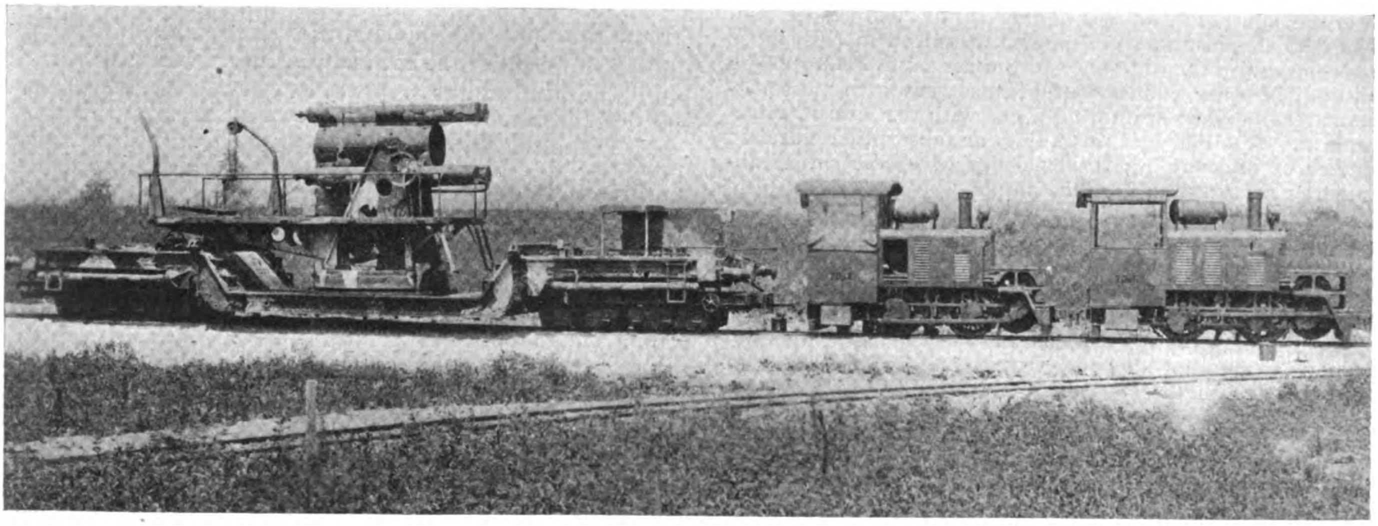
H. A. FINDLEY, Secretary.

[The copies of letters, etc., inclosed are too lengthy to permit of reproducing them here. They contain the statements quoted by Mr. Findley.—EDITOR.]

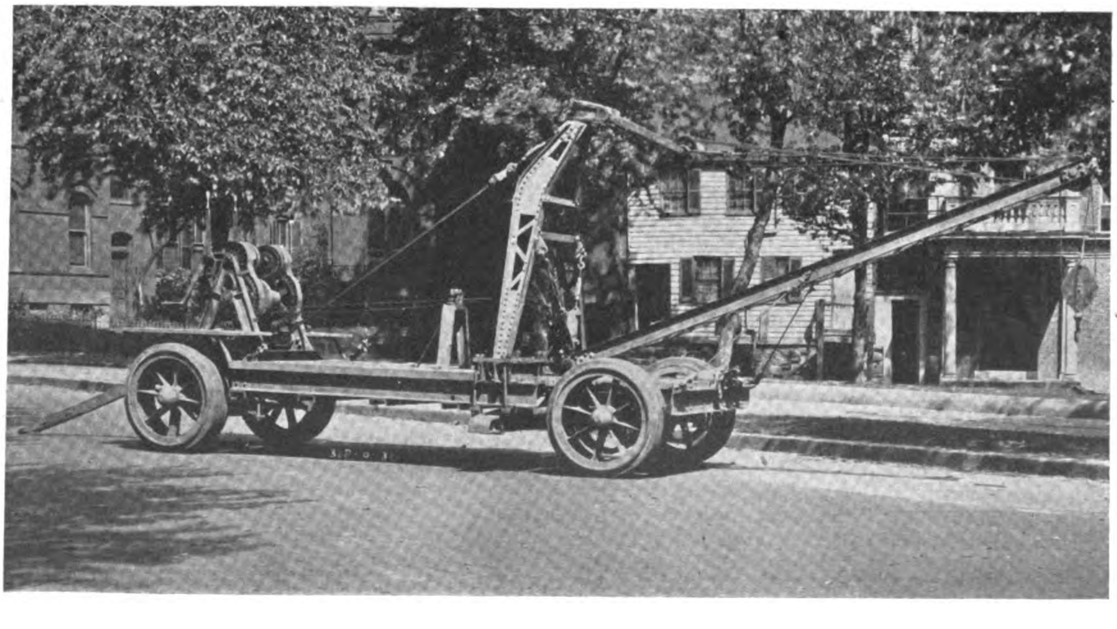


The Ford tank is equipped with two Ford engines. The gunner must sit in the small box from which the gun protrudes. He is huddled compactly in this space. The driver is granted but little more room and must drive the tractor by peering through the slots in the tower—which requires constant craning, as the seat is very low and only a tall man could look through the slots comfortably

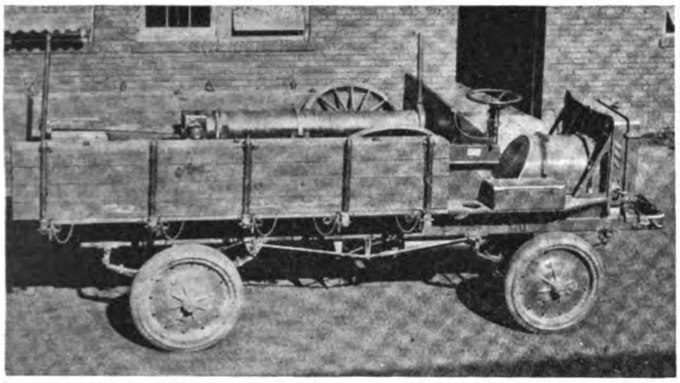
Army Automotive Equipment



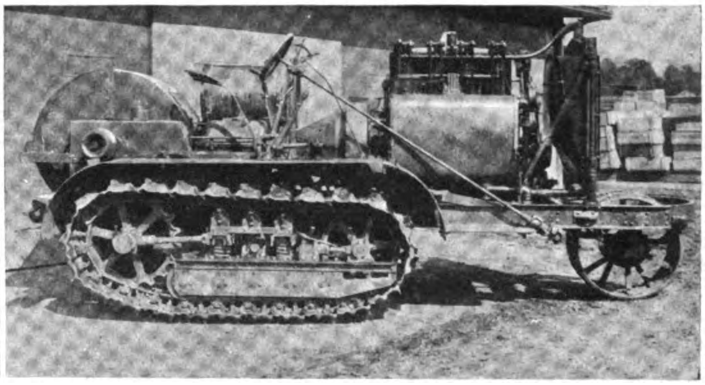
The standard gasoline electric locomotive used in France by the A. E. F. for moving large railway mounts to and at the front. This locomotive was used because it was considered desirable to eliminate the smoke which accompanies steam locomotives and which betrays them to the enemy



The 4-ton trailer equipped with a crane

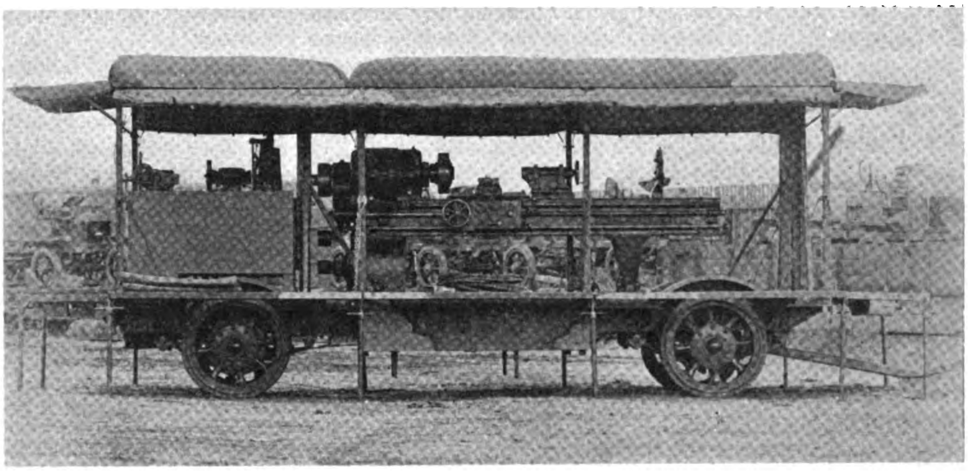


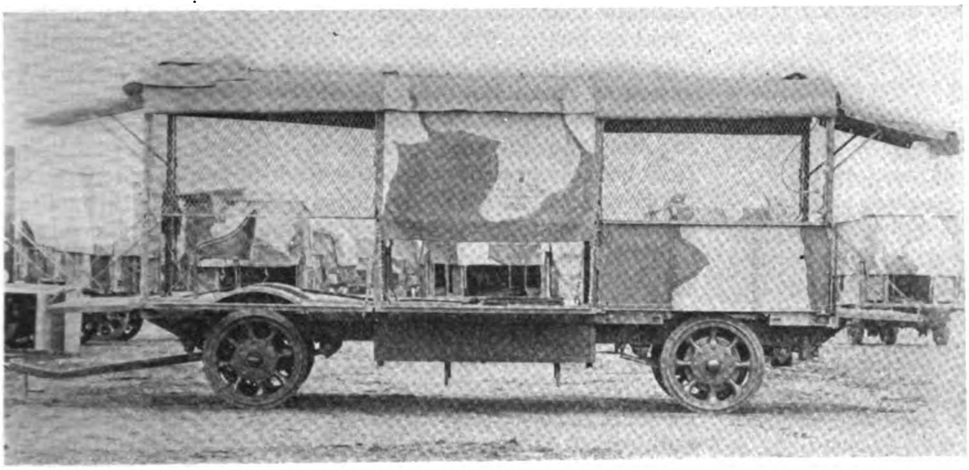
The trench mortar truck used by the A. E. F., with the mortar in the body



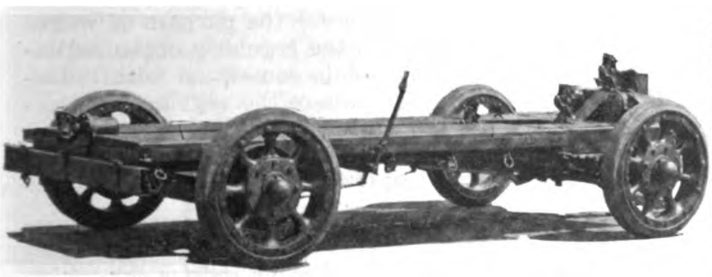
A close-up of the 15-ton artillery tractor—a 75-hp. machine produced by the Holt Co.

The lathe trailer. One of the units of the mobile repairshops. These repairshops comprise 12 trucks and trailers. As a rule they were hauled to convenient locations either along well traveled roads or near the front where they were parked compactly and conveniently and formed into repair depots

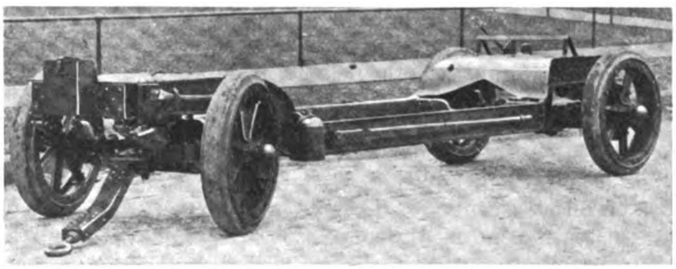




The parts and stockroom trailer —one of the units of the mobile repairshop



The 3-in. field gun trailer



The anti-aircraft gun trailer

Wage Questions Must Be Handled from Inside the Industrial Unit

Here, Workers' and Employers' Interests Are Concerned with the Same Common Problems of Production and Environment—Profit-Sharing and Collective Agreement of Highest Importance

By Harry Tipper

THERE are still some men who contend that the worker has no right to organize and that their employees have no right to join a union, and there are plenty of labor leaders who contend that the worker should be forced to organize and that nobody should work who is not a member of a union.

Both these conceptions are concerned with extending control in order to force the situation upon the opposite party. They are concerned with emphasizing the differences and minimizing the similarities. They create as much unrest as they claim to settle, because they are based upon unrest and turmoil and not upon agreement and peace.

In the last analysis this wage question must be handled from inside the industrial unit, where the workers' and employers' interests are concerned with the common problems of production and the common necessities of locality and social environment.

PRACTICALLY all the discussions which have occurred in connection with questions of contracts, collective bargaining, and the major points of industrial relations, particularly collective bargaining or wage systems, have assumed the necessity for the establishment of contracts between organized labor bodies and organized groups of employers and have based their conclusions upon argument starting from this assumption.

Most of the discussion, of course, centers around the wage system and the question of collective bargaining because of the fact that, while the question of wages is not the only question involved in the troublesome problem of industrial relations, it is the point of contact at which all other reasons for dissatisfaction acquire sufficient momentum to become active.

The lack of incentive, the desire to escape from work, the tendency to float from one organization to the other, personal grievances, competitive disadvantages and other items which enter ihto the causes of industrial unrest, and which are frequently the primary cause, do not become active causes until they are associated with the wage question.

The assumption, however, that this question of wages must be discussed upon the premise of collective bargaining between organized groups of labor and organized groups of manufacturers is not justified by the evidence contained in the history of labor and industrial development and it confuses the issues by preventing an examination of this question of wages in a fundamental manner.

The organized labor bodies in this country represent so small a proportion of the total labor that the aims and purposes of such organizations cannot be regarded as the primary cause of all the strikes and other evidences of industrial unrest which are occurring from time to time in all fields of industry and in all parts of the country. It is true that the aims and purposes of the labor organizations, being the only concrete and definite representation of the desires of the workers of industry, have been seized upon by all large bodies of unorganized workers in the endeavor to improve their own working condition.

Organization Influence Far-reaching

It is, furthermore, necessary to remember that the influence of the labor organization extends far beyond the confines of its own membership. At the same time the records of membership in the regular labor organizations indicate that the question of wages is decided for the great majority of the workers in this country without the intervention of the labor organization or the necessity for action of a manufacturers' group.

The fundamental difficulties, as all present systems of handling the wage question show, arise from the fact that they have grown up out of the tradition of free contracts between employer and employee determined only by the competition, the relative demand and supply and, consequently, the bargaining strength of the two parties involved.

From the standpoint of the employer, wages have been governed by necessity, and not considered from any human values. From the labor standpoint, wages have been governed by free competition, and they have been controlled almost directly in proportion to the collective bargaining strength developed in any one organization in any industry or at any particular time.

It is evident from an examination of the extent to which collective bargaining has grown, in the decision upon wages, that organization for the purpose of wages decision has gone far beyond the regularly organized labor bodies and has been used in connection with industries and bodies of workers where the regular labor organizations have little or no foothold.

Fundamental of Free Contracts

The reason for this is obvious. A fundamental condition of free contract is that either party must be at liberty to withhold the commodity or service for which he is bargaining. There can be no advantage to the worker in withholding his individual service, for that in-

dividual service is quickly replaced and he secures only the disadvantage of losing the bargain altogether by such action.

On the other hand, with the growth of industrial establishments in size and capacity, one individual manufacturer can withhold the possibilities of employment from a large number of workers at the same time and amplify the disadvantages to the worker which result from the inability to decide upon a given basis for operation.

So long as wages are based upon the ability to bargain, it is to be expected that organization for the purpose of securing bargaining strength will continue and enlarge itself, and that there will be a definite attempt to coordinate such organizations with regularly constituted labor bodies, unless the other necessities of industrial organization are recognized by the employers in their industrial field.

Aims of Labor Organization

The aims and purposes of the labor organization are the result of its fight for its existence and the extension of its power, and they are not concerned with the merits or demerits of the action; they are altogether concerned with the question of whether such action will increase the power of the labor body and place it in a better position to make that power felt when the necessity for bargaining arises.

Under this assumption of adjustment of wages, it is obvious that no thorough agreement can be reached at any time, but that all contracts must be in the nature of a temporary compromise, representing the present comparative strength of the two parties engaged in forcing the bargain. Whenever the strength of the two groups has changed in comparison, then the temporary terms, previously arranged, will inevitably go by the board in the clash of strength for a new adjustment of the bargain to the changed circumstances.

Several of the writers and industrial employers, who have attempted to suggest the development of other methods of adjusting wages, proceed upon the assumption that organized labor bodies and groups of manufacturers must control the newer collective arrangement as they have controlled the older collective bargaining, and they suggest standardization of wages, not in amount but through the different units of an industry and through joint standard boards functioning along the lines of those created in Great Britain and this country for war purposes.

Apparently these writers have not recognized the fact that the present organizations of labor, having been created and developed for the purpose of forcing bargains, and the present organization of employers, having been created for the purpose of defending the employers in such exhibitions of force, would be governed in their action upon joint committees by the constitution, the tradition and the precedent which make up their aims and purposes.

No Hope in Such Standards

It is impossible to find any great hope in such standards, based as they are merely upon the prevention of strikes and the adjustment of troubles by arbitration, instead of being the result of examination of the causes of these troubles and their settlement by the adjustment of the causes.

Furthermore, no man who has studied carefully the tendency in labor and employer organizations, especially in the latter part of their development in other countries, can view with any equanimity the prospect of a strengthening of these divisions of industry in their opposition, by the legalizing of joint committees appointed from these bodies and the power to compel the settlement of industrial questions through these means.

There is no will o' the wisp more alluring to the employer of labor than the compulsory arbitration suggested by these writers and attempted in some countries. A superficial examination of the work of such boards for a few years lends an appearance of success to the proposition.

Inasmuch as the organizations themselves are concerned with the use of force in obtaining the advantage in a bargain and not with securing co-operation in the attainment of a full agreement, the attempt at compulsory arbitration would simply transfer the strength from the semi-public atmosphere to the political atmosphere. There would be an endeavor to secure through politics what has been removed from the sphere of private action.

The effect of the labor organization in the collective bargaining system, through the history of its work up to the present, has been to increase the class consciousness of workers in various industries. In some countries it has solidified the class consciousness in a sufficient measure to make it formidable.

The grave danger in industrial relations, the gravest danger of all, is the increasing solidarity of class and the increasing divisions between classes emphasized by this form of organization.

An attempt to standardize the wage system by extending this method of collective bargaining until it carries over the whole surface of industry, headed by joint committees of workers and employers, legalized under a compulsory arbitration system, would but increase the class division and class solidarity which has so frequently been noted as the great danger.

In Great Britain to-day the strength of organized labor in the political life of the country is something which must be reckoned with by every thinking man and which finds its expression at every turn in connection with the legislative outlook. It is not in the direction of an attempt to solve the wage question by general systems of collective bargaining and arbitration that industrial satisfaction and efficiency lie.

Must Treat Industrial Unit as a Whole

Again it must be emphasized that the industrial unit is an organization and not a division of organizations, and no suggested method can bring any hope of prospective solution which does not treat the organization of the industrial unit as a whole, and particularly no solution can be expected by any system which emphasizes the division of interest that has been brought into the question by the attempt of both sides to gain more strength in the final action of collective bargaining upon the wage question.

The speeches of the labor leaders within the last few weeks indicate that the aims and purposes of the labor organization have not changed any but are still concerned with the control of the working conditions and not with any agreement with the employers as to those working conditions, while the statements publicly made by some of the employers and those representing employers' organizations have indicated the intention of the employers to retain control of the working conditions and not to give up any part of that control in the endeavor to arrive at an agreement.

For these reasons the profit-sharing systems within the organization and other systems of collective agreement upon wages inside the unit are of the highest importance to the manufacturer and should be considered with the utmost patience.

Austro-Daimler 200-Hp. Aircraft Engine

PART II

Details of Crankcase Construction—Ignition, Fuel and Cooling Systems—Results of Power and Endurance Tests—Analysis of Weights and Materials of Construction

THE lower half of the crank-chamber is complicated in design, and excessively heavy, weighing 73.5 lb., complete with false bottoms.

The walls are 6 mm. thick and are strengthened inside and out by ribs spaced 130 mm. apart.

A perforated plate of galvanized sheet steel is screwed onto a flange cast about half-way down the chamber. This plate has shallow oil sumps formed on it at each end and a large hole cut in it in the center; other holes, 25 mm. in diameter, are pierced in it in various places. Over this bottom is screwed a sheet of finely perforated steel, covered on the underside with very fine wire gauze. Below the filter plate the bottom of the base-chamber slopes sharply to the center portion, which is flat and has a small sump bolted on underneath it. Cooling ribs are cast in the two sloping portions, both inside and out; the sides of the base-chamber are carried down 40 mm. below the bottom and a strip of sheet aluminum is screwed on to their lower edge, thus forming an air chamber along the whole underside of the engine. The aluminum plate has three air ports covered with wire gauze at each end. According to a report these ports are fitted with a vaned shutter.

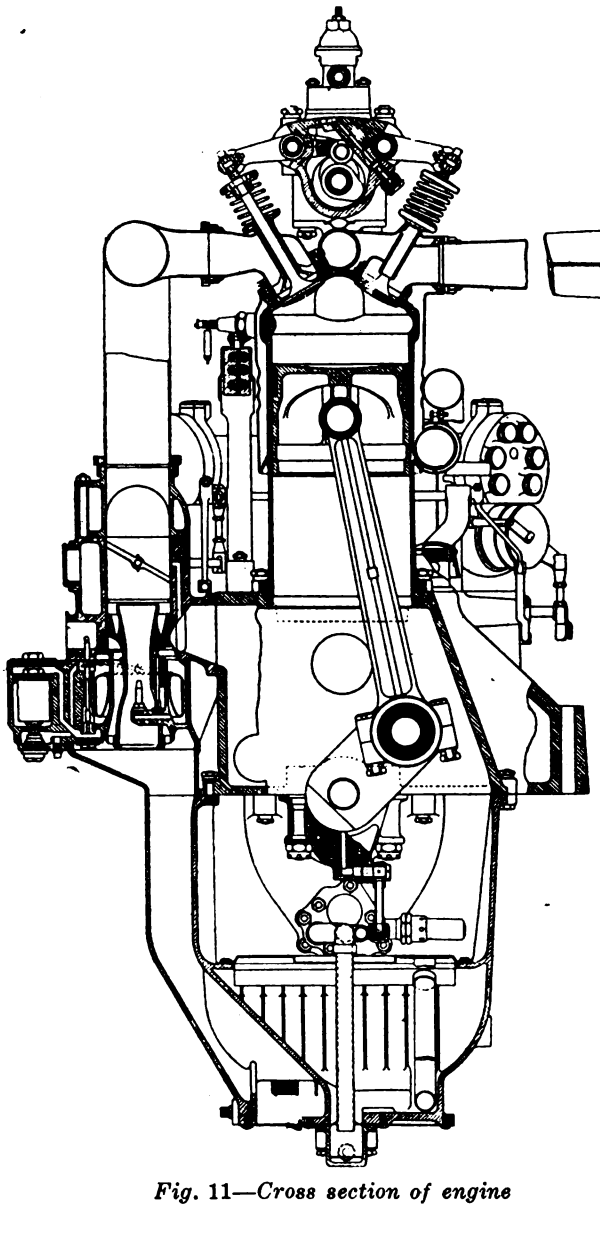


Fig. 11—Cross section of engine

The main air supply for the carbureter is taken from this false bottom through a passage cast in the side of the crank-chamber. The purpose of the false bottom is to cool the lubricating oil and warm the incoming air.

The lubrication system of this engine is on the wet sump principle, having one large pump to keep the main oil in circulation and a smaller sump to supply a small charge of fresh oil to the system at each pump stroke.

In this engine the main pump sucks oil from the sump, which is approximately of 7 gal. capacity, and delivers it under pressure to the main journal bearings.

Oil Pump and Lubrication System

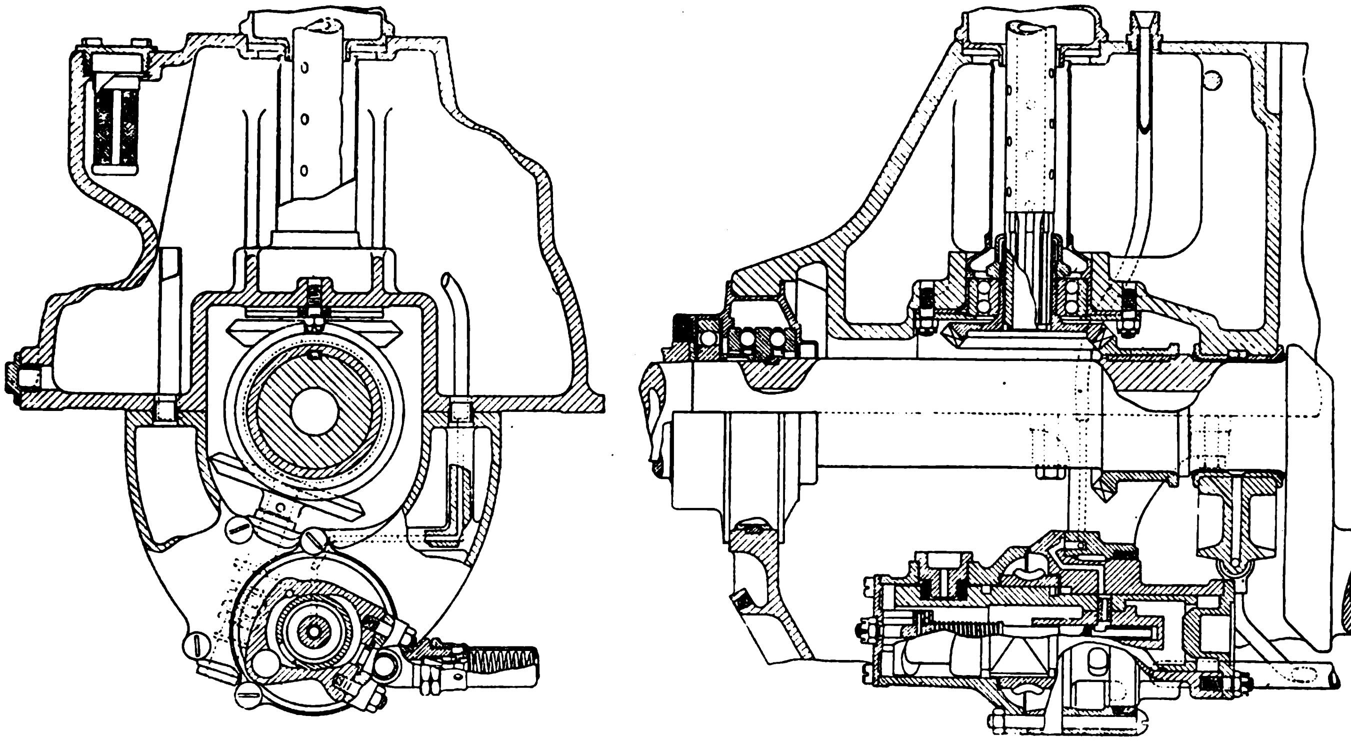
The small pump supplies the camshaft with fresh oil taken from the tank cast in the top half of the crankcase. The main oil pump consists of a steel plunger 40 mm. in diameter, working in a cast iron barrel. This plunger is hollow and has another plunger or ram, 7 mm. in diameter, fitted inside it. Both the barrel of the pump and the small plunger remain stationary, while the large plunger is rotated by means of a bronze worm wheel, which floats on a square formed on the plunger. The worm wheel is driven from the crankshaft by a worm cut on a small inclined shaft. Besides rotating, the plunger is made to reciprocate by means of a scroll cam machined in the plunger, which works against a hardened steel roller fixed into the pump barrel, and thus transmits the reciprocating motion to the plunger, the end of which is plugged and forms the piston of the main pump.

The small ram fitted inside is also hollow and works on the same principle, though in this case the barrel moves while the ram remains stationary. A port cut in the side of this small plunger is put in communication alternately with the supply pipe from the tank and the delivery pipe to the camshaft, by means of an oil way drilled radially in the main plunger. From the main oil pump the oil is forced along a delivery pipe to the center of the engine, where it feeds the main oil lead running beneath the crankshaft and connected to each of the journals by vertical branch pipes.

The crankshaft is bored and plugged in the usual manner and conveys oil from the journals to the crankpins, whence the oil is forced up the small pipes attached to the connecting-rods into the little-end bearings.

The delivery pipe from the small pump to the camshaft is taken up the front end of the engine and runs along outside the camshaft casing, being connected to the oil ways drilled in the cover plates by six inclined channels formed in the cover plates.

From this central oil lead in the cover plates the oil is conveyed to the camshaft bearings by the vertical holes drilled in the ends of the cover plates, and to the rocker arms by



Figs. 12 and 13—Vertical shaft drive and thrust bearings

short cross channels, which deliver the oil into grooves milled in the rocker arms, whence it finds its way to the journals of the hollow rocker spindles and their bearings, and also to the cam rollers and cams.

The camshaft is always kept half full of oil, and provision is made for filling up before starting by three holes fitted with threaded plugs, which are placed in the top of the cover plates.

From the camshaft casing the oil overflows through two grooves formed in the side of the front camshaft bearing and thence finds its way to the sump down the vertical spindle casing, lubricating the vertical spindle bearings and gears on its way.

The oil sump is exceptionally deep and is fed from the sheet steel false bottom by three pipes, one from each end and one from the center.

Ignition

The two Bosch Z.H.6 type magnetos are driven by bevel gears off the bottom end of the camshaft driving spindle at the front of the engine. The magnetos are mounted on aluminum brackets which are bolted to the top face of the crank chamber, which forms an extension over the auxiliary oil tank.

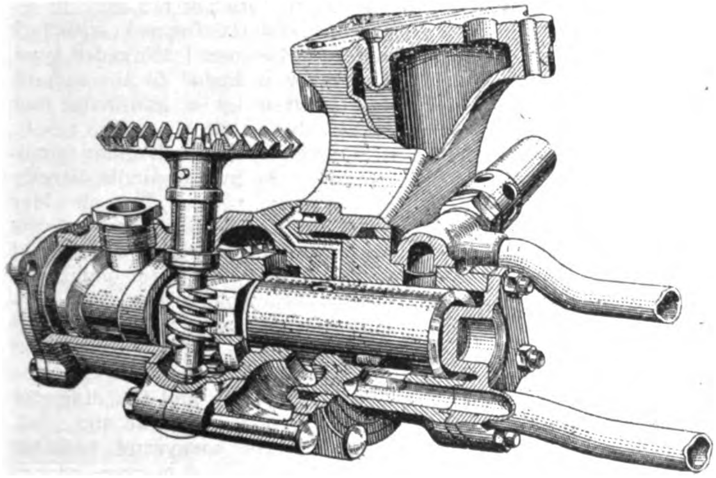


Fig. 14—Combined main and make-up oil pump

As will be noticed in the illustrations of the engine, the magnetos are placed diagonally, each magneto being driven at an angle of 52 deg. to the crankshaft axis, in a horizontal plane.

Two Bosch three-point spark plugs are fitted to each cylinder on the same side of the engine, being screwed into the combustion heads just below each inlet valve; each magneto, of course, serves one plug of each cylinder. The magneto controls are interlinked with the throttle control, so that when the engine is throttled down the ignition is automatically retarded. The order of firing is as follows: Propeller, 1, 5, 3, 6, 2, 4.

As shown in the illustration of the induction side view of the engine, Fig. 1, all the high tension leads from the magnetos are carried in a particularly neat form of cable carrier, which is made of red sheet fibre and is carried on cast aluminum brackets attached to the top of the crankcase.

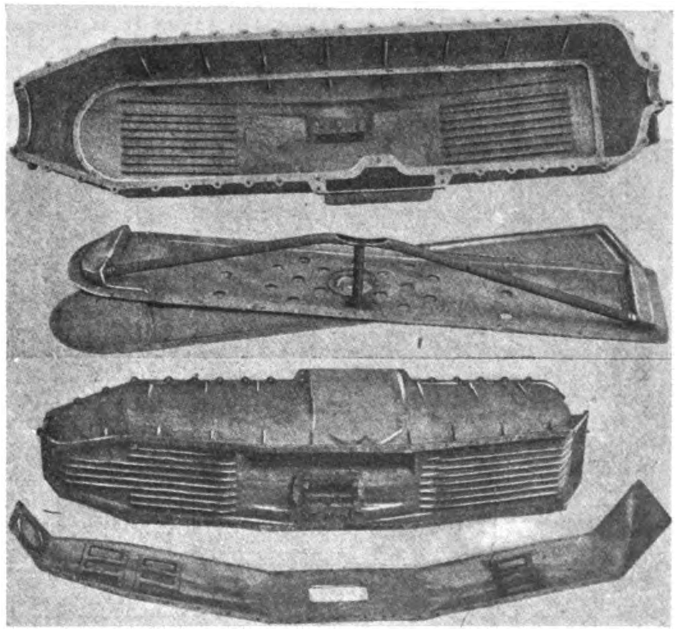

Fig. 15—Crankcase sump

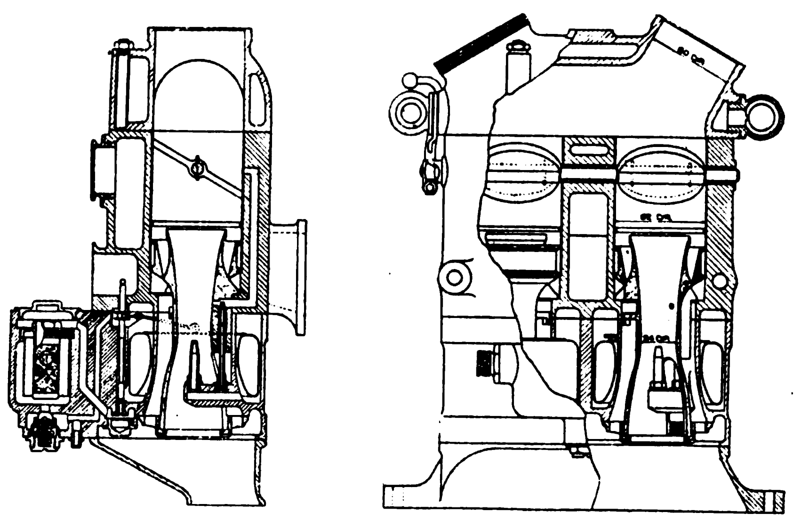

Fig. 16—Two sectional views of the carbureter

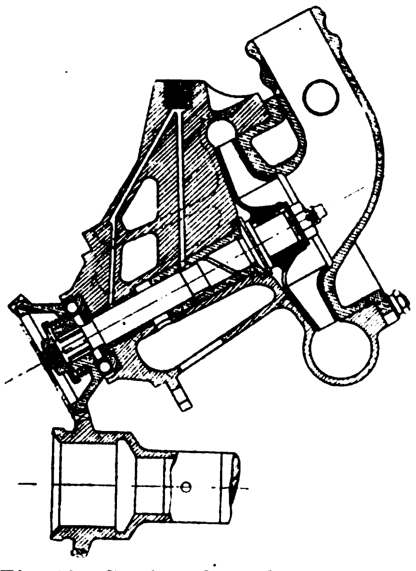

Fig. 18—Section through water pump

The large duplex carbureter is placed on the left side of the engine, and supplies the mixture through two separate galvanized steel induction manifolds; each manifold feeds three cylinders and is lagged with asbestos. The carbureter is built up in three sections. The bottom section—which is made of gun-metal—contains the two float chambers and the four jets. A common filter chamber fitted with the usual gauze strainer is cast on the front of this portion. The center portion of the carbureter—which is made of aluminum—contains the butterfly throttles and the upper portion of the choke tubes.

A large air chamber, cast round the throttle barrels, is used as the outlet for hot air from the crankcase, and thus helps to warm the mixture. The top portion of the carbureter consists of a cast aluminum chamber, in which the supply for the two carbureters is united, thus insuring an equal supply to each manifold. This chamber has a waterjacket cast round it, which is connected to the main water circulation system by a pipe at each end.

The annular float chambers encircle the choke tubes. Two jets are fitted in each carbureter, the capacity of the main jet being 35 cc. per minute, and that of the pilot jets 5.8 cc. per minute.

The filter is fitted with a pressure release valve which discharges into a small chamber below the filter, where it unites with the overflow from the float chambers.

The air supply to the carbureters is taken from the false bottom, through a passage cast in the side of the crank chamber. An extra air valve is fitted round the choke tubes.

In the Austrian "Berg" biplane scouts, fitted with these Austro-Daimler engines, the main fuel tank is under pressure and is situated at the bottom of the fuselage, behind the engine. A small gravity tank holding 3½ gal. is also fitted as an emergency fuel tank, just behind the engine in the upper part of the fuselage, and the total air endurance according to report is given at 2½ hr. at 1000 ft.

Air Pump

The air pump for the fuel tank pressure is of the spring-loaded plunger type, and is operated by a separate cam on the camshaft between the two rear cylinders. As shown in the sectional arrangement drawing of the compression release gear, it is mounted on the cover of the cast aluminum camshaft casing.

A hand pressure pump is also fitted in the machine.

Water Pump

In Fig. 18 is given a sectional view of the complete water pump. This is of the centrifugal type, and as shown in the views of the engine is driven directly off the rear end of the crankshaft by a bevel gear which is integral with a sleeve forming an extension shaft. This is attached to the rear end of the crankshaft, and also drives the gun interrupter gear through a worm gear on a transverse shaft.

The water pump spindle is inclined at an angle of 30 deg. to the crankshaft and runs in phosphor bronze bearings. The driving bevel gear floats on the end of the pump spindle, and is fitted with a large diameter thrust ball race and retaining spring, which, being at the bottom end of the spindle, are as far away as possible from the rotor of the water pump. Both the pump spindle bearings are well lubricated, through two drilled holes in the pump body and oil grooves cut in the spindle bearings, by a large self-acting grease lubricator which is screwed into the cast aluminum water-pump body.

The pump rotor is 112 mm. in diameter and is formed with six vanes of the usual Mercedes type. The rotor is keyed to the spindle and secured by a gun-metal nut and washer.

A conically faced shoulder is machined on the pump spindle directly beneath the rotor. The shoulder beds into the beveled face of the bronze bearing, forming an efficient water joint. The water pump, although somewhat heavy in its construction, is well designed and is very accessible. The diameter of the intake passage through the cover is 36 mm., and the diameter of the delivery is also 36 mm.

A "V" type honeycomb radiator is used with this engine, and is mounted at the front of the engine, directly behind the propeller.

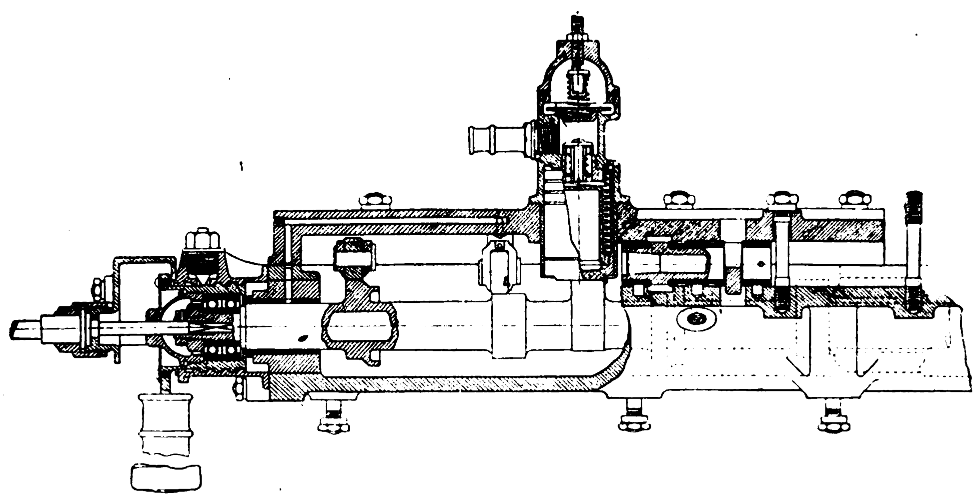

Fig. 17—Camshaft and air pump

The capacity of the radiator is approximately 4 gal., and a small barrel-shaped condenser, 4 in. in diameter and 5 in. long, is provided on the top of the radiator, apparently to prevent boiling water from escaping and blowing back. No louvres or blind are fitted to prevent over-cooling.

From the bottom of the radiator water is circulated through the steel pipe to the inlet of the water pump and is delivered into the bottom of each of the cylinder waterjackets. These are coupled together in the usual way by rubber joint rings and clips, both at the bottom of the waterjackets and in the water passages above the valves in the cylinder heads. The construction of these joint rings is interesting, consisting of beveled rubber rings, reinforced in the center with a steel spring ring. The rubber joint rings are expanded into the outside of the conical faces of the steel water connections on the cylinders by the halves of a split aluminum ring, which are clamped together by a band clip of ordinary design. From the results and appearance of the engine during tests these water joints are very efficient. Circulating through the cylinder waterjackets, the water passes to the top of the radiator through two passages cast in the front end of the aluminum camshaft casing. These water passages encircle the camshaft just behind the driving bevel gears.

Revolution Indicators

A flexible drive for the engine speed indicator is driven directly off the rear end of the camshaft in a small extension chamber, and some form of revolution indicator was apparently mounted in the center of the "V" radiator. Unfortunately the instrument is missing, but a portion of the driving mechanism is shown in the general arrangement drawing, from which it will be seen that the gear employs a small diameter worm mounted about half-way up the vertical driving shaft. This engages with a worm pinion which drives a grip-gear pinion at a speed ratio of approximately 1:100.

Wireless Generator

A flange is machined on the rear extension of the crankshaft to take a belt driving pulley for the wireless dynamo. This pulley is probably of the standard friction clutch type used on all enemy engines.

No exhaust manifold or muffler is provided, but a separate short exhaust pipe about 12 in. long of streamline section extends from each cylinder.

Conclusions

The design of this new type Austro-Daimler engine, as set out in the foregoing detailed description, and the following data and test results, shows a careful study of details.

Both in its general lay-out and in most of its details of construction this engine undoubtedly possesses more originality in design than the majority of enemy engines up to the present time.

The design of the lubrication and oil-cooling system has evidently been carefully considered, as have also the carbureter and induction systems.

The new type of scroll cam oil pump is interesting, but in its present form is excessively heavy. This type of oil pump, however, it is interesting to note, is now used on the new 270 hp. Bassé-Selve engines. In these engines the oil pump works on exactly the same principle, but is duplex and is relatively much lighter, the body of the pump being made of cast aluminum instead of cast iron.

R. A. E. Calibration and Endurance Test Report

The 200 hp. Austro-Daimler engine was coupled to a Heenan & Froude dynamometer, and run for the usual calibration and one-hour endurance tests. Power, throttle, and consumption curves are given in Fig. 19.

Calibration Results

R.p.m.	1300	1400	1500	1600
B.hp.	186	200	212	222
Brake m.e.p.	123.5	123.3	122	119.7
Fuel consump. in U. S. gal./ b.hp./hour	.086	.085	.0852	.0854

The engine was submitted to an endurance test of one hour's duration at normal revolutions, *i. e.*, 1400 r.p.m., with the following results:

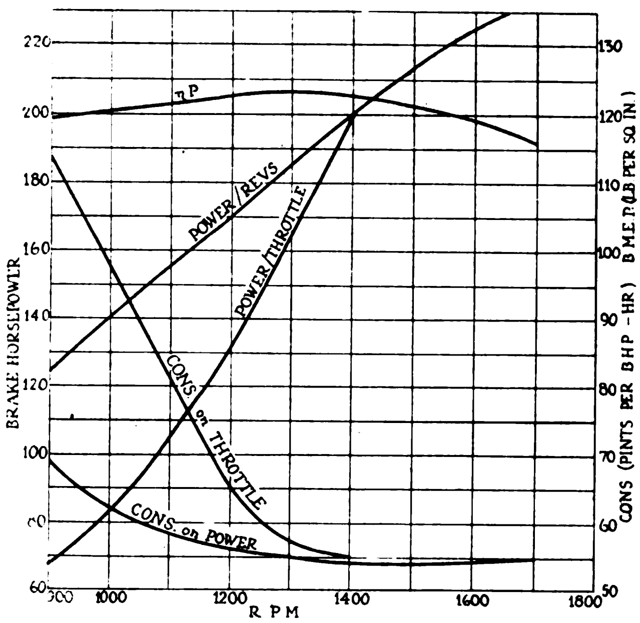

Fig. 19—Performance curves

Average output	202 b.hp.
Average speed	1400 r.p.m.
Fuel consumption per hour	16.8 U. S. gal.
Fuel consumption b.hp. hour	0.665 U. S. pints/b.hp./hr.
Oil consumption per hour	8.4 U. S. pints.
Oil pressure	5 lb./sq./in.
Oil temperature	50 deg. C.
Water temperature (inlet)	54.5 deg. C.
Water temperature (outlet)	60 deg. C.
Total duration of tests	10 hr. 25 min.
Complete weight of engine	728.5 lb. dry.

Weight per B.hp.

At 1300 r.p.m. = 3.81 lb. per B.hp.
1400 r.p.m. = 3.64 lb. per B.hp.
1500 r.p.m. = 3.43 lb. per B.hp.
1600 r.p.m. = 3.28 lb. per B.hp.

Running During One Hour Endurance Test

Very steady between 700 and 1700 r.p.m.

At 500 r.p.m. vibration was bad, and below this speed running was generally unsteady.

Distribution

Very good.

Cleanliness

Throughout the test the engine kept remarkably clean. No trace of oil or water leakage was observed.

Troubles Experienced on Test

The K.L.G. spark plugs fitted for the test gave trouble by shorting internally.

The valve tappets required to be readjusted during the test.

Test of Water Pump

Speed of the water pump spindle = 1.894:1 crankshaft revolution.

The delivery of the water pump under varying pressures has been made the subject of a separate test The pump was coupled to an electric motor and run with the following results:

R.P.M.	Pressure	Delivery
1800	2 lb. sq. in.	50.5 U. S. gal. per min.
1800	4 lb. sq. in.	44 U. S. gal. per min.
1800	6 lb. sq. in.	36 U. S. gal. per min.

The weight of the complete water pump = 7.6 lb.

Engine Bearing Proportions

ALTHOUGH automobile design, and especially engine design, has attained to a high state of perfection, there is no doubt that further progress is possible in many details. But the more nearly perfect the design the more difficult it becomes to make improvements. It was pointed out at a recent meeting of the S. A. E. Buffalo Section that the best results cannot be achieved by measuring up existing engines and striking an average. While this method is a fairly safe one and may commend itself to the designer with little experience, no progress can be hoped for from it.

There are just two methods by which present design can be rationally improved. The first is to carefully observe the behavior of engines in practice or study reports to the service department, noting what parts give most trouble and considering the causes of these troubles. The other method consists in studying the forces on the different parts of the engine analytically and proportioning the parts in accordance with the loads they will have to bear.

An interesting illustration of the way in which engine design is gradually being improved through observation of the frequency of different repairs and through analytical investigation is afforded by the central main bearing of a four-cylinder crankshaft.

In the earlier four-cylinder engines this bearing was generally made short, owing—in one sense—to lack of space. The designer would settle upon his cylinder center distance in accordance with the dimensions of cylinder bore, depth of waterjacket and wall thicknesses, placing the cylinders as close together as possible, and this would unnecessarily leave little room for the central bearing. The rear bearing was made long because it had to support the flywheel, and the forward bearing generally also was liberally proportioned because there was plenty of space in front. Anything added to the length of the central bearing meant that much added to the length of the crankcase and the whole engine.

It was observed, however, in practice by manufacturers having numerous four-cylinder engines in service that the central bearing invariably required renewal first. A little reflection readily suggested the reason for this. The greater part of the load on any crankpin is taken by the main bearing adjacent to that crankpin, and as there are two crankpins adjacent to the central bearing the latter supports the pressure of the explosion twice to once on each of the other bearings. This determines the distribution of bearing loads at low speeds.

At high speeds the inertia of the reciprocating parts is the most important of the factors determining bearing loads. Now, adjacent to the central bearing there are two sets of reciprocating parts which move in unison, and their inertia forces add together. The same applies to centrifugal forces, and the result is that the mean or average load during the complete cycle is much greater on the central than on either the front or rear bearing. In a four-cylinder engine the weight of the flywheel is small as compared with the inertia and centrifugal forces at high speed, and it is a rather curious fact that while designers have always been very conscientious in providing in the bearings for this weight they have paid little or no attention to the inertia and centrifugal forces.

An analysis of main bearing pressures on four-cylinder crankshafts has been made by Otto M. Burkhardt and presented in a paper read before the S. A. E. Buffalo Section. Mr. Burkhardt's figures show that under full load at normal speed the average bearing load on the central bearing is 70 per cent greater than the load on either end bearing, and while idling at high speed the average load on the central bearing is even twice as great as that on either end bearing. In determining the relation between the bearing lengths it should be borne in mind that the engine works at nearly full load only part of the time. Account can be taken of this by giving different "weights" to the relative load factors, these weights depending upon the proportions of the time the engine runs under these load conditions.

Wishing Is Not Winning

"IF the United States is to have any foreign trade, she has got to get busy."

In just so many words has the situation been sized up by an American business man, a returned traveler who is a keen observer, whose experience gives weight to his opinions and who is accustomed to look far into the future.

To-day, the markets of the world are open to us as they never were open before. Our neighbors across the seas need our products as they never needed them before.

But "America has got to look out for herself."

The industrial plants of our international trade rivals have been far more disrupted than have those of America. Production of peace-time essentials has been cut to the bone. The resources of our Allies have been centered on the production of the sinews of war to a far greater extent than have those of America. Our Allies must overcome the handicap of four years of war as against our one.

But they have also the advantages of that four years—they have learned the lesson of quantity production, which under normal conditions might have taken much longer to learn. They are living in the midst of the realization that foreign trade must be developed to the utmost to help pay their war indebtedness. And they undoubtedly will grasp the opportunity which the learning of the lesson has put within their reach.

"America should go quickly after the markets of the world."

America has never been in a better position to enter world trade on that comprehensive scale the world now wants. Our factories have been marvelously expanded. They have learned to diversify their lines. They have been compelled to supply demands which hitherto have been supplied from abroad. They have been thrown upon their own resources to produce, not alone for ourselves, but for our Allies as well, hundreds of products which hitherto have come from our enemies.

And last but not least we have the ships. Already we have seen reductions of one-fourth to one-third in existing ocean freights to South America, Australia, and Africa—a reduction which has been made to induce American shippers to take advantage of the tonnage now available.

Wishing is not winning. "Foreign countries are going after world trade in a way that will make America sit up and take notice." Nothing but an aggressive policy based upon a well-formulated plan, will give to American industry that share of world trade which is its just due—and which it must have.

Prospects of Civil Air Transport

DURING the past two months a number of forecasts of the future of commercial aeronautics have appeared in the press from men at the head of aircraft manufacturing corporations, aero clubs, etc. Most of these have taken a rather roseate view of the prospects of this new means of travel, though practically all admit that the immediate future is beset with difficulties.

In England, where forced development of the aircraft industry began about 3 years before it did here, and where the industry has grown to an enormous size, anxiety concerning its fate at the end of the war began to be felt more than a year ago. In order to pave the way for commercial applications of aircraft as soon after the war as possible, a Civil Aerial Transport Committee was formed to report to the Air Board with regard to the steps which should be taken.

This committee has recently made a report. Unfortunately considerable material has been deleted from the published text; what remains, however, makes quite interesting reading. The problem is dealt with under five headings, namely, Municipal Control and Legislation, Technical and Practical Questions as to the Possibilities of Performance of Aircraft, and as to the Requirements of Aerial Services, Business Questions Relating to the Possibilities of the Aircraft Manufacturing Industry After the War, Questions of Labor and Problems of Scientific Research and the Education of Expert Designers, Engineers and Pilots.

The tone of the report is a most reserved one and quite in contrast to some of the optimistic predictions made by others recently. It is pointed out that the conditions of success are radically different in developed and undeveloped countries respectively, as in the former aerial transport must compete with existing means of transport and communication, while in the latter it would practically be without competition. The committee holds the view that while carriage of mails, passengers and certain kinds of light, valuable merchandise by airplane will be successfully developed after the war, the amount of business in sight in these lines is altogether inadequate to keep the highly developed industry going, and state aid is advocated, in view of the fact that the maintenance of the aircraft industry's productive capacity is considered essential to the safety of the Empire. As to what form the assistance should take, whether the Government should give assistance directly to private enterprises or should assume exclusive ownership or participate in the ownership of air transport lines, the committee does not feel prepared to say.

From comments in the British aircraft press it appears that the aircraft industry has been somewhat disappointed in the report. While it is urged that "The British Empire should not be allowed to lag behind other nations in preparing for civil aerial transport," the recommendations made are all limited to further investigation and preliminary action, so that the prospect of immediate outlets for the products of the aircraft industry is not visibly improved by the report.

Sales for Export Not Taxable

But Domestic Sales, Subsequently Exported at Instance of Buyer, Pay Tax

NEW YORK, Jan. 6—Passenger cars and trucks sold by the manufacturer on a bona fide export order are not taxable under the provisions of the present War Revenue Bill, according to a ruling which the National Automobile Chamber has just received from the Treasury Department. But where a car or truck is sold to a domestic concern and subsequently exported at the instance of the buyer the tax is collectable.

The ruling makes plain that a sale to a concern doing business in the United States is a domestic sale unless the terms of the original order or contract of sale show that the seller is to export the vehicle, or that he is to make such delivery of it as will result in its exportation; in the latter case the tax is not to be collected. Where a car or truck is sold by a manufacturer, and subsequently exported, the manufacturer must pay the tax. To claim exemption from payment of the tax, the person making the claim must show that he is the exporter.

The Treasury Department originally ruled that cars and trucks may normally be exported in the following ways:

1—They may be shipped by the manufacturer to an agent in a foreign country and after reaching there may be sold by the agent.
2—They may be shipped by the manufacturer to a foreign purchaser to fill orders received by an agent in a foreign country.
3—They may be shipped by the manufacturer to a foreign purchaser to fill orders received by the manufacturer in the United States.
4—They may be shipped by the manufacturer to a foreign purchaser to fill orders solicited by mail and received by mail from the foreign purchaser.

Examples of sales by a manufacturer which are taxable, notwithstanding ultimate exportation of the articles sold, are:

1—A sale to a dealer in the United States, effected by compliance with his shipping instructions to export, given subsequent to the contract of sale which did not require export shipment.
2—A sale to an export commission house in the United States, which is effected by a shipment consigned to the commission house at a domestic port which is followed by immediate exportation by the commission house to a foreign buyer, in whose behalf it made the purchase.
3—A sale to a corporation in the United States which immediately exports to a foreign concern of which it is a subsidiary.
4—A sale to a member of a foreign partnership who conducts a buying business in the United States for his firm and exports the articles bought. In these cases the application of the taxes is not affected by a provision in the contract of sale requiring the buyer to use or dispose of the article sold only in some foreign country (T. D. 2781).

The new revenue bill, if enacted in its present form, gives authority to the Secretary of the Treasury to make provision for the exemption from tax of all cars that are ultimately exported.

Trego Motors to Make Passenger Car Engine

NEW HAVEN, Jan. 8—The Trego Motors Corp., of which Frank Trego, formerly chief engineer of the Packard Motor Car Co., is head, is shortly to place on the market a high class six-cylinder engine designed for passenger car use. The Trego company was formed about a year ago for the production of Liberty aircraft engines, but in July of this year transferred its manufacturing activities from aircraft to ordnance work. It is understood that the new engine will be of the L-head type designed for maximum efficiency. No particulars regarding the design or construction have been made public.

—

Four Army Planes Reach Atlantic

NEW YORK, Jan. 8—The four army airplanes which left San Diego Dec. 4 arrived at Hazelhurst Field, Mineola, L. I., last night, having covered the 3800 miles in 55 hours of actual flying time during the 34 days consumed in making the trip. The trip was started originally to map an aerial postal route between San Diego and El Paso. Plans were later changed to take the four planes completely across the continent.

—

Average 172 M.P.H. in Martin Bomber

CLEVELAND, Jan. 8—In the first bombing plane turned out by the Glenn L. Martin factory, Pilot Eric Springer and one passenger flew the 215 miles between Dayton and this city in 1 hr. and 15 min., averaging 172 m.p.h. The machine is one of a new type, weighing 2500 lb., and being equipped with two Liberty engines.

Beecroft Due Back Jan. 23

LONDON, ENGLAND, Jan. 7—Special Cable—David Beecroft, directing editor of the Class Journal Co., who has been in Europe since Oct. 26 as a member of the party of business paper representatives who have been the guests of the British Government, will sail for New York on the Adriatic on Jan. 15. The steamer is due in New York Jan. 23 or 24. All of the party returned on Jan. 2 except Mr. Beecroft, who remained to make a tour of manufacturing industries in Italy.

N. Y. Truck Show Space Allotted

Forty-Seven Dealers Get Space in Garden and Armory—M.A.M.A. Approves Event

NEW YORK, Jan. 6—Practically every inch of available truck space in both Madison Square Garden and the Sixty-ninth Regiment Armory was contracted for at the drawing for floor space in the commercial vehicle section of the nineteenth annual New York Automobile Show, which took place Saturday at the Automobile Club of America.

There are still four spaces unallotted, but for these there are thirty applicants. The only opportunity prospective exhibitors who did not secure space will have to obtain any will be in the event of some exhibitor cancelling space. Practically all of the established motor truck dealers from New York's automobile row, numerous factory representatives and out-of-town dealers were present at the drawing.

Both Garden and Armory Used

This commercial section of the show will be held Feb. 10-15, immediately following the passenger car exhibit, Feb. 1-8. So large are both sections of the show to be that no single building in New York is adequate to hold either. The Garden and Armory together will house the passenger car section during the first week, and the second week the commercial vehicle section, including motor trucks, delivery wagons, tractors, etc., will occupy both of the show buildings.

Yesterday it was a source of great gratification to the members of the Automobile Dealers' Association, under whose auspices the show is being held, to learn that members of the Motor and Accessory Manufacturers Assn. have decided to exhibit this season as they have at the New York and Chicago automobile shows of the past.

An enormous display of accessories is now assured for both sections of the show. In fact, it should be a record-breaking array for the reason that more floor space is available for accessories than was the case in former years when the entire show was housed in a single building.

Each season numerous accessory makers have been unable to obtain space because of not having applied early enough in advance. With the augmented space a number of these can be accom-

Commercial Aviation Here in Few Years

Is Surely Coming, Say Profession's Leaders at Big Meeting of Manufacturers' Aircraft Association—Wise Progress Urged—Exposition to Be Held

NEW YORK, Jan. 8—That commercial aviation is a reality of the not distant future, and that the demands upon aviation in peace will surpass the demands made by war, was asserted on numerous occasions last evening at the dinner of the Manufacturers' Aircraft Association at the Waldorf-Astoria.

The dinner brought together the many factors that have been operative in aviation during the period that America was engaged in combat. There were men who designed engines and planes, men who guided their output, men who had to do with their despatch to the front, and the men who flew them over the German lines and brought the war to an end much sooner than the world expected.

And all of these men, speaking from an intimate experience that is not the good fortune of those who have been more remotely placed, spoke confidently of transatlantic flights, planes engaged in mail and commercial work, long flights and safe landings in now impossible spots, made possible by the designs that will come through the demands of peace just as present designs came in response to the demands of war.

As a first step in the big future that all expect for aviation is the Aeronautical Exposition which the association will hold in Madison Square Garden Feb. 27 to March 6. It is expected that at least fifteen complete planes can be shown in the Garden, and with them the detail of the many designs and engineering features that have hastened into being during recent months.

It was urged that there be schools of aviation, just as there is an army school at West Point and a navy school at Annapolis. The country now has hundreds of trained fliers, all anxious to keep on flying, and it was held that if progress is wise and not too forced the science and art can be developed highly within about five years. It was suggested that present aircraft manufacturers be encouraged to continue their aviation activities in parts of their plants.

I think, said John D. Ryan, former head of air work, the peace requirements—and I don't believe I am overoptimistic—will in time startle the world. I don't think it is coming to-day, and I should regret very much if it were pushed too much. I think with care and caution and development, and trial, that the aeroplane can be made as necessary in peace almost as it is in war, and I believe it is in good hands. I believe the manufacturers of this country, who are in the aircraft business to-day, will see it to their own interests to proceed cautiously, carefully, and make as few false starts as possible, develop it on broad lines and bring it to the fruition it deserves.

I should think that it would be plain to almost anybody that in the necessity for the defense of a great country like ours, with a great coastline like ours a very extensive aircraft program is a very desirable thing.

I think the science of aviation should be encouraged in every possible way. I would have an academy of aviation, just as we have a military academy at West Point and a naval academy at Annapolis. I would educate the boys of this country from the time they are boys, in aviation, strictly, and almost exclusively, and I think that with the proper expenditure and the proper direction, within five years from now an enemy fleet that attempted to reach the shores of the United States would be detected and located so far out at sea that it would be put out of business three or four hundred miles beyond the reach of the shore. (Applause.)

I don't think there is anything in the nature of a dream about that. I don't think that any one who studies what has been accomplished in aviation, and who thinks what might be accomplished, can consider that at all a dream.

We now have planes that have a long range. We will have planes with a longer range, not necessarily the fastest planes, but planes with a long range that could absolutely detect the presence of a hostile fleet on its way to these shores, at least five or six hundred miles before they could reach us. Not deprecating in any way the great naval defense that we want in this country, and that we must have, I would say the planes could locate the fleet and the navy could destroy it; it could be told where it was and destroyed before it could reach us.

I think it is a great pity that the brains in the aircraft organization, naval, as well as in the army, should be scattered. I think that the civilians who have come into this work, able engineers who have gone so far in this work, should be used, should be kept, should teach the younger generation all they know, pass it along, and that these great organizations that have been got together under the stress of war should not be dissipated and go back to their civilian employments without leaving with the country the benefit of all they have learned.

I think that the great manufacturing organizations should not be destroyed or allowed to fall into disuse. I don't advocate the building of great numbers of aircraft for military purposes. I don't think it is necessary. But I think that sufficient encouragement and employment can be given to the well-developed aircraft factories of this country to keep them in the aircraft business, to induce them to make every discovery, to do everything they can to promote the science of aircraft. The organization should be kept intact, and the men who are able and who have done this thing should be kept together as far as possible. It would be a small expense, and God knows it might be a great measure of economy some day.

Some people have criticized our work in aviation on the front, some people have said we have been too reckless. People have told me that our boys were too reckless if anything; the French told me that our boys were too reckless; some of our own good friends have said that our boys were too reckless, but God bless them! That is what won the war, the fact that our boys were too reckless.

I saw them in France when the clouds were low, and when it wasn't a fit day for anybody to take the air, go out and fly 50 and 60 meters above the ground and bring back a complete record of what was ahead of them. General Pershing told me when I talked with him, on the second day of the battle of the Argonne, that no army ever went out with the information as to what was in front of it as the American army did in St. Mihiel and the Argonne.

Probably the loudest cheers of the evening were for Col. W. A. Bishop, Canada, who has an official record of having brought down 75 planes. A modest young man of 24, he is said recently to have been called a "coward" by a humorous friend because he was "afraid" to sit in the front of a box at a theater. However, last evening he was styled the "All American Ace," and, after telling a bit about aviation in war, he had this to say about aviation in peace:

Speaking of the future of aviation, one can only say that aviation has been made by this great war. At the beginning of the war it was a dream of the pioneer of fliers that flying machines should help to scout and do other work, and they did at the beginning of the war, but no dreams that those pioneer fliers could possibly have had could possibly picture the wonderful development which aviation has had during the past four years.

Each month of the whole course of those four years new improvements and new machines have steadily come to the different fronts, and with those improvements and those new machines new work has developed for the aeroplane, and instead of, as was at first thought, an aeroplane would simply do scouting work and the odd bit of looking around here and there, it now takes part in every action in any kind of warfare, and no action is complete without its perfect co-operation.

I feel convinced—and really I have seen aeroplanes do some extraordinary things—I feel absolutely convinced that the future of aviation is not in warfare; it is in commerce and I think that the wonderful record, the science of flying has had will be equaled and surpassed in the next few years by the development of commercial aviation. The first startling thing will be the transatlantic flight, and as every man here knows that is not far off, not for one machine, but for many machines. At the end of another year I feel quite confident that scores of machines will have crossed the Atlantic.

And a great number of men here to-night will doubtlessly take that trip. This trip will without doubt be done not only in the big machines, but in the small machines. Both of these types have their advantages for commerce. The general idea among the outside public seemed sometimes to be that the only machine fit for a commercial purpose is the big, many-engined machine. This machine undoubtedly has tremendous advantages in carrying weight, in going long distances, and by reason of its two, three or four motor engines, it may be more reliable, but the engines which have been turned out of late in your country, in England and France and Italy, have shown us that single engine machines may now be reckoned upon to be absolutely reliable, and that a person flying a machine with one engine, one of the good ones, may rely on that engine not to let him down.

This is undoubtedly the biggest step that

(*Continued on page* 78)

Massachusetts Wants Higher Fees

BOSTON, Jan. 4—Motor truck owners, and dealers in trucks and cars throughout Massachusetts will find that they will have to pay a very much larger sum to the State if the report submitted by the joint committee to investigate motor matters is accepted by the legislature. The most important, and drastic section provides for the fees for motor trucks. At present truck owners pay $5 for one ton and $3 for each additional ton.

The new fees provide:

1 ton, $15; 1½ tons, $30; 2 tons, $40;

2½ tons, $50; 3 tons, $75; 4 tons, $100; 4½ tons, $150, and 5 tons, $200.

For every additional ton there would be a charge of $200.

These fees would be paid by the owners of the motor vehicles.

The dealers at present are allowed a number of license plates for their cars, which are registered at a lower price than those in use all the time by owners. The report suggests that dealers pay the same fees as owners, and where a large dealer has a number of machines it will jump up his expenses considerably.

On top of that comes the division of motor dealers into three classes; those who sell machines, new and used; those who deal in used cars solely; and those who buy cars for junk.

They must all take out licenses in the city or town where they do business. And a fee for this may be charged as high as $100. Moreover, they must report every day to the Highway Commission every car or parts of machines taken in trade or bought.

Also those licensed under Classes II and III must hold their cars at least 4 days before reselling unless given special permission. This is the outcome of the hearings held for the past 2 years on the question of stopping the thefts of motor cars.

The load on trucks is restricted to 6 tons, and the length over all of trucks and trailers to 26½ ft.; height 11 ft.; width 92 in. Jitneys are to be limited to their carrying capacity for seats.

Remove Import Restrictions on Balata

WASHINGTON, Jan. 2—Restrictions on the import of balata, gutta-percha, gutta-joolatong and gutta-siak have been removed by the War Trade Board and licenses will be granted for any quantity providing that the bills of lading are endorsed by the Rubber Association of America, Inc. Government option prices on this rubber are withdrawn.

This relaxation of import restrictions does not authorize the importation of the above named rubbers from any country other than the primary or overseas markets.

Reo Guarantees Price

LANSING, MICH., Jan. 4—The Reo Motor Car Co. has guaranteed present prices on its various models until July 1. They are as follows: Five-passenger, $1395; three-passenger, $1395; four-passenger Coupe, $2175; five-passenger Sedan, $2175; Speed Wagon Chassis, $1250.

Workers Increase 3%; Wages, 23%

48 Automobile Makers Employ 117,290 in September and Pay Them $3,215,836

WASHINGTON, Jan. 3—Reports received by the Department of Labor from automobile manufacturers indicate a slightly increasing employment and a greatly increasing wage scale.

Forty-eight manufacturers reported 117,290 workers for September, 1918, 3 per cent more than the 113,889 workers employed in the same week of 1917. The wage scale for September, 1917, for these factories totalled $2,614,888, while in 1918 it amounted to $3,215,836, an increase of 23 per cent, which is highly significant as contrasted with the increase of 3 per cent in the number of workers.

Forty-three automobile manufacturers reported 103,931 workers for August, 1918, as compared to 105,673 for September, 1918, an increase of 1.7 per cent. The pay-roll for August, 1918, totalled $2,856,530, as compared with $2,924,456 in September, 1918, an increase of 2.4 per cent in contrast with the employment increase of 1.7 per cent, indicating that as late as September of this year wages were still increasing.

In a few instances, states the Department of Labor, there have recently been reports from some automobile manufacturers of slight decreases in the wage rate increase.

An average increase of 15 per cent affecting 30 per cent of the force was granted by one manufacturer. The shop employees in one factory and approximately 10 per cent of the organization in another received a 10 per cent increase.

One establishment reported 50 per cent of the force given a 5 per cent increase, while another establishment reported an increase of 5 per cent affecting 21 per cent of the employees. One-third of the force in one plant and the entire organization in another plant received increases, but no data were given as to the amount of the increase. A productive average hourly rate in one establishment was reduced approximately one-half cent.

Following is a complete comparison of employment in 13 important industries of the United States, indicating extraordinary increases in wages in every instance as compared to the increase of workers. Car building and repairing, it will be noted, has the highest rate of increase, with 104 per cent wage increase and 23 per cent workers' increase.

Good Coal Production for Year

WASHINGTON, Jan. 3—Bituminous coal production for the week ended Dec. 21 was 10,136,000 tons as compared with 10,616,000 tons the corresponding period of last year. Anthracite production for the week ended Dec. 21 totalled 1,839,000 tons as compared with 1,778,000 tons in the same period of 1917. The decrease in bituminous production was largely in Ohio, Pennsylvania and West Virginia. Illinois, Indiana, and South and West fields reported slight gains. From April 1 to Dec. 21 the total bituminous production was 441,361,000 tons compared with 402,824,000 tons in the same period of 1917. For the same period anthracite production totalled 72,541,000 tons this year as against 73,954,000 tons last year. During the week ended Dec. 14, coal production was 27 per cent less than 100 per cent due to the fact that there was no market, causing 11.3 per cent loss, labor shortage 7.4 per cent, car shortage 4.3 per cent, mine disability 2.9 per cent and all other causes 1.1 per cent.

Agricultural Implements Off Import List

WASHINGTON, Jan. 2—Agricultural implements have been removed from the list of restricted imports by the War Trade Board. The removals from the list also include nickel, zinc and grease. Licenses will now be issued for the importation of these commodities.

Vacuum Oil Company Restrained

WASHINGTON, Jan. 2—The Vacuum Oil Co., New York, was ordered to-day by the Federal Trade Commission to discontinue shipping its products without having previously sold or received orders for them from customers, prospective customers, or customers or prospective customers of its competitors. The order further prohibits the company from "inducing or attempting to induce in any manner whatsoever" consignees to accept such unbought or unordered shipments. The company has admitted, states the Federal Trade Commission, to have made shipments at market prices of "large quantities of its products without having heretofore sold or received orders for the same," and attempted to induce the consignees to accept by the extension of long-time credits and guaranteeing resale of such consignments and the assistance of the firm's salesmen in disposing of the

345,500,000 Bbl. Petroleum Marketed

WASHINGTON, Jan. 2—More than 345,500,000 bbl. of petroleum was marketed from oil wells and field storage tanks in the United States in 1918, according to a preliminary estimate made by the Geological Survey, Department of the Interior. This is a gain of 3 per cent over the output of 335,315,801 bbl. in 1917. The surface reserve of crude oil held by producers and pipe line companies at the end of this year was estimated at 123,000,000 bbl., compared with 150,000,000 bbl. at the end of 1917.

—

Shipments of Tank Cars

WASHINGTON, Jan. 2—The oil industry shipped 505,685 tank cars of oil and oil products from the mid-continent field between Jan. 1, 1917, and Nov. 1, 1918, according to figures made public by the Railroad Administration yesterday. Between April 20 and November 30, 1918, 3585 solid trains of tank cars moved from the Middle Western field, totalling 100,530 cars.

—

Exports to Greece Simplified

WASHINGTON, Jan. 3—A simplified procedure for handling applications for licenses to export to Greece has been arranged by the War Trade Board. None of the many supplemental sheets will be reuired hereafter, as the particulars of the applications will not have to be sent to the War Trade Board representative in Greece. Licenses for shipments to Greece will be valid until used or revoked and can be used for shipments either direct or indirect and without restrictions as to the flag under which the same is carried.

Oil and Gasoline Production Normal

Stocks Show Slight Decrease in October, But Ten Months' Figures Are Satisfactory

PRODUCTION

	October, 1918	September, 1918
Crude oil (bbl.)	29,237,767	28,390,431
Gasoline (gal.)	314,251,318	314,595,959

	Stocks on Hand Oct. 31, 1918	Stocks on Hand Sept. 30, 1918
Crude oil (bbl.)	15,438,756	14,462,100
Oils purchased to be re-run (bbl.)	1,308,744	1,312,275
Gasoline (gal.)	250,328,329	269,722,723
Kerosene (gal.)	419,409,944	436,628,907
Gas and fuel (gal.)	596,116,351	583,407,769
Lube. (gal.)	135,196,542	147,425,556
Wax (lb.)	195,797,590	181,044,508
Coke (ton)	23,905	16,866
Asphaltum (ton)	74,159	79,424
Miscellaneous (gal.)	457,222,127	444,353,139

NEW YORK, Jan. 6—Figures dealing with the output of oil refineries and stocks on hand for October disclose that both production and amount available are around normal, when compared with the totals for September. Production of crude oil has increased from 28,390,431 bbl. in September to 29,237,767 bbl. in October, but the production of gasoline has decreased from 314,595,959 gal. to 314,251,318 gal. The drop in gasoline is so small as to be almost negligible and is in all probability more than compensated for by decreased consumption.

Another factor which will tend to relieve the gasoline position is that smaller quantities of special spirit for aircraft will be needed, even although an increase in the amount required for aircraft employed in postal and commercial service may be expected. Taking gasoline on a daily production basis the average for 10,486,532 gal. per day for the 30 days of September may be compared with the 10,137,139 gal. per day for the 31 days of October.

Gas and fuel oil figures show a substantial increase for the 10 months of 1918, and the production for October was greater than for any other month in the ten. It is apparent that every effort will be made to accumulate a reserve of fuel oil to meet the demands of our new oil-burning merchant marine.

—

British Petroleum Prices Amended

WASHINGTON, Jan. 3—The London Board of Trade has arranged new wholesale prices for petroleum products effective Dec. 16, as follows:

Gas oil in bulk at wharf 17 cents per imperial gallon (1.2 United States gal.)

Fuel oil in bulk at wharf $48.67 per ton.

From Jan. 1, 1919:

Spirit in cans—aviation, 77 cents; special boiling points, 72 cents; No. 1, 70 cents; No. 2, 68 cents; No. 3, 66 cents.

Kerosene—long-time burning oil, in bulk, 30 cents; No. 1, 30 cents; No. 2, 28 cents. Raw white spirit ungraded and unrefined, to manufacturers, 55 cents.

All of the above, excepting where otherwise specified, are per imperial gallon, which is equal to 1.2 U. S. gallons.

—

Exports to Belgium

WASHINGTON, Jan. 2—Any commodity destined to Belgium and the Belgian Congo, excepting those included in the present War Trade Board Export Conservation List, can be shipped without application for a license under special export license RAC-65. It is only necessary for shippers to note on the package if it is shipped through the mails or on the export declaration, if shipment is made by express or freight the following:

"Shipped under special export license RAC-65."

Name and address of shipper.

Name and address of consignee.

Statement of contents.

There are no automotive products listed on the Export Conservation list.

New York Truck Show Space

(*Continued from page 70*)

modated, although the bulk of the space for parts and accessories already has been contracted for.

The M. A. M. A. relation to the show is not as is commonly called a "sanction." The M. A. M. A. does not sanction shows. It "participates" in them. It buys a block of space and sells it to its members. Or, as in this case, it takes a neutral attitude and is agreeable to exhibiting by any member who cares to do so, except that the member buys space from the show manager and not from the M. A. M. A. The M. A. M. A. buys a block of space at Boston and Chicago. The net result, however, is the same, and the M. A. M. A. is co-operating wherever possible with the New York dealers.

At one time there were rumors of friction, but it has all gone now. The success of the show is more assured now than ever.

A big N. A. D. A. meeting is planned for Feb. 5. Prominent men will speak. The show management requests dealers who plan to come to New York to send in requests for seats at this noon-day luncheon as there may be difficulty in getting a banquet hall large enuogh. It is planned to secure a luncheon at reasonable rates.

Expect Keen Bidding for Army Planes

HOUSTON, Jan. 4—There promises to be keen competition in bidding for the purchase of the 1200 airplanes and 2000 airplane engines, now stored at Houston, which the Government has announced it will sell on Feb. 1. Many of the men who will put in bids for airplanes are former army flyers, who want the machines for their private and business use. All bids will be opened at the office of the salvage branch, supply section, office of the director of military aeronautics, Washington, D. C.

The bids will be accepted on the plan of cash down before delivery, f.o.b. cars in Houston, and delivery promised within ninety days from the day the bid is accepted. Each bid must be accompanied by a check for 20 per cent of the proposal, and the Government reserves the right to reject any or all bids and also reserves the right to accept the bid on the unit basis. Bids will be accepted for one or more of the airplanes and the same applies to the airplane engines.

Chicago Accessory Space Allotted

CHICAGO, Jan. 6—Space for the nineteenth annual motor show in Chicago has been allotted to its members by the Motor and Accessory Manufacturers' Association, both for the passenger car exhibition, Jan. 25-Feb. 1, and the truck, Feb. 3-6. Ninety-five spaces were assigned for the former dates and fifty for the latter. Sam Miles, manager of the show, also has on file applications for space from forty manufacturers of accessories who are not members of the M. A. M. A.

American Forging to Meet

PONTIAC, MICH., Jan. 7—The annual meeting of the stockholders of the American Forging & Socket Co. will be held Jan. 15. Action to increase the capitalization from $250,000 to $350,000 is contemplated, and a resolution advocating the increase will be submitted to the board of directors to be chosen at that meeting. On Dec. 30 a 6 per cent dividend was declared. This is payable in four equal instalments of 1¼ per cent on Jan. 15, April 15, July 15 and Oct. 15.

Copper Production Increases

WASHINGTON, Jan. 2—Copper production in the United States in 1918, although slightly larger in quantity, showed a decrease of nearly $40,000,000 in value compared with 1917 figures.

At an average price of about 24.75 cents per lb. the 1918 output had a value of $473,000,000, as against $510,000,000 for the previous year, according to a report of the United States Geological Survey just made public.

Production of blister and Lake copper was 1,910,000,000 lb., as against 1,886,000,000 lb. in 1917. The supply of refined copper aggregated $2,450,000,000, compared with $2,362,000,000 during the year before.

Imports of copper in all forms during the yearly period amounted to 535,868,000 lb., and the exports totalled 1,126,082,000 lb.

Arizona, Montana and California mines showed an increase of production, while those of Michigan, Utah, Nevada and New Mexico fell below the 1917 output.

Nineteenth Used Car Market Report Out

CHICAGO, Jan. 8—The Nineteenth Edition of the National Used Car Market Report has just been issued by the Chicago Automobile Trade Association. It shows "as is" sales from June 21 to Nov. 21, and gives appraisal prices for December, January and February. To the long list of car names, representing both modern and ancient automotive history, have been added the names Bell and Templar. In the case of the Bell no figures are given, as only a 1919 model is listed and there has been little sale of used cars of this make. The same applies to the Templar, of which 1919 touring and roadster models are listed.

Samples Can Be Exported

WASHINGTON, Jan. 2—Samples can now be exported by mail, freight, express, in passengers' baggage or otherwise without individual export license. The new ruling issued to-day by the War Trade Board also authorizes the export without individual licenses of advertising matter to be used in connection with samples. The term "samples" is construed to mean any articles intended for use in soliciting orders but not to include any article intended to be sold as an article of commerce. It is necessary to note on the package of the sample if the shipment is made through the mail or on the export declaration, if the shipment is by mail or express:

"Shipped under Special Export License No. RAC-55."
The name and address of the shipper.
The name and address of the consignee.
A statement of contents.

The attention of exporters is called to the fact that the use of this special license number does not relieve the shipper of the responsibility of complying with the import restrictions of the country of destination. For example, exporters are advised that at present the customs restrictions of the United Kingdom forbid the entry into that country, as samples of motorcycles, auto-peds and complete motor cars. Other countries have similar restrictions and exporters should determine first what the restrictions are.

N. A. C. C. Takes Up Peace Problems

NEW YORK, Jan. 8—To-day's meeting of the Board of Directors of the National Automobile Chamber of Commerce extended an invitation to C. C. Hanch, chief of the Automotive Products Section of the War Industries Board, to visit the European countries to investigate automobile conditions in connection with the export trade of American manufacturers. While in Paris he will attend the Inter-Allied meeting called by the Chambre Syndicale des Constructeurs d'Automobiles as the representative of the automobile industry, to discuss custom rates, shows and other matters of international importance. Representatives of England, Italy and Belgium will also attend.

The traffic committee's report showed that the automobile industry is slowly getting back into production, although carload shipments for December were only 8210 as compared with 15,827 carloads in December, 1917, which is 51 per cent of normal. N. A. C. C. traffic officials reported on their meeting with the Packing Service Branch of the War Department, which is developing new methods of loading automobiles in freight cars, to permit the easier handling of vehicles with economy of space. The Packing Service Branch is establishing specifications for packing and loading articles of all kinds and the industry will co-operate with it in handling automobiles.

The meeting discussed the question of locking devices with a view to giving added safety to motorists from car stealing, which is becoming so prevalent. A complete investigation will be made and reports given to automobile manufacturers.

New standards for tires were considered, the plan calling for a continuance of the making of tires for all rims in use, but providing that after Jan. 1, 1920, the manufacturers will equip their cars with certain sizes that are being considered. Pneumatic sizes will run from 30 x 3½ to 36 x 5 for passenger cars and for trucks 36 x 6 to 40 x 8. There will be fourteen pneumatic sizes in all. Truck sizes call for fifteen sizes of solid tires. The whole program is expected to make for greater efficiency in manufacturing and the certainty of dealers' stocks being complete without being too heavy.

It is reported that Canada has virtually raised the embargo on the importation of motor cars by freely granting licenses for their importation into Canada.

The N. A. C. C. will hold a convention of motor truck manufacturers during the week of Feb. 10, coincident with the motor truck show in Madison Square Garden in New York, when standardization, sales and other plans for the industry will be discussed.

New Apperson Export Model

KOKOMO, Jan. 9—The Apperson Bros. Automobile Co. will shortly make public the details of a new moderate-priced model especially adapted for export trade. The company has arranged to maintain its export headquarters with C. T. Silver, Inc., former Apperson distributer for the Metropolitan territory. The export department will be in charge of Geo. H. Strout who henceforth will make his headquarters in the Silver establishment at 100 West 57th Street, New York.

Rules for Ending Contracts

Method of Procedure Outlined by Lt.-Col. Blyth—Individual Forms Available

WASHINGTON, Jan. 2—Instructions to manufacturers for the termination of contracts for war materials have been compiled by Lt.-Col. L. W. Blyth, Chief of the Settlements Division of the Purchase, Storage and Traffic Division, United States Army. The instructions include directions for making:

1—Inventory of unworked direct materials.

2—Inventory of indirect materials.

3—Inventory of worked direct materials.

4—Inventory of direct labor and overhead expense.

5—Statement of scrap from worked materials.

6—Commitments for materials.

7—Claim for other compensation.

8—Recapitulation sheet.

9—Statement of claim.

Following is the complete list of instructions. Individual forms will be furnished to the manufacturers.

Instructions to Contractors in Preparing Claims Based Upon the Suspension or Cancellation of Contracts.

1. For the purpose of submitting claims under contracts, contractors will be furnished with the following forms: Finance Form No. 1, Inventory of Unworked Direct Materials; Finance Form No. 2, Inventory of Direct Materials; Finance Form No. 3, Inventory of Worked Direct Materials; Finance Form No. 4, Inventory of Direct Labor and Overhead Expense; Finance Form No. 5, Statement of Overhead Expense; Finance Form No. 6, Statement of Scrap from Worked Materials; Finance Form No. 7, Commitments for Materials; Finance Form No. 8, Claim for Other Compensation; Finance Form No. 9, Recapitulation Sheet; Finance Form No. 10, Statement of Claim.

2. Wherever it is possible and practicable for the Contractor to fill out the forms submitted, the information should be furnished accordingly. When impracticable to use these forms, the information should be presented by the contractor in such a manner as may be approved by the settling authorities and as will allow of proper examination and determination. As all claims presented by contractors will be subject to complete verification before full reimbursement is made, unusual care should be taken in the preparation of any statement.

3. The heading on each form should be filled out to show the proper official title of the contracting firm or corporation as it appears in the contract; location of the plant and general offices; Department of the Army which issued the contract, such as Ordnance, Quartermaster, Signal Corps, etc.; contract or order number; name of the article contracted for; the number of each sheet, sheets to be numbered consecutively according to classification; date on which work was actually stopped; and date inventory was actually taken.

4. The quantities shown in the inventory should not be in excess of that required to finish the contract.

5. The following brief explanation of the use of each form is given for the guidance of contractors in their preparation:

Inventory of Unworked Direct Materials

After the term "classification" on this form the particular class of material as purchased should be shown. This material may be either raw material, such as steel, copper, brass, etc.; or it may be in the form of component parts purchased, such as forgings and castings of a particular pattern, copper bands, wheels, axles, transmissions, etc. For each class of material, as above stated, a separate sheet should be prepared. Only such component parts as have not entered into process of manufacture should be detailed on this form.

In the body of the form, under the heading "Full Description of Material, Name of Suppliers (Vendors)," such detailed information should be listed as may be necessary to easily identify the item in question. In the proper columns there should be entered the date upon which the item in question was actually received by the contractor; the quantity thereof; the unit of quantity, such as yards, pounds, tons, etc., and the cost of each unit (inclusive of freight). The last column should show the total amount of each item.

Inventory of Indirect Materials

On this form should be inventoried claims for all materials purchased and on hand at contractor's plant to be used in connection with the manufacture of the articles under the contract, but not to become a part of the articles themselves. Examples of indirect materials are oil, grease, waste and sundry factory supplies. Separate sheets should be prepared for each classification of such indirect materials, in the same manner as in the case of Unworked Direct Materials, previously explained. The body of the form should be filled out in the same manner.

Inventory of Worked Direct Materials

On this form should be inventoried all raw materials and component parts purchased which have actually entered into process of manufacture and have had labor and overhead expended upon them. It will not be necessary to classify this material as in the case of Unworked Materials, inasmuch as it is all to be listed as component parts of the articles to be manufactured.

Expenses, Direct Labor and Overhead

The purpose of this form is to show the direct labor and overhead applicable to the Worked Material as shown on the preceding form.

If it is impracticable to apply the amount of direct labor and overhead against the individual items as listed on the preceding form. The items need not be set forth at length, but the form should show the total amount of direct labor and overhead applicable to the Worked Materials as a whole.

Statement of Overhead Expense

The purpose of this form is to establish a rate of overhead to be applied to work in process on the basis of direct labor. This overhead rate is to be established on a basis of the contractor's overhead expenditures for a period of three months preceding the date of cancellation of the contract. The expense accounts should be listed on this form to show classification and amount. The total amount of direct labor on all contracts is to be ascertained for the same period as stated for the overhead. In order to obtain the percentage of overhead to be added to direct labor the total direct labor should be divided into the total overhead. For instance, if the direct labor for the period amounted to $16,000 and the total overhead for the same period amounted to $14,000, $16,000 divided into $14,000 would show a percentage of 87.5, which would be the rate to use.

In the majority of cases it is assumed that only one form sheet will be needed to list the expense accounts, and the form therefore provides for totaling such accounts, setting up the total direct labor on the line next below and showing the rate obtained. Where the expense accounts are too numerous to be listed on one sheet, the total may be carried forward to additional sheets and the direct labor and percentage shown only on the last sheet used.

Where the contractor has an established system for distributing overhead, this system may be used in connection with the Government contract, in so far as it may be applicable. In certain instances, it may be impracticable to distribute overhead on the basis of direct labor, and in such instances other equitable methods may be employed. In any event, the method used should be clearly set forth on this form, in the columns expressly provided therefor.

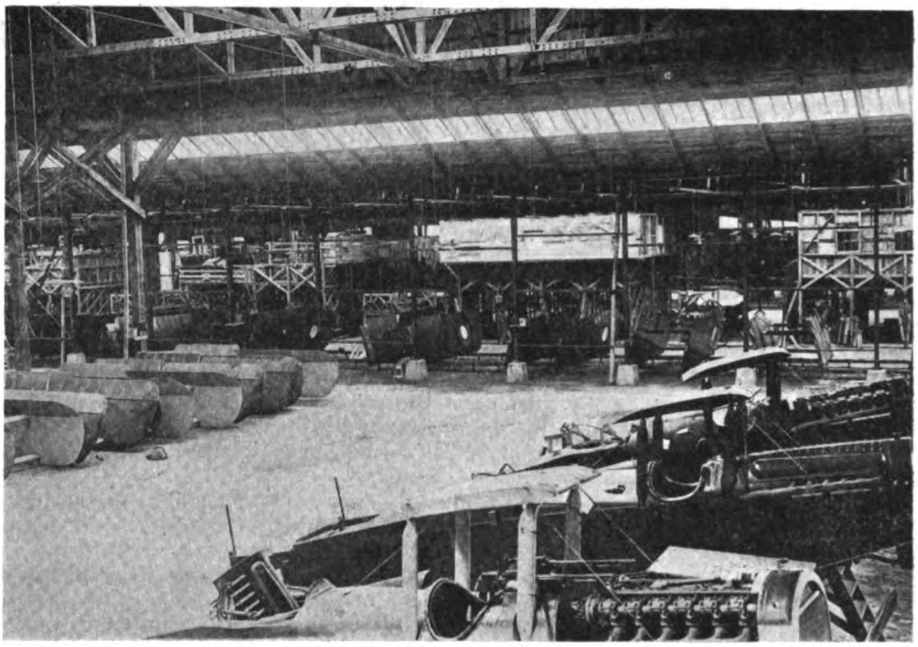
Items of overhead expense should be in accord with Ordnance Department pamphlet entitled "Definition of 'Cost' Pertaining to Contracts," a copy of which will be furnished contractors. In no event should expense accounts be listed which bear no relation to the department or departments of contractor's plant wherein the contract is performed.

Statement of Scrap from Worked Materials

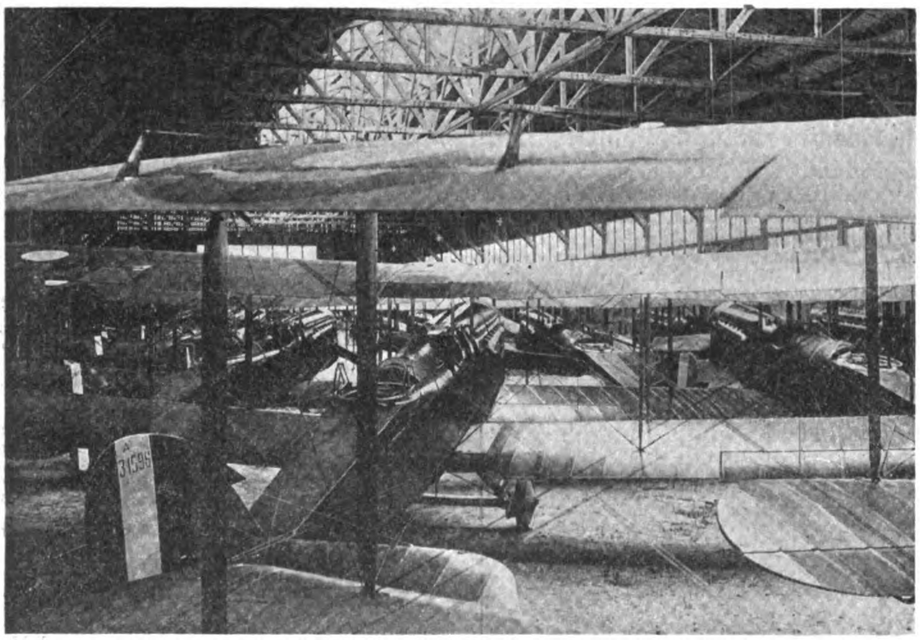
In cases where contractors make claim for the gross value of all raw material or

(Continued on page 77)

French Liberty Plane Depot



This Liberty plane depot, which is at Romorantin, is the largest assembly plant in France. This photograph was taken Nov. 11, 1918



The Romorantin Liberty plane assembly plant, of which this is another view, is located 180 *miles from Paris*

Fly From England to India

PARIS, Dec. 18—*By mail*—For the first time the journey from England to India has been completed by airplane. The trip which ended at Karachi, India, on Dec. 17, was made in a Handley-Paige bombing plane equipped with four Rolls-Royce Eagle engines and was piloted by Maj. A. S. MacLaren and Captain Halley. The total mileage was close to 6000 and was made in a number of stages varying in length from 652 to 1170 miles.

Two Long Seaplane Flights

NEW YORK CITY, Jan. 4—Two long flights in navy seaplanes have recently been completed, one from the Naval Air Station at Pensacola, and the other from Norfolk, Va. Lieut. T. C. Rodman, U. S. Marine Corps, on Dec. 30 flew 900 miles from the Pensacola station, carrying eleven passengers. The same day Lieut. Commander Bollinger, U. S. N., covered a distance of 651 miles from the Norfolk station without stop, carrying five passengers.

Altitude Record Now 30,500 Ft.

NEW YORK CITY, Jan. 4—A new world's record for altitude has been made by an American pilot flying a British plane and carrying one observer. On Jan. 2 Capt. Lang, R.A.F., attained an altitude of 30,500 ft. in 66 min. 15 sec. The best previous record was made by Capt. B. W. Schroeder, an American pilot, who reached an altitude of 28,900 ft. on Sept. 10, 1918, at the Wilbur Wright Aviation Field at Dayton.

Rickenbacker Again Cited

PARIS, FRANCE, Jan. 4—(Special Cable)—Capt. Edward Rickenbacker, foremost among American aces, has won further distinction. He has been awarded the French Legion of Honor in recognition of his military services.

Mexico May Remove Import Duty

MONTEREY, MEXICO, Jan. 4—Assurances have been received here from the City of Mexico that the Federal Government will issue a decree soon removing all import duties on automobiles, motor trucks and other motor vehicles. In anticipation of this being done arrangements are being made for a great expansion of the automobile trade in all the principal cities of the country. While the actual orders for motor vehicles of various lines will not be placed until the decree is issued, dealers and others are making up lists of their possible requirements in these respects and the purchases will be made with a rush when the duties are removed. It is expected that dealers in El Paso, San Antonio, Laredo, Eagle Pass and Brownsville will profit largely as a result of the proposed new decree. While during the last several years there has been a more or less continuous and large trade in used automobiles in Mexico, the time has arrived when the demand for new cars must be filled. This is true, it is stated, as to motor trucks. With a revival of mining and other industries in this country motor trucks are rapidly coming more and more into use. It is largely a virgin field for that trade and offers enormous possibilities in the way of expansion, according to American dealers who have been investigating the situation here.

Chandler Prices Revised

CLEVELAND, OHIO, Jan. 6—The Chandler Motor Car Co. has revised its prices as follows:

Model	New Price	Old Price
7-pass. tour	$1795	$2095
4-pass. road	1795	2095
Sedan	2495	....
Coupe	2395	....
Limousine	3095	....

Summary of Business Conditions as of Date Nov. 23, 1918

The following summary of general business conditions in the United States is compiled from reports received by the Federal Reserve Board from the twelve reserve bank districts:

District.	General business.	Crop condition.	Industries of the district.	Construction, building, and engineering.	Foreign trade.	Money rates.	Railroad, post office, and other receipts.	Labor conditions.
No. 1—Boston.....	Hesitating......	....	Busy...........	Increase in value..	Decrease........	Firm...........	Post office receipts mixed.	More plentiful.
No. 2—New York..	Volume decreasing, except retail sales; profits decreasing; collections good.	Good..........	Reduced activity; many orders canceled.	Normal seasonal inactivity; outlook improved by removal of Government restrictions.	Stimulated interest; some uncertainty.	Slightly lower...	Increase..........	Very little shortage since armistice was signed.
No. 3—Philadelphia	Very good.......	....do.........	Very busy.......	Building at low ebb, but prospects bright.	....	Continue firm...	Increasing........	No labor disturbance expected.
No. 4—Cleveland..	Satisfactory.....	....do.........	Busy...........	Inactive..........	....	Tendency to increase.	Increase..........	Scarce.
No. 5—Richmond..	Resuming activity after effects of influenza.	Tobacco active at high prices; cotton held for 30 cents.	Limited only by supplies and labor.	Preparations being made to resume activity.	Inactive........	Active demand, 6 per cent.	Railroad facilities improving post office in full volume.	Thought to be improving.
No. 6—Atlanta....	Satisfactory.....	Good..........	Continue active..	Very quiet........	Quiet...........	Stationary......	Stationary........	Fair.
No. 7—Chicago....	Good but reflecting conservatism.	Excellent.......	Active.........	Dull but showing improving tendency.	....	Firm at 6 per cent.	Post office receipts decrease.	Scarce and restless.
No. 8—St. Louis...	Good..........	Winter wheat excellent.	Readjusting to peace basis.	Quiet............	....	Firm...........	Increase in postal receipts.	Improving.
No. 9—Minneapolis	....do........	....	Slowing down...	Slow.............	....	....do.........	No change........	Good.
No. 10—KansasCity	Continues active.	Condition normal; outlook excellent.	Active..........	Dull but promising revival.	Heavy on meats.	Firm, 6 to 7 per cent.	Heavy...........	Recovering from influenza.
No. 11—Dallas....	Satisfactory.....	Condition good; outlook promising.	....do.........	Inactive..........	Increase in October.	No changes; firm at 6 to 8 per cent.	Railroad increased; post office 21.8 per cent increase in October.	Unsettled and unsatisfactory.
No. 12—San Francisco.	Volume large, collections good.	Good..........	....do.........	Decreased; new projects under consideration.	Increasing......	Firm and stationary.	Increasing........	Full employment.

Contract Termination Instructions

(*Continued from page* 75)

purchased components put into process of manufacture, the United States is entitled to scrap resulting, and credit for the full market value of such scrap must be given by contractors in preparing final statement of claim.

The scrap resulting from or applicable to materials in process of manufacture must be determined as accurately as possible and reported on this form. Care should be taken that separate classes are separately reported.

It is appreciated that in many instances it will be impossible to physically separate the particular scrap applicable to material in process. Where this is the case, it must be accurately estimated and full credit given, as contractors will be held strictly accountable for the proper proportion of scrap.

Commitments for Materials

This form is to be used to list purchase orders for materials for use on the contract which have not yet been invoiced to contractor by the supplier, but represent commitments on account of which contractor desires to make a claim. It is very important to show the name of the supplier in each instance, as well as a full description of the materials ordered. Classification is required as in the cases of material inventories and a new sheet should be used for each classification.

The date on which the order was given, together with full description of the quantity ordered, unit price and total amount, should be fully set out in the case of each item.

Claim for Other Compensation

In addition to claims based upon inventories and commitments, claims may be made by contractors to compensate for losses actually incurred by them on account of the termination before completion of a contract with the United States.

Contractors who contemplate making claims against the United States for losses incurred by them on account of termination of contract are advised that in every case conclusive evidence must be furnished. It is not sufficient that a contractor show cause for loss, but must submit proof of actual loss sustained.

Contractors are required to submit claims on this form, and support such claims by clear proof, documentary where possible, to the full satisfaction of the board or other agency of the United States having jurisdiction.

In adjusting a claim for other compensation with the prime contractor, in which there is included a settlement with sub-contractors, it will be necessary for the prime contractor to furnish proof of adjustment and settlement of sub-contractor's claim prior to payment.

Recapitulation Sheet

This sheet is to be used to recapitulate and tie together the various inventories and statements, and to avoid the necessity of a large number of signatures, certificates, etc.

A recapitulation sheet should be used in connection with each inventory or statement where more than one sheet is required. In making up inventories and statements, totals should not be carried forward from one sheet to the next, but should be posted to the recapitulation sheet and the final total of each inventory or statement obtained by totaling the amounts appearing on such recapitulation sheet.

On the reverse side of this form appear the various certificates which will be required before payments may be made on account of the various claims. Not all of these certificates will be required in every instance, but a person duly authorized by the contractor must sign the contractor's certificate in the case of every inventory or statement. The other certificates are for signature of War Department officials and will be filled in at a later date when required.

Statement of Claim

This form is prepared for the final presentation of contractor's entire claim to such board or other agency as may have authority to hear and determine it.

As explained on the face of the form, it is, in effect, a final recapitulation of all the elements of the claim as set forth on the various forms previously referred to.

It is not expected that in all instances contractors will make claim for the full amount of inventories and other items set out and in such cases proper deductions may be made on the face of this form, accompanied by a clear and concise explanation thereof.

On this form should also appear all proper deductions for advances previously made to contractors by the United States in connection with the contract upon which claim is made.

The final balance appearing on this form should represent the contractor's net claim on account of the suspension or termination of his contract.

On the reverse side of the form will be found the certification and affidavit required in connection with each contract, and these should be carefully filled out and executed before claim is forwarded.

General Remarks

1. Where a contractor has more than one contract with the United States, great care should be taken that claims on account of each are accurately separated and so reported, as all settlements will be made by contracts and not by contractors. A complete report must therefore be submitted for each contract, and in no case should inventories contain items to be used for more than one contract even though such contracts be for identical articles.

2. Material which is the property of the United States shall not be inventoried. Where advance payments have been made by the United States to contractors on account of materials, the title to such materials has passed to the United States and the contractor's claim for any balance due should be set up as a claim for other compensation on the form provided therefor.

3. One original and five copies of all papers must be forwarded to the Government agency having jurisdiction. Only the original should be signed; on the copies all signatures should be typed in.

4. Wherever these instructions cannot be followed to the letter, the greatest care should be taken to conform as nearly as possible. This is in the contractor's interest, inasmuch as claims properly prepared will be settled with the least confusion and delay.

5. Wherever it will be impossible or impracticable for the contractor to present his claim as set forth herein, he should immediately get in touch with the proper agency having jurisdiction in his district and assistance will be furnished him as rapidly as possible.

Commercial Aviation Here in Few Years

(*Continued from page* 71)

flying has taken, because in the past the people were very frightened of flying over bad country, continually worrying. I have done it myself, of landing in corn fields and like fields, woods and all sorts of things. Now with engines that one can rely on we feel absolutely confident that it will carry you through. The little machine will be cheaper in every way. It will, of course, not bring the same results with the one exception of speed, but it will always be the fast machine.

I think that it is an extreme case, but you might compare the big machine as you would compare an ordinary roadster to a bus, and I believe in the ordinary machine. I would certainly take it if I were going on a long trip from here to Chicago, preferring the roadster to the bus. The Atlantic will certainly be flown in the course of the next six months by more than one machine of the two, three and four passenger class.

Now, your country is full of young, keen, fully developed, wonderfully trained pilots. These people must have employment, they wouldn't want to give up flying either; there is no necessity for it. The future of aviation in the commercial sense will need every one of those men and you are a very lucky country to have such wonderful men trained and eager to fly.

While H. Snowden Marshall, who investigated the aircraft situation, was expected by the audience to say a lot about his investigation, he said little in detail. He stated that things were not as bad as painted and that the aircraft work done was a most creditable achievement. He also urged that the experience gained through the progress made thus far be not lost through a slump in aircraft development.

Lieut. H. H. Emmons, who was in charge of aircraft production, cited figures that reflect very favorably on the efforts of those engaged in aviation work during the war. He said:

For the eight years prior to 1916 the Army had ordered fifty-nine airplanes and had received fifty-four. During the year 1916 the Army had ordered 366 planes and had received 64. In other words, for the nine years prior to 1917 the Signal Corps of the Army had received the enormous sum of 118 airplanes. That was the equipment that they had had up to the date that we started this business and that was all that they knew about them. Now, from that we had to start with a program laid down by the joint army and navy technical board, calling for over 9,000 training planes and over 20,000 combating planes, and you gentlemen who have made any of this material know what it meant to tackle a job of that kind.

Now you made 9,000 of the training planes, you made the 16,000 training engines, and every one of them had been delivered and put into service, gentlemen, before the armistice was declared.

On the combat engine side we were oppressed with a multiplicity of advice; as a result of which it was determined to put our main effort upon the Liberty engine, going into the arguments for or against it. I am simply going to call your attention to this fact, that on the 19th day of May the first stroke of the pen was made to design the Liberty engine, the first engine was built complete and delivered in Washington on the fourth day of July, less than six weeks. It was extended into a 12-cylinder engine and the first one was built and passed the 54-hour test by the 25th day of August of that same year and was pronounced a success and ready for production.

We started to produce that engine, which was rated at a horsepower of 330. When we had tooled and jigged up for it and gotten the factory ready and had produced several hundred of them we were told to increase the horsepower. It was boosted to 375, with the resulting changes in the tools and equipment. When we had made some four or five hundred of them we received our final instructions from abroad, and I might say to you that most of the things you have felt disposed to criticize you will find were done by us because we were told by the authorities under whom we were working that that was what was wanted, and that we should do it.

We received our instructions from the other side that if we could produce an engine of 400 horsepower or upward we would have the engine that would do wonders in 1917 and 1918. Many changes were required to get that larger engine, and on the 29th day of May, 1918, one year after this engine was started to be designed, we had passed all those difficulties, had engineered and developed it, put it into a manufacturing proposition and delivered into service over 1100 of them.

Now that is an accomplishment that never has been equaled in industry anywhere. Those of you who are familiar with the automobile business know that no automobile motor of any size or strength has ever been put into service without at least a year of experimentation and development on it. This Liberty engine had no such year of development before it was put into production, and it did not need it, for the reason that the design was proper when it was made. You have heard about changes on that engine. From the date it has been made until now there have been no fundamental changes on that engine. We have changed the oiling system, but there aren't any fundamental changes.

The changes that you have heard about are of two classes: We know those were required by the two increases in horsepower that I have told you of, and the other the manufacturing changes that always are discovered in the process of production. And those are all the changes that have been made on this engine during the time that it has been in production.

Now from the 29th day of May until the armistice was declared the production of these engines jumped by leaps and bounds, until, during the month of October, the production of Liberty engines was 3878, or over 150 for every working day in that month.

Otto Praeger, Assistant Postmaster General, told of the future that lay in the mail service for planes. He said great climbing ability and such things were not so much in demand as were landing ability and other peace-time qualifications.

Early in the evening a large number of flyers from overseas marched into the hall behind a "Spirit of '76" drum corps amid the applause of the diners.

The meeting also had as a feature the presence of Major Albert D. Smith and others who at 5.30 o'clock the same afternoon completed a trans-continental flight, begun Dec. 4, for observation and mapping purposes.

The banquet was presided over by President Frank H. Russell, of the association, and at the speakers' table were:

Major General W. L. Kenly, Chief of the Division of Military Aeronautics; Charles F. Kettering, president of Society of Automotive Engineers; Major H. Dourif, French Aviation Mission; Hon. H. Snowden Marshall, former U. S. District Attorney; Captain N. E. Irwin, U.S.N., Director Naval Aviation Division; Hon. W. C. Potter, Assistant Director of Aircraft Production; Henry A. Wise Wood, vice-president Aero Club of America; Dr. S. W. Stratton, secretary of Bureau of Standards; Hon. Grosvenor B. Clarkson, Director of Council of National Defense; Benjamin S. Foss, secretary Manufacturers' Aircraft Association, Inc.; Rear Admiral William S. Smith, attached to Naval Consulting Board; Hon. John D. Ryan, Brigadier-General J. D. Cormack, R.A.F., British War Mission; Rev. Nehemiah Boynton, D.D.; Colonel J. A. Mars, Director of Aircraft Production; Hon. Otto Praeger, Second Assistant Postmaster General; Lieut. Alberto Cantoni, Italian Military Mission for Aeronautics in U. S. A.; Lieut. H. H. Emmons, U.S.N., Chief of Engine Production Department, Bureau of Aircraft Production Col. William A. Bishop, R.A.F., D.S.O., V.C.; Harry Bowers Mingle, treasurer Manufacturers' Aircraft Association, Inc.

Studebaker Government Orders Canceled

SOUTH BEND, Jan. 8—It is understood that all of the Government business under order to the Studebaker Corp. has been canceled. This includes the chassis order for Great Britain as well as the other various orders for the United States.

To Complete Galveston Naval Airplane Base

GALVESTON, TEXAS, Jan. 8—It is authoritatively announced that the construction of the ten buildings that are to comprise the industrial group and three hangars of the hydroplane training station which the Government is to establish here will be started about Sept. 1. There will be no change in the original plans as a result of the signing of the armistice, it is stated. The proposed station will cost approximately $2,000,000. Considerable work in the nature of preparing the site for the proposed buildings has already been done.

The bulkheading and filling necessary to raise the site of the plant, which has been moved 1100 ft. east of the original location, to an elevation of 6 ft. above mean low tide, is one-half completed. One dredge is at work and another will be added this week.

The plant, when completed, will be made easily accessible by shell road and rail trackage from the main lines of the Southern Pacific. The men in training will be provided with hospital facilities and means of entertainment during their rest periods. The machines used will be of two sizes, the larger, or bombing planes, having a carrying capacity of six men, in addition to their guns and bombs, and the smaller ships, as their users call them, will carry two men and their fighting apparatus. The larger machines will have a spread of wing of 127 ft.

According to present plans, between twenty-four and thirty planes of the largest type in use by the Government and 800 men will be on duty at the station by the middle of the present year.

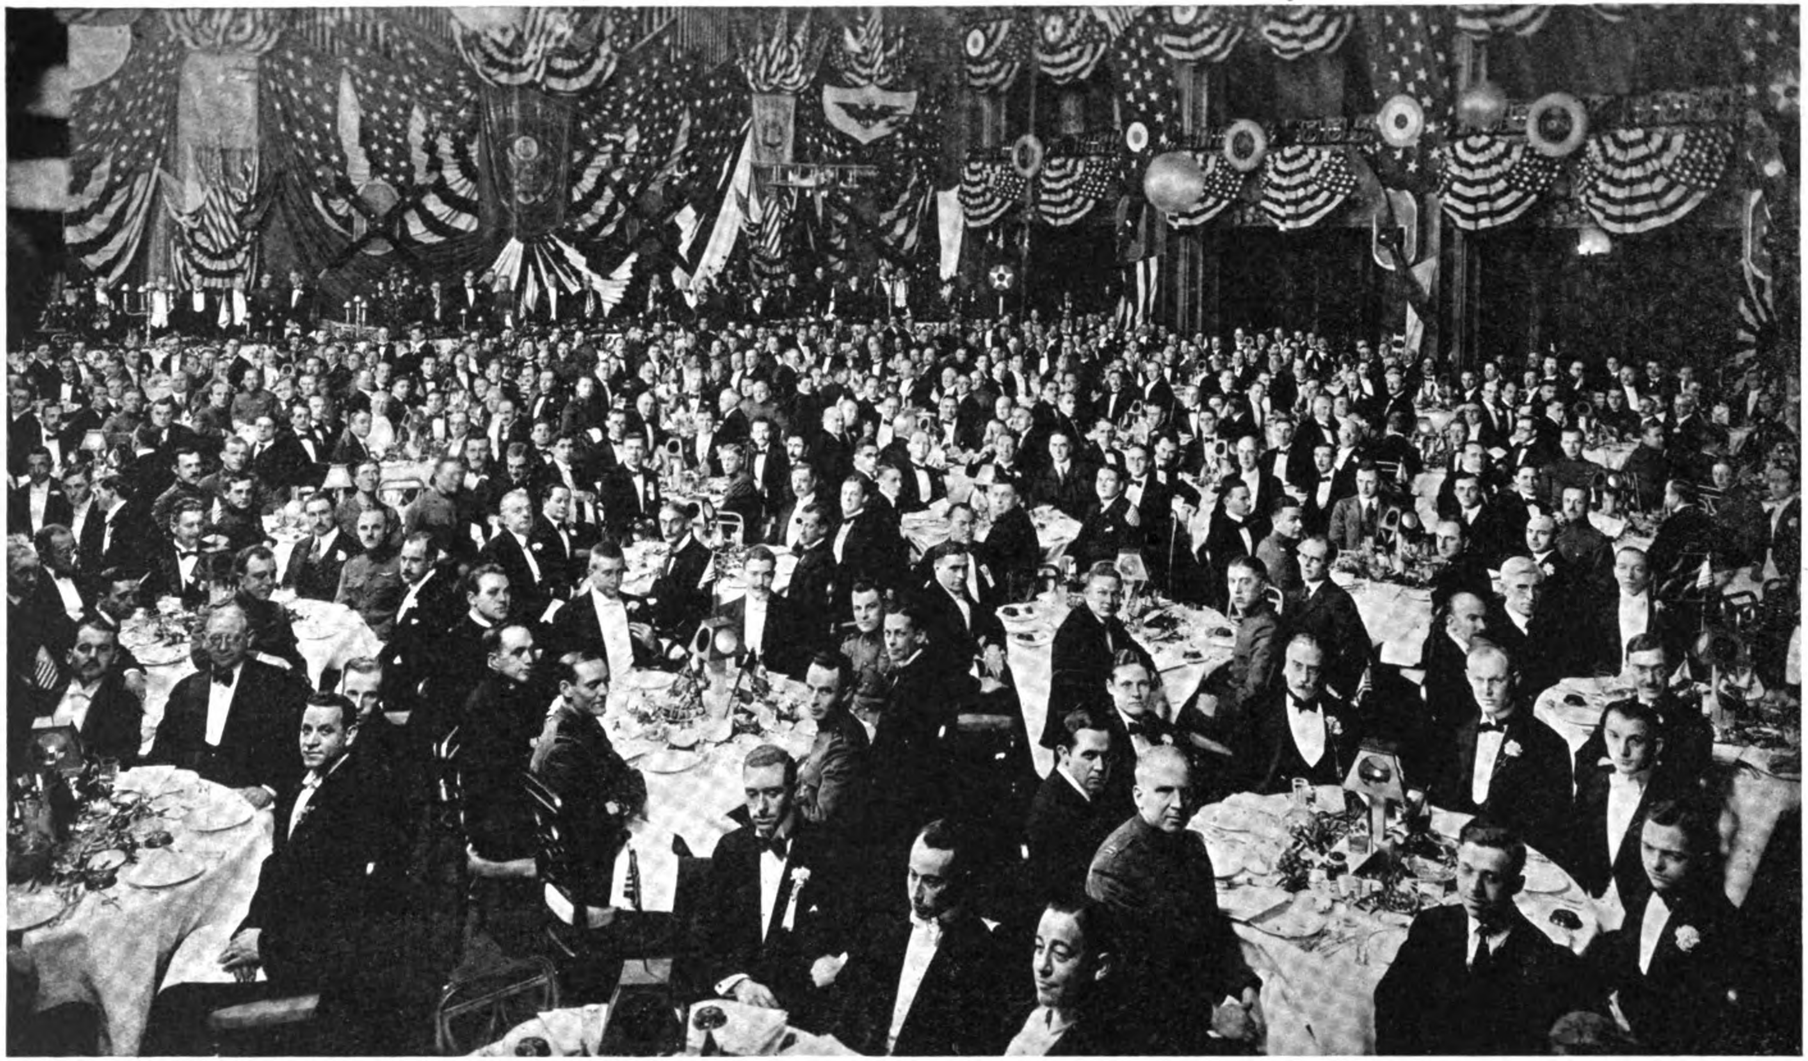
New Issue of General Motors Stock

NEW YORK, Jan. 8—Holders of Chevrolet common stock will be permitted to subscribe for a new issue of common stock of the General Motors Corp. at $118 a share. A holder of one share of Chevrolet stock will have the privilege of subscribing for one-tenth of one share of General Motors at the above price. A similar privilege will be accorded stockholders of the United Motors Corp. They are to be permitted to subscribe to the extent of one-fifth of the number of shares of General Motors common which will be received by the United Motors Corp. stockholders in the distribution of its assets based on holding of record Jan. 15. The price will be the same as to Chevrolet and General Motors stockholders.

No Empire 1919 Models

INDIANAPOLIS, IND., Jan. 8—The Empire Automobile Co. will not be in production with 1919 models, according to Charles B. Sommers, one of the financial heads of the concern. The lease on the 3-story plant in which the manufacturing activities of the company have been carried on expired in December and the company has not renewed it, as it is expected to lease or construct a building better suited to its needs.

Manufacturers' Aircraft Association Dinner, January 7, 1919



THERE were—somebody said—600 there. The diners represented many branches of aircraft manufacture and of the aviation branches of the army and navy. The flags of the Allies adorned the Waldorf-Astoria and an appropriate atmosphere was effected by numerous propellers, radiators, balloons and miniature planes. The miniature models, suspended everywhere, showed early types and late developments.

Graham W. Brogan will on Jan. 15 assume the duties of advertising manager for the Black & Decker Mfg. Co., Baltimore. He was formerly advertising manager for the Duesenberg Motor Corp.

—

Geo. H. Treviranus on Jan. 1 became sales manager of the Gemco Mfg. Co., Milwaukee. He succeeds L. A. Raash, who resigned to become affiliated with Walden-Worcester, Inc., Worcester, Mass.

—

A. H. Doolittle has been elected secretary and general manager of the Sunderman Corp., Newburgh, N. Y. He was formerly sales manager of the Zenith Carburetor Co.

—

F. C. H. Froesch has been made export manager of the American Rubber & Tire Co., Akron. He was formerly in the export department of the Firestone Tire & Rubber Co.

—

N. G. Rost, general sales manager of the Duesenberg Motors Corp., who has been in England and France for the past three months in the interests of the company, has returned and will take up his duties again at the 120 Broadway, New York, office.

—

Joseph P. Ripley, who has been in charge of the Fisk Rubber Co.'s Government sales at Washington for the past year, and was also Baltimore district manager, has been promoted to central district manager for the same company. The central district is one of the largest in the sales organization of the Fisk company, including twenty direct branches. Its headquarters are at Chicago, and it comprises the States of Illinois, Indiana and parts of Wisconsin, Iowa and Kentucky. Mr. Ripley succeeds Claude Platt, who has been appointed special factory representative.

—

Estep Died Doing His Duty

NEW YORK, Jan. 7—Estep was a part of American automotive history. Estep, Harry Perry and Herbert Stephens were co-editors of *The Automobile* when that publication was started in 1902. At one time he was editor of *Motor Age*. He was later advertising manager of the Packard Motor Car Co. and later with the Cheltenham Advertising Agency. He went "over" for *Leslie's*.

Editor AUTOMOTIVE INDUSTRIES: The mere fact that Ralph Estep had "gone West" in the final days of the fighting in the Argonne has been known among his friends for some time, but all details have been lacking. The following letter from my son, Herbert Stephens, 303d Engineers, with the accompanying clipping, furnishes the missing information. After working about Verdun and in Serbia two years ago as a war photographer for *Leslie's*, and doing the same work on this side throughout the different cantonments, Estep was serving in the Signal Corps of the A. E. F.

To those of us who know his high ideals of journalistic duty it will seem a mere matter of course that he sacrificed his life to them, and our sorrow will be tempered by the realization that "Esty" has "made good."—W. P. Stephens, 145 West 32nd Street, Bayonne, N. J.

Dear Dad: I am really crowding things by writing *you* at this time, as this letter should be addressed to Eleanor or Mother, but it is a special one prompted by my noticing the enclosed clipping in *The Stars and Stripes*. You can imagine how surprised and shocked I was to see it. Evidently Lt. Estep was in some way or other connected with our outfit, or one working in liaison with us, as we were working in that sector at the time he was killed. He, no doubt, passed within a short distance of me on his way up to the line, as the majority of the troops went up the main road on the last drive, of which I wrote you. We did not get as far as Sedan, as we were relieved by another division which carried on the work we had started; Lt. Estep was evidently with these men.

From all events he certainly died game, working right up till the last minute; there was a lot of this done, and in many cases the real stories of these men will never be told. For this reason the layman does not realize that a soldier does not necessarily mean a man who rushes madly ahead with either a loaded rifle or a bayonet and has a hand-to-hand fight with the enemy; for example, the infantry and artillery would be entirely lost without the work of such men as Lt. Estep, and in a good many cases these men are exposed to much greater danger and hardships and stand a much smaller chance of being recognized when it comes to writing up the story of the battle, as naturally their work is not as spectacular as that of a body of men working together.—Private Herbert Stephens, Company A, 303d Engineers, American Ex. Force, Venaray, 20 miles N. E. of Dijon, Dec. 3, 1918.

From The Stars and Stripes of Nov. 29, 1918.—"In the dark room of a photographic laboratory near Paris this week, two sensitized gelatine plates gave up the secret of the last minutes of Lt. Ralph Estep, who was killed within sight of Sedan after he had faced death almost daily for three months so that millions of people could see through the eye of his camera what modern war is like.

Gradually taking on lights and shadows, the two plates showed the crest of a barren hill, with shells bursting and casting up great spouts of earth, and, just beyond the crest, a valley black with the shadows of the late afternoon, a valley that holds Lt. Estep's grave.

Lt. Estep had snapped the photographs a few moments before another one of those big shells burst and left him lifeless at the side of his camera and plate pack. That was about 5 p. m. of Nov. 7, three days before the last guns of the war were fired. A dozen pencilled lines in his notebook, titles for the dozen pictures he had taken just before he was killed, make complete the story that the last photographs tell. He had written titles for every plate by numbers, and Plates Nos. 1, 2, 3, 4 and 5 showed the platoon forming for the reconnaissance. Plate 6 pictured a "slight brush," the first sight of the enemy.

The dramatic climax was shown in Plates 11 and 12, his last ones, and in his notebook the record stands:

"11 Burst. Killed."

"12 men crawling."

The pictures were all taken on a cloudy day and are full of shadows, with little contrast, and No. 11 shows only the edge of the hill and the huge, funnel-shaped shell burst. The word "killed" probably referred to what he had seen happen to the men just ahead of him. Picture No. 12 shows another huge column of flying earth with a line of doughboys dimly silhouetted against the darkness of the valley. The last writing on the page—the lieutenant's last words—were simply "Nov. 7 Pack 46." Lt. Estep had re-loaded his camera just before he fell.

Men of the Industry

Changes in Personnel and Position

Maun Joins Republic

ALMA, MICH., Jan. 3—W. E. Maun has been appointed chief assistant to G. R. Wilbur, director of purchases for the Republic Motor Truck Co., Alma, Mich., succeeding C. V. Marshall. Mr. Maun will have charge of production purchases.

Corporal Raymond Drown, son of J. W. Drown, advertising manager of the Standard Roller Bearing Co., is reported killed in France under sad circumstances. It appears that the engineering corps of which he was a member was for over 150 days under fire without losing a man. Corporal Drown was killed after the signing of the armistice while engaged in removing mines laid by the Germans to trap tanks.

—

Henry L. Hornberger has been made general sales manager of the Globe Rubber Tire Mfg. Co., Trenton, N. J. He will have his headquarters at the executive offices in New York. He was tendered a farewell luncheon Dec. 31, when he left the George Batten Co., with which he had been connected for some time.

—

Clarence A. Nelson, vice-president of the Nelson Motor Truck Co., and also vice-president of Nelson Bros. Co., both of Saginaw, Mich., recently died of acute indigestion.

—

Claude Platt, who has been district manager of the central district for the Fisk Rubber Co., has been promoted to special representative.

—

Lieutenant J. B. Howell has been mustered out of the Artillery service and will rejoin the Bound Brook Oil-less Bearing Co. in his former position.

—

G. W. Stephens has been appointed sales manager of the Detroit Twist Drill Co.

—

British Highways Authorities to Increase Weight of Trucks from 5 to 6 Tons

LONDON, ENGLAND, Dec. 30—By Mail—Highway authorities representing the Government propose to increase the maximum allowable weight of motor trucks from 5 to 6 tons and to adopt other regulatory measures concerning motor trucks in general.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Moon in Production Again

ST. LOUIS, Jan. 6—The Moon Motor Car Co. has again started production of the types of motor cars made before the war with slight refinements worked out during the period. It is announced that 50 per cent production will be reached by Feb. 15 and the percentage will be pushed rapidly to 100 per cent. Then the special buildings erected for the manufacture of 6-in. shells for the navy will be brought into use for the motor car plant, much of the machinery provided for that work being available for use with some alterations.

New Livingston Radiator Corporation

NEW YORK, Jan. 7—The rights to manufacture radiators for automobiles, trucks and airplanes under the Livingston patents formerly owned by the Livingston Radiator & Mfg. Co. of this city have been purchased by the Livingston Radiator Corp. The new corporation also takes over all the mechanical equipment and processes of manufacture of its predecessor, and will place the production of this type of radiator on a quantity basis. A new management will have charge of the affairs of the new organization. The inventor, D. McRa. Livingston, again becomes associated with the manufacture of radiators under his patents, and will be vice-president and consulting engineer. E. G. Hines is president and general manager.

Hinkley to Make Engine Line

DETROIT, Jan. 6—The Hinkley Motors Corp. will on Feb. 15 commence the manufacture and marketing of a full line of engines for trucks and tractors. C. C. Hinkley, who heads the organization, was formerly chief engineer of the Chalmers company, which position he left nearly 2 years ago to enter the manufacturing field at the head of a company of his own. During the past year the Hinkley company became one of the country's two largest producers of engines for the Class B standardized truck.

New Type Roller Bearings

CHICAGO, ILL., Jan. 4—The Perfection Roller Bearing Co. has been formed here and will place on the market several new types of roller bearings, including a non-lubricated bearing and one to install on Ford rear axles. The organization is headed by C. M. Carr, and associated with him is William R. Bullion, as secretary. The company has opened headquarters at 117 North Dearborn Street, with a factory in Englewood. C. C. Bombaugh is vice-president and treasurer.

Automotive Absorbs Consolidated

DETROIT, Jan. 6—For the manufacture and marketing of a complete line of automotive accessories the Automotive Productions Co. has been incorporated here. The new concern, capitalized at $600,000, contemplates the extensive manufacture of Dann radiator filler caps, Dann automatic oil caps, gasoline tank filler caps and top holders and a starting primer unit for Fords. The company has absorbed the Consolidated Machine Co., which has been manufacturing screw machine products. The officers are: President and director of sales, J. N. Smoot; vice-president and director of engineering, E. G. Dann, formerly with the Dann Products Co., of Cleveland; secretary and treasurer, W. C. Plummer, cashier of the Federal State Bank of Detroit.

A. B. & B. Specialty Expands

MILWAUKEE, Jan. 6—The A. B. & B. Specialty Co., 3302 Fond du Lac Avenue, manufacturer of motor car accessories, supplies and parts, has awarded contracts for the erection of a two-story brick factory addition, 50 x 100 ft., to provide much-needed facilities to relieve congestion in the present quarters. Charles Stilper is president and treasurer.

Ford Dividend of $4,000,000

DETROIT, Jan. 7—The Ford Motor Co. has declared a dividend of 200 per cent, which is equal to approximately $4,000,000. The first instalment of $2,000,000 was paid Jan. 1 and the second is due Feb. 1. It will be shared by seven stockholders. It is stated that other dividends will be declared in the next few months.

Milwaukee Forge Increases Capital

MILWAUKEE, Jan. 6—The Milwaukee Forge & Machine Co., organized several months ago by Milwaukee interests to manufacture automotive parts, specializing in tractor material, has increased its capital stock from $150,000 to $250,000. The company recently completed a new machine and forge works at 340 Oklahoma Avenue and the new issue is made to provide ample working capital. Officers of the company are: President, George B. Pillar; vice-president and treasurer, John Eckert; secretary, Paul J. Ramstack.

Madison-Kipp Drops "Lubricator"

MADISON, WIS., Jan. 6—The Madison-Kipp Co. is the new corporate style of the Madison-Kipp Lubricator Co., one of the largest exclusive makers of force-feed lubricating devices and systems in the United States. During the past year the company manufactured oilers for tanks, tractors and other war machinery, besides producing the oiling systems for nearly two-thirds of all the farm tractors manufactured in the country.

Globe Tube Rebuilds

MILWAUKEE, Jan. 6—Within three days after fire destroyed the receiving, shipping and storage building of the Globe Seamless Steel & Tubes Co., at Thirty-seventh Avenue and Burnham Street, on the morning of Dec. 29, contracts had been awarded for the construction and equipment of a new building. It will be 200 x 325 ft., of brick and steel, a story and a half high, and will be completed in 40 to 50 days.

More Room for Gray-Dort

CHATHAM, ONT., CAN., Jan. 4—The Gray-Dort Motors Co. has completed a new three-story addition to its plant. This will give an increase of 50,000 sq. ft. in floor space.

Canadian Plant for Republic

TORONTO, Jan. 2—It is reported that the Republic Motor Truck Co., Alma, Mich., will erect a Canadian plant in this city, where about 5000 trucks annually are to be made for the Canadian trade.

Victor Makes Ford Mats

SPRINGFIELD, OHIO, Jan. 7—The Victor Rubber Co. has just closed a contract with the Ford Motor Co. for rubber mats and has recently completed an enlargement of its plant. Four new men have entered the company. They are L. H. Cooke of the American Trust & Savings Co.; Ira A. Stowe, formerly of the Ellwood-Myers Co.; Frank X. Lothschuetz, formerly city auditor, and E. D. Valentine, formerly with the B. F. Goodrich Co.

More Money for Townsend

JANESVILLE, WIS., Jan. 6—The Townsend Mfg. Co., manufacturer of tractors, portable and stationary gas and kerosene engines, has increased its capital stock from $125,000 to $175,000. A large plant addition has been completed and placed in operation.

La Crosse Model "G" Renamed

LA CROSSE, WIS., Jan. 5—The La Crosse Tractor Co. has dropped the name Happy Farmer in connection with its Model G tractors, which are now to be known simply as La Crosse. The Model F will be called the La Crosse Happy Farmer.

Allis-Chalmers Adds

MILWAUKEE, Jan. 6—The Allis-Chalmers Mfg. Co. is erecting a large addition to its main works in West Allis, suburb of this city, where it will concentrate its tractor manufacturing department and greatly enlarge the output, in addition to producing two new types to supplement the standard model. Allis-Chalmers tractors now are being made in the Reliance works, located in Milwaukee, but operations in the new tractor plant at West Allis will begin early in the spring.

Adopt Program for N.A.D.A. Meeting

Graham and Willys Slated to Talk at Annual Gathering Jan. 28 and 29

ST. LOUIS, Jan. 6—A tentative program for the annual meeting of the National Automobile Dealers' Association in Chicago, Jan. 28 and 29, has been adopted. In this draft of the program, few speakers are named because the men invited, and who have accepted "if possible to be there," have not yet sent final acceptance.

There is little or no politics talked here. It appears to be a general impression that President Vesper would succeed himself. All meetings will be at the La Salle Hotel. The general meetings will be in the Red Room.

The big event, aside from the work of getting the association in shape for next year, will be the frolic, at which all hands will be guests of the Chicago Automobile Trade Association. The program as drafted follows:

TUESDAY, JAN. 28.

9.00 A.M. Registration of delegates.
10.00 A.M. Meeting called to order. President Vesper presiding. Appointment of committees. Credential, resolution, nominating. Report of standing committees.
11.00 A.M. President's address.
12.00 Noon Luncheon in the same room.

TUESDAY AFTERNOON.

2.00 P.M. Meeting called to order. President Vesper presiding. Addresses by Geo. M. Graham, Pierce-Arrow Motor Co.; John Willys, Willys-Overland Co.; to be followed by short talks on the following subjects: Good Roads, Salesmanship, Cost Keeping, Business Efficiency, Advertising.

WEDNESDAY, JAN. 29.

10.00 A.M. Meeting called to order. Short talks by officers on accomplishments of association, future policies and aims. Limited discussion by members. Four-minute men only.
12.00 M. Luncheon.
2.00 P.M. Meeting called to order. Report of committees. Election of officers. Adjournment.

WEDNESDAY EVENING

Banquet and trade frolic by Chicago Automobile Trade Association at La Salle Hotel.

Ocean Freights Reduced

WASHINGTON, D. C., Jan. 4—Ocean freight rates between Atlantic ports and ports in South America, Asia, Japan, Australia and Africa have been reduced from one-fourth to one-third, effective for January and February loadings.

The reductions have been made by J. H. Rosseter, director of operations of the Shipping Board, and are intended to stimulate the use of tonnage now available for American exporters.

South American rates are $22.50 per ton to North Brazil from Para to Pernambuco; $25 to Middle Brazil from Maceio to Santos; $30 from Pelotas to Porto Alegre; $25 to Montevideo and Buenos Aires; $27.50 to La Plata; $30 to Rosario, Bahia Blanca and Port Madrya, Argentina; $45 to Japan and China; $40 to Manila; $45 to Singapore and Saigon; $52.50 to Penang, Bangkok and Port Swettenham; $45 to Calcutta and Colombo; $50 to Bombay, Rangoon and Madras; $60 to South East Indies. For Brisbane, Sydney and Melbourne the rates are $40, with the same main tariff for New Zealand ports and $45 for Freemantle and Adelaide. The tariff to South African ports is $35 and to West African ports $25.

Automotive Products Corp. Specializes in Export

NEW YORK, Jan. 6—The Automotive Products Corp., Woolworth Building, has undertaken the export of cars, trucks, tractors, parts, accessories, etc., upon a comprehensive plan which provides not only for efficient service in the actual handling of the goods, but exercises control over the standards of the automotive products so as to insure their measuring up to a high standard. In addition, the corporation's program calls for serving the foreign merchant and looking after his interests in addition to the primary function of selling him.

The president, H. W. McAteer, and the vice-president, C. B. McElhany, of the new company, hold similar offices in the American Steel Export Co.; the general manager, E. P. Chalfant, has been prominently identified with the industry for many years, and the secretary-treasurer, C. A. Musselman, is also well known to the trade.

Emergency Stop for Chicago-New York Airplane Mail

NEW YORK, Jan. 8—Plans are being formulated to institute the often-postponed New York-Chicago airplane mail route at an early date, though no definite date has been set. The Post Office Department has established five landing fields and emergency stops. These are at Lehighton, Pa., 105 miles; Bellefonte, Pa., 115 miles; Clarion, Pa., 87 miles; Cleveland, 128 miles; Bryan, O., 157 miles; Chicago, 166 miles. A staff of 12 pilots has been engaged for the work.

Overland Had $80,000,000 War Contracts

TOLEDO, Jan. 7—War contracts, valued at $80,000,000, entailing an expenditure of $12,000,000 for new equipment and buildings, have been completed by the Willys-Overland Co. and allied plants. The contracts included Curtiss training plane engines, French 75-mm. gun carriages, machining 8-in. shells, Liberty eight and twelve-cylinder engines, Mark 111 adapters and lifting plugs for shells, Sunbeam airplane engines and military tractors for the British Government.

Wagon Makers Standardize Treads

CHICAGO, Jan. 8—Manufacturers of farm wagons and trucks have decided definitely to adopt the 56-in. tread and 38-in. width of bed as standard for all vehicles. It is considered likely that these standards will also be adopted in Canada. Manufacturers, however, will be permitted to sell wagons of the old pattern which were made up to Dec. 31.

Tractor Will Change Selling

Minnesota Implement Dealers Hear How and Why It Will Revolutionize Methods

MINNEAPOLIS, Jan. 8—That the tractor will revolutionize the selling of farm equipment is the opinion of F. W. Pettit, sales manager, the Wallis Tractor Co., who to-day addressed the fifteenth annual convention of the Minnesota Implement and Vehicle Association. Mechanical power supplements or displaces horse-drawn power on the farm of said Pettit. Types of implements change from horse-drawn to power-drawn and gradually but surely we realize that with the coming of a new type of power must come a new type of selling, for power farming not only will revolutionize methods of agriculture but methods of doing business as well.

The manufacturer must necessarily see that his plant and equipment are operating on a basis of constant production; therefore it is necessary for him to seek channels of distribution for a steady output and these dealers naturally will be selected who are best equipped to assimilate this production during twelve months of the year. He will select as his dealrs, those that are most likely to emerge from the final competition.

Pettit does not think the advent of the tractor means necessarily the passing of the implement dealers, but he does think that in order to survive with success and profit it is necessary for the implement dealer to make a stronger bid for tractor business than he has been doing; for beyond any doubt, with the tractor will go the tractor-drawn and tractor-driving machinery, and with the two unquestionably will go the horse-drawn line as well.

Pettit sees the development of a super-dealer who is sufficiently organized financially and otherwise to conduct a vigorous sales plan that will cover farm lighting equipment and water furnace systems, in addition to trucks, tractors and power farming machinery.

Whether the ultimate dealer be an implement dealer, or an automobile dealer, or both, it is unquestionably true, says Pettit, that in every community opportunity likely will knock first at the door of the implement dealer and when the latter has the ability and versatility to change his methods and conform to the change in conditions, he may become the ultimate dealer.

Otherwise, the outside forces which are coming into the trade, and which are accustomed to an aggressive type of salesmanship, will win. The implement dealer must meet this aggressiveness with aggressiveness, for he is certain to see arise the vigorous and hustling methods of the motor car salesman.

Prof. F. W. Peck of the University of Minnesota spoke on the tractor from the viewpoint of economical management of the farm. He indorsed the three-bottom tractor as the economical unit for Minnesota, but said the tractor, generally speaking, was no cheaper to operate than were horses, its value resting upon other considerations.

Peck said the greatest difficulty tractor owners experienced in power farming was an inability to get adequate service from dealers.

F. H. Retzlaff, dealer at Newulm, Minn., told the convention that the tractor business, without the right kind of service from the dealer, was not worth a damn.

They justify their indifference toward the tractor on the ground that it is necessary to give so much free service that prevalent discounts are not sufficient to pay for this service and give them a profit in addition. They object also to the requirement of a deposit in addition.

Calendar

ENGINEERING

S. A. E. Meetings

Feb. 4-6—New York. Winter Meeting. Society of Automotive Engineers, Engineering Societies' Building.

Feb. 6—Victory Dinner, Hotel Astor, New York.

Feb. 5—Minneapolis Section, S. A. E. — Hotel Radisson. "Radiator Cooling Fans."

March 5 — Minneapolis Section, S. A. E.—Hotel Radisson, "Tractor Service and Sales."

April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

MOTOR SHOWS

Jan. 11-18—Los Angeles, Cal. Automotive Exposition.

Jan. 15-18 — Spokane, Wash. Progressive Automotive Show in dealers' salesrooms. Auspices of Spokane Automobile Chamber of Commerce.

Jan. 20-25 — Shreveport, La. Shreveport Automobile Dealers' Assn. Henry B. Marks, Manager.

Jan. 20-25 — Hartford, Conn. Broad Street Armory, Auspices of Agricultural Interests.

Jan. 24-30 — Milwaukee, Wis. Eleventh Annual, Milwaukee Automobile Dealers, Inc., Auditorium. Bart J. Ruddle, Manager.

Jan. 25-Feb. 1—Chicago. Passenger cars. Coliseum.

Feb. 1-15—New York. Automobile Dealers' Assn. Charles A. Stewart, Manager, Hotel Woodward, Broadway and 55th St.

Feb. 3-6 — Chicago. Trucks, Coliseum.

Feb. 5-8—Fargo, N. D. North Dakota Automobile Dealers' Assn., Auditorium.

Feb. 10-15—Rochester, N. Y. Rochester Automobile Trades Assn., Exposition Park. George C. Donahue, Manager.

Feb. 10-15—Kansas City, Mo. Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.

Feb. 15-22 — Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.

Feb. 15-22—Albany, N. Y. Albany Automobile Dealers' Assn. State Armory.

Feb. 17 - 22 — Louisville, Ky. Louisville Auto Dealers' Assn.

Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.

Feb. 17-22 — Pittsfield, Mass. Pittsfield Automobile Dealers' Assn., State Armory. James J. Callahan, Manager.

Feb. 17-22 — Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.

Feb. 17-22—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

Feb. 18-22—Baltimore, Md. Baltimore Automobile Dealers' Assn. and Automobile Club of Maryland, Fifth Regiment Armory. H. M. Lucius, General Manager.

Feb. 23-March 1—Cedar Rapids. Auditorium, Automobile Dealers' Assn.

Feb. 24-March 1—Kansas City, Mo.—Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

Feb. 24-Mar. 1 — Springfield, Mass. Automobile Dealers' Assn. Harry W. Stacy, Manager.

Feb. 27-March 6—New York Aircraft Exhibition by Aircraft Manufacturers' Association, Madison Square Garden.

March — Scranton, Pa. Thirteenth Regiment Armory, Scranton Automobile Assn.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrandt, Manager.

March — Great Falls, Mont.—Montana Automobile Distributers' Assn.

March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.

March 1-8—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.

March 1-10—San Francisco, Cal. Motor Car Dealers' Assn. G. A. Wahlgreen, Manager.

March 3-8—Columbus, O. Columbus Automobile Show Co., Memorial Building. W. W. Freeman, Manager.

March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.

March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

Mar. 10-15—Omaha, Neb. Fourteenth Annual. Omaha Automobile Trade Assn., Auditorium. Clarke G. Powell, Manager.

Mar. 12-19—St. Joseph, Mo. Sixth Annual, St. Joseph Automobile Dealers' Assn.

Second or third week March—St. Louis, Mo. St. Louis Auto Mfrs. & Dealers' Assn. Robert E. Lee, Manager.

March 15-22 — Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.

Mar. 22-29—Pittsburgh Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.

Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.

April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided — Harrisburg, Pa. Harrisburg Motor Dealers' Assn. J. Clyde Myton, Manager.

Not decided — Hartford, Conn. Hartford Automobile Dealers' Assn.

Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.

TRACTOR SHOWS

Jan. 20-25 — Hartford, Conn. Broad Street Armory.

Feb. 24-Mar. 1—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building, Kansas City Tractor Club. Guy H. Hall, Sec.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show, Wichita Tractor and Thresher Club. Forum.

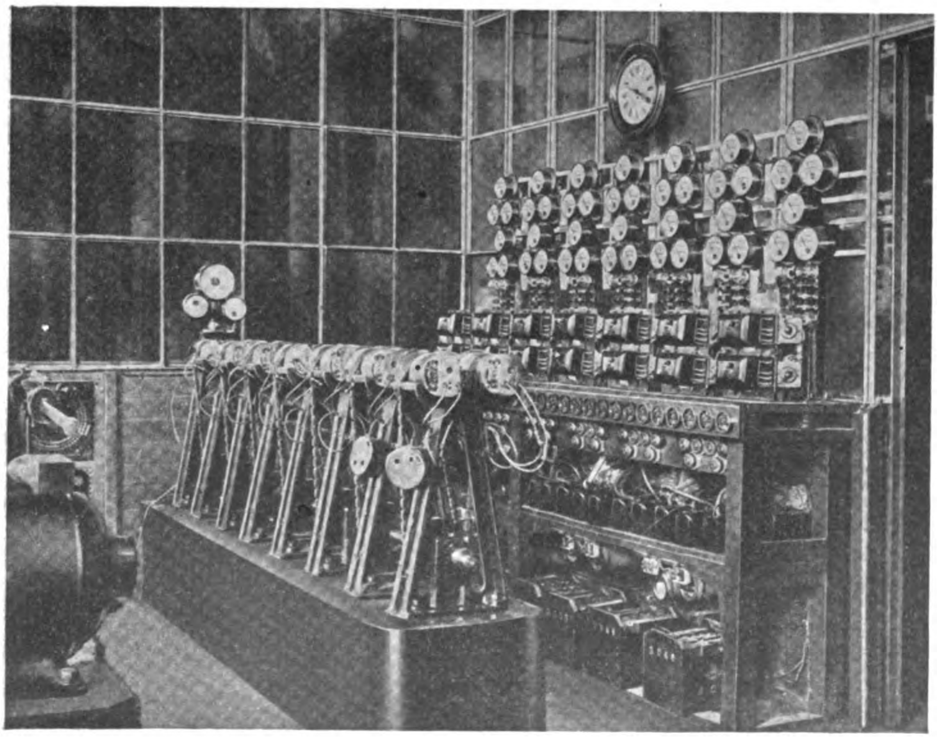
CONVENTIONS

Feb. 4-6—New York. Meeting Society Automotive Engineers.

Jan. 7—New York. Dinner of Aircraft Manufacturers' Association, Waldorf.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

Testing Electrical Equipment at the Fiat Plant



A special testing apparatus has been developed by the Fiat Co., Turin, Italy, for the testing of a large number of lighting sets at the same time. The stand illustrated has a capacity for testing fourteen complete systems at once

Following Directions

ARE you one of the motorists who last winter used an anti-freeze compound in a manner which the maker of the preparation never specified and then condemned the stuff as being no good? If you did such a thing, you had better make sure that you followed directions to the letter. The manufacturers of anti-freeze compounds have met car and truck owners more than half way, and the complete directions printed on every label of their products are put there for but one purpose, and that is, to make sure the preparation will be used correctly.

OBVIOUSLY if the motorist does not do his part and merely dumps the stuff in his radiator, without following directions, he does wrong and one morning he will go to his unheated garage only to find the tubes of his radiator burst or the waterjacket cracked. The next thing he does is blame the anti-freeze substance, whereas, had he been careful to follow instructions he could have gone all winter without worrying about the cooling system.

MOST of the anti-freeze preparations have been put up in convenient form, but the amount of water in the cooling system together with the variation in temperature dictate to a considerable extent how the preparations must be used. All this is set forth in the maker's directions and in every case the big thing to watch is that the radiator has no leaks and that the hose couplings are in good shape. In fact, new hose is desirable before adding the anti-freeze, as after a season's use the inner layers become separated.

THE radiator should be washed out carefully with a solution of hot soda, which reveals any leaks that exist. These then should be soldered. Many anti-freeze substances attack dirt and sediment and if your radiator started to leak last winter after you added the anti-freeze, it was because you failed to clean the radiator and repair the leaks. The anti-freeze told you that leaks existed. You probably thought the anti-freeze was eating away the metal. Follow the maker's directions this winter and you will play safe.

VOL. XL. NEW YORK—THURSDAY, JANUARY 16, 1919—CHICAGO No. 3

No British Post-War Models in Low-Price Field

From 6 to 9 Months Must Elapse Before the Makers Can Start Deliveries—Still on War Work

FOREIGN AUTOMOBILE PLANTS GREATLY EXPAND

But Manufacturers Still Adhere to Policy of Producing Few High-Priced Cars Instead of Many Low-Priced Ones—Believe Quantity Production Impossible

By David Beecroft
Directing Editor, Class Journal Co.

LONDON, ENGLAND, Jan. 15—*Special Cable*—The British automobile industry has very indefinite opinions concerning the future, and at this time has no definite program for new models.

It will be 6 months—with many factories, 9 months—before any deliveries of post-war models can be started.

A very few makers, not more than half a dozen, can be said to have post-war models ready. The remainder are putting pre-war models on the market at prices increased by 60 per cent.

Many automobile factories will have to continue for months on aviation engines and planes. Contracts for shell have been cancelled. One or two large manufacturers who have been producing aviation engines will have to continue till August on war work and cannot start to produce automobiles before that time.

There are no new Britsh post-war models in the low-price field.

Manufacturers appear more interested in $4000 and $5000 cars than they are in cheap ones.

Ford has no rival; and American automobiles selling at $1000 have few new British rivals.

Mr. Beecroft sailed for New York the day this article was cabled. He has been in Europe since November 9 as one of a party of American business paper representatives who have been the guests of the British government. The party traveled extensively in England, Scotland and France and was afforded unusual opportunity to investigate social environment, industrial pursuits and war activities. All the party returned to New York on January 2 except Mr. Beecroft, who remained to make a tour of the principal manufacturing centers of Italy

"COMMERCE, if it is to stay, must be a constructive force and never a destructive thing.

"We must serve the world if we are to be on safe foundations ourselves.

"The mere entering a foreign market by force of cut prices or of off-quality goods or by 'dumping' or by untruthful advertising, or by force of government aid or political power is in no true sense commerce, *nor will it last.*

"We must carry the flag as high in the commercial world as we have carried it before our armies.

"It means that we are going to play the game like gentlemen and make our methods such as shall survive because they render service. The ancient law has never been repealed that *'he who would be chief among you, let him be the servant of all'* and America having served with her dead and wounded sons in France must now serve the world by her factories and with her merchandise.

"That means that we must sell goods that others want and not unload those of which we would like to rid ourselves. That means we must forget there is behind the word 'foreigner' anything of implied contempt.

"That means that our visions and sympathy must be big enough for foreign trade; we must be large enough to adapt ourselves to it. If we are not, somebody else will be.

"It means that we must win upon our effectiveness, not upon our hustle, that we must carry our business far *because it is right* that it should go far on its own merit.

"It means a lot of forgetting and a lot of learning on the part of many of us." *—Wm. C. Redfield, Secretary of Commerce.*

The greatest British effort in this price-class field is Crossley, which has a post-war model to sell for $2500.

British makers still favor high-priced cars built in small quantities, rather than cheaper cars produced in greater quantities.

The Ford touring model now sells for $1000 here. This is an enormous increase and can be ascribed partly to increased cost of parts, which are purchased by the government on a cost-plus basis, and partly to higher transportation charges.

At the present time, the Ford Motor Co. is producing 3000 cars per day in its Manchester factory. These are produced by special arrangement, under which the government imports parts for the Ford company.

Want Import Duty Retained

London importers of American cars have not yet received permission to import American cars, although a united petition has been made to the government to let down the bars.

The opinion is that the government may continue total prohibition for two or three and perhaps for four months, but any action which is taken will likely be somewhat delayed because of the interference with other routine matters brought about by the Peace Conference.

In general, the opinion is strong that the majority of British automobile manufacturers will ask that the import duty be continued as at present. The opinion is strengthened by the fact that at the recent election four or five large automobile manufacturers were put into office, and it is known that they are all favorable to a combination of the present import duty.

But it is not the duty which worries British makers. Importers of *American cars do not fear the duty,* but they do fear a continuation of the total prohibition against imports as at present.

The restrictions against the importation of American commercial vehicles continue, but special petitions to the government are being heeded, and undoubtedly trucks will be permitted to be imported in limited quantities soon.

Importers of passenger automobiles are receiving permits to import sample machines which can be exhibited. However, they are not allowed to be sold.

Dealers who import French and Italian cars are making strong appeals to the government requesting permission again to take up the importation of these machines.

Over 46,000 British war trucks are to be repaired by the manufacturers and sold in Great Britain. This will extend over many months.

Truck Prices Not Abnormally High

British manufacturers of trucks have reached large production, due principally to the stimulus of war, and prices are not abnormally high as is the case with passenger cars.

In general, the British manufacturer does not believe that he can install such quantity production plans as are in use in the United States, and agrees that America will monopolize the low-price market.

The production lessons of the war, learned in turning out munitions, have not yet been incorporated into automobile manufacture. In fact, many makers

are quite undecided as to how to utilize the large factories—in many cases from three to five times as big as before the war—which have been built up.

These great plants are thoroughly modern. They are full of new machinery, which is mostly of American make. They have central heating plants, excellent lighting, large canteens, employees' recreation rooms, and Red Cross facilities.

Furthermore, these enlarged factories are all paid for out of profits made in war work. In addition, the companies have made large profits since the beginning of hostilities.

The growth in French and Italian factories is equally startling. Fiat, for example, has 50,000 employees; Renault has 25,000 and other French factories have grown threefold and fivefold. Here, too, makers all have excellent new, large factories, all paid for out of war profits, with a substantial profit in addition.

Renault and Fiat Post-War Models

Both Renault and Fiat have new post-war models ready for the market, and in both cases these have been designed for quantity production and low price.

Both companies are going out strong after world markets.

Hereafter, all European post-war models will have complete electric lighting and starting systems. Even old models are being fitted with such equipment.

The adoption of lighting and starting apparatus brings to light the great necessity for international standards on such parts as batteries, headlamps, and so forth. As it is now, France, Italy and England are all making batteries to different standards. This will work havoc with maintenance.

Olympia First Real Exposition

French manufacturers will show their first post-war models at the Lyons Sample Fair in March, but the revived Olympia show which is to be put on by British makers in November will in reality be Europe's first great exhibition of post-war cars.

Some of the new features that it is expected will be seen are detachable cylinder heads, valve-in-head engines and unit power plants. In general, the small engines will be block fours. But most of the new larger engines will be sixes. One or two new eight-cylinder models are expected. American body design, with the radiator the same height as the body lines is coming into vogue.

Dealers Survived War Well

British dealers have survived the war in good financial condition and are ready now to start re-selling. Many mechanics, drawn into the war, have now been demobilized and are anxious to enter the automoble business. It is expected that there may be a surplus of agencies.

Despite the fact that gasoline is now selling for $1 a gallon, the use of cars is increasing. Thousands of cars stored during the war are being brought out, cleaned up and started to running once more.

Manufacturers of ignition apparatus and other accessories whose plants were greatly enlarged during the war are all ready for a big peace production, and already the manufacture of straight-side tires has been started by the largest tire manufacturing company.

All automobile factories started to operate on a 47-hour week on January 1. Work begins at 8 a. m., with 45 minutes for lunch. The Ford company decreased its working hours from 48 to 40 per week and now assembles three more chassis per day under the shorter schedule. There have been many strikes due to the shorter hours because they upset the traditional methods of home life, women refusing in many cases to prepare late breakfasts.

Dismissing Hundreds of Women

Many of the large factories are dismissing hundreds of women employees because the labor unions insist that women gave higher production and more accurate work than men.

The manufacture of aviation engines and planes has slowed down considerably and large plane factories will be three or four months completing existing contracts. There are quantities of planes waiting for engines. However, several automobile makers have succeeded in getting airplane contracts reduced, thus permitting them to get back to car production sooner.

Progressive systems for the production of cars and trucks are used by only two companies—the Ford Motor Co. and the Associated Equipment Co., the latter being the maker of the London buses. This company has built 15,000 war trucks and is by far the largest truck maker in England.

Few Modern Assembling Methods

Other manufacturers are assembling in the old way, using hundreds of needless workers. All European factories are wofully lacking in racks and stands for materials passing through the factories. In consequence, floors are cluttered and finished parts too often are laid among the disorder. The use of electric industrial trucks is confined to a few factories and multiple spindle machinery is used in only four or five plants, and is not yet nearly as general as is the case in America.

The heads of British factories all complain that workers endeavor to do as little as possible and get as much pay as possible. At the same time, too many makers are following the same policy of selling automobiles at the highest prices and manufacturing as few as possible.

British dealers complain that British factories do not give quick service on spare parts and that service is still only vaguely understood. War has hampered such work, but there remains ground for much criticism.

During the war, British makers were greatly hampered by the government. The industry was suppressed more than was necessary. Many plants which were turned to shell production suffered great losses of skilled workers, and have now to rebuild their working forces.

British makers admit that going into war was easy as compared with the problems involved in getting back into peace production.

1919 Engineering Trends

Development Indicates Important Future Changes

Stagnation Brought About by War Has Created Unparalleled Opportunity for General Re-designing

Average Price Now on Level with the Pre-War Car and Not Likely to Go Down for Some Time

Few Mechanical Changes Because of Scarcity of New Models Brought Out Last Year

Importance of Simplifying Small Details of the Chassis Becoming Better Realized

Six-Cylinders and Overhead Valves Likely to Manifest Steadily Increasing Popularity

By A. Ludlow Clayden

IT has been the custom of AUTOMOTIVE INDUSTRIES each year to analyze the trend of automobile design and of engineering as shown in the passenger cars of the year. These analyses have hitherto always shown tendencies very clearly, and a study of the curves published one year can now be seen to have been almost invariably a true indication of what was to follow during the ensuing period.

For the successive years up to January, 1917, progress was regular and recordable, but at the end of that year it was obvious that passenger car design had been stagnated by the war. One could see the increased price due to rising material and labor markets, the lack of new models due to engineering activities being concentrated upon aircraft, tanks and multifarious other weapons.

None the less, there were changes in the tables and data published Jan. 3, 1918, because many new chassis were ready before the United States declared war.

Changes Due to Eliminations

This year such changes as appear are due mainly to eliminations. Every feature of the automobile analyzed in detail shows some change, but this is because many of those chassis included in the calculation of the averages last year have been taken off the market and have not yet been replaced by new designs. Some notable absentees will be observed by a careful study of the specification tables, and, of these, many are firms that will soon have new cars but whose experimental work is not far enough ahead to enable them to say with certainty what the specifications will be.

Of the cars remaining, many have been unchanged for nearly 2 years, so the trend curves and tabulations may be said to indicate negative development rather than positive trends. It is safe to say that in another 12 months' time a good half of the chassis now listed will be remodeled. There will be many entirely new cars—some new makes even. Price, now at a zenith, must fall again, or if the costs of material and labor remain at near their present level, then cheaper types of machines will be built—possibly smaller in size and less lavish in equipment.

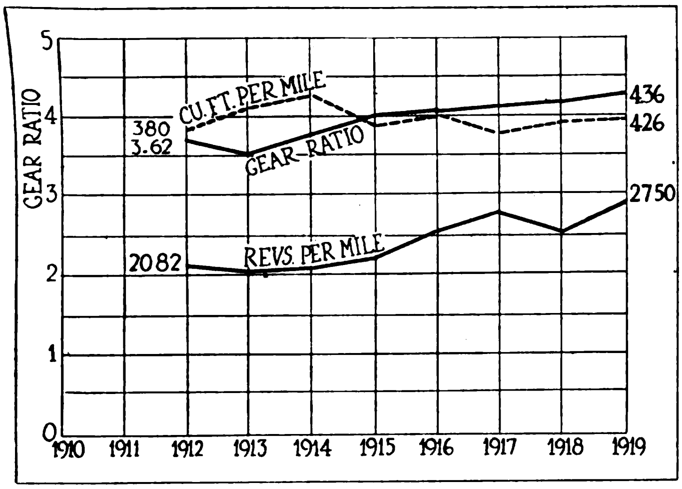
It was never so hard to predict engineering tendencies, nor was the immediate future ever so teeming with possibilities for new and good ideas. In 1915 the average engineering quality of the American passenger automobile improved enormously; it was the banner year for new cars, for higher efficiency, lighter weight and greater convenience for the owner. The year 1919 bids fair to equal if not surpass that of 1915.

Much That Is New Is Coming

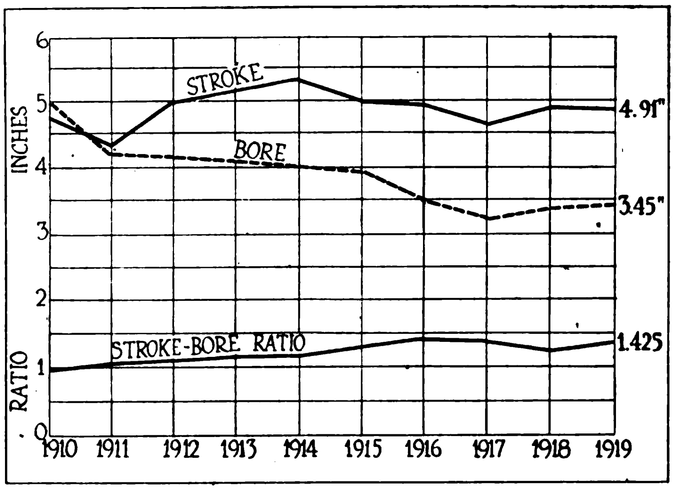
There are several reasons why much that is new should be anticipated. Firstly, owing to the aforementioned war stagnation, there is a majority of chassis which are due to change; it is time to market new models from the merchandising viewpoint.

(*Continued on page* 94)

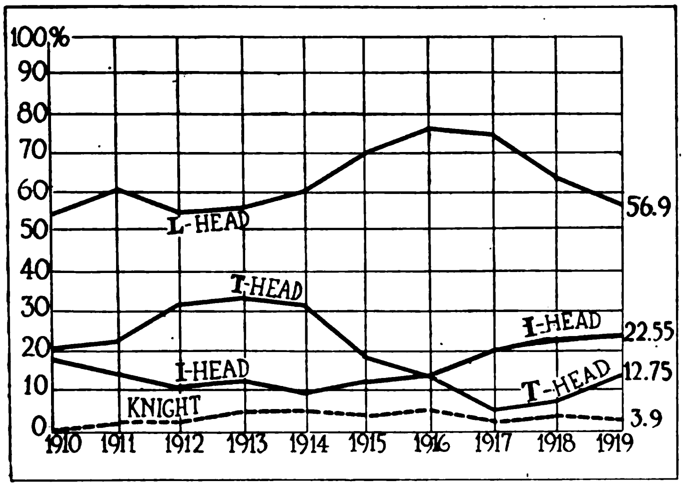
Automobile Engineering Tendencies



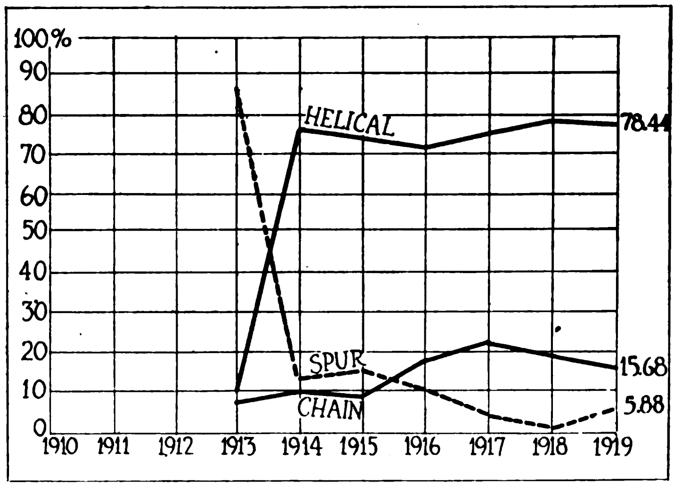
Compared with figures for the average car last year, the number of crankshaft revolutions per mile has increased from 2500 to 2750, and this, of course, has caused a corresponding increase in the number of cubic feet of mixture per mile required by the engine



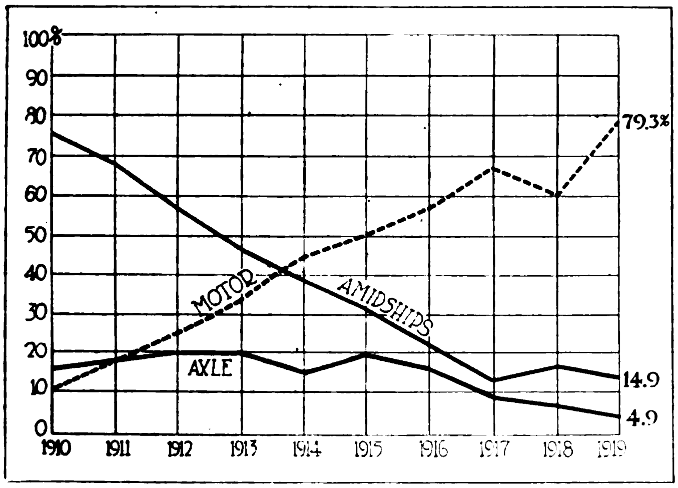
The bore of the average engine this year has decreased .03 in., whereas the stroke has increased .02 in. This accounts for a corresponding increase in the stroke-bore ratio, which amounts to 0.17. The average cylinder size of to-day is approximately 3½ by 5 in.



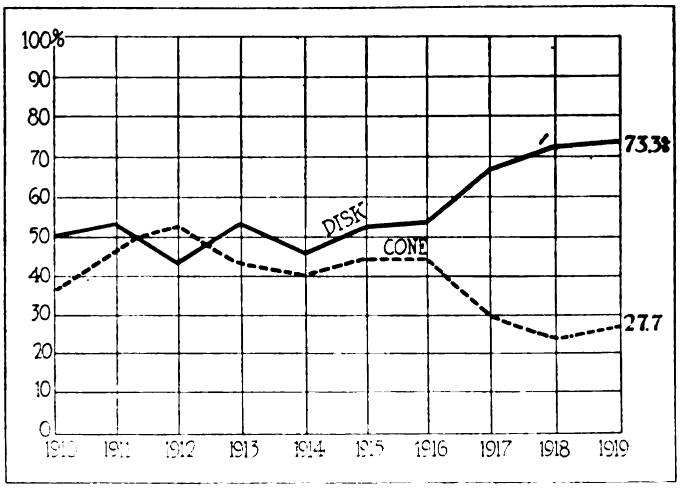
The valve-in-head engine still shows a slight increase, the figure last year being 22.2 per cent, though the gain is not as great as expected. The T-head engine shows quite an increase—from 6.8 per cent to 12.75 per cent—and the L-head has dropped from 63.5 per cent to 56.9 per cent .



In the drive of accessories, tendencies have not been so closely followed. Helical still leads, after its phenomenal gain in 1914, but both this and chain have dropped off slightly this year. Spur gear drive has increased slightly from 2 per cent to 5.88 per cent



The great gain in the location of the gearset in unit with the engine, which became apparent in 1914 and 1915 and dropped off in 1918, made a big gain again this year, jumping from 71 per cent to 79.3 per cent. The two other locations both show a slight decline in use



The percentages of disk and cone clutches in use show very little change since 1916, when a decided preference for the disk type first became a noticeable trend. This year, as was the case last year, they are both holding their own

1919 Engineering Trends

(*Continued from page* 88)

Secondly, many of our engineers have had their time wholly occupied by other things and they are returning to automobile work with an energy and a zest.

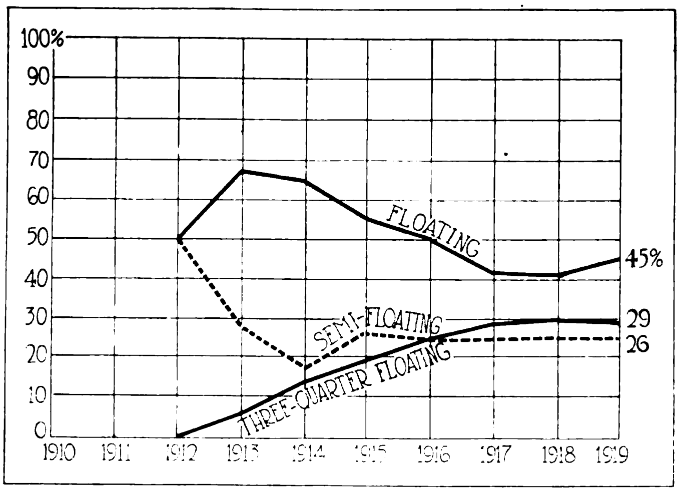
Thirdly, aviation engine manufacture, while it has produced little in the way of design which is applicable to automobiles, has without doubt shown many a manufacturer new methods for making things better.

Labor is accustomed to more accurate work, the possibilities for accuracy of many tools have been improved, the number of capable inspectors has been multiplied many times. These things mean that many an engineer will now dare to ask his shop for work of a more difficult nature than he would have been able to consider two years ago. Last, but by no means least, the machine shop set up for the old model has been ripped out of a large proportion of plants, and it is as easy to tool up for a new car as to retool for the old one.

At the exact and precise effects of all these things one can do no more than guess. The one certain thing is that they will be very perceptible.

There has never before been a similar opportunity for a general redesigning. Never before has a manufacturer of years' standing been able to contemplate putting into production a completely new machine at the same cost which he would have to face in continuing the old one. This opportunity becomes of increasing importance as the factory grows larger, so there is possibility that in 1919 we shall see some great changes in the product of the very largest plants; in other words, improvements may be looked for among the cheaper cars.

The average price of the 1919 American touring car is now $2,226. This is calculated from the prices existing



There has not been a great deal of change in the preference for the three types of rear axle. During the year gone by, the three-quarter floating type has declined very slightly, but the two other methods are practically where they were last year

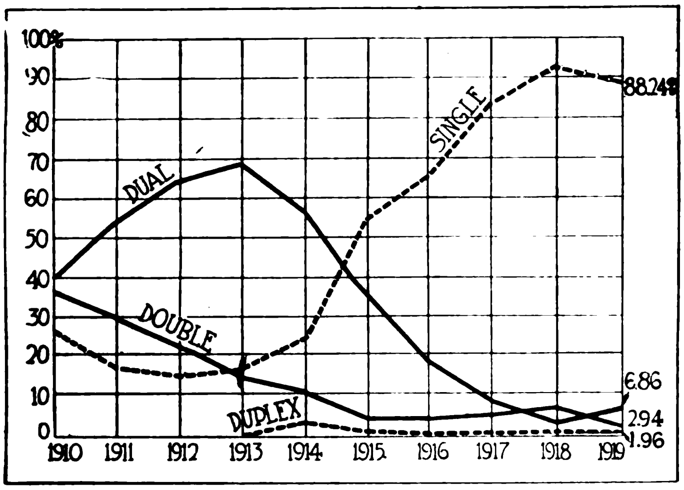
Jan. 15, 1919, for 99 different cars. There are 102 chassis listed in the specification tables this year, but a few of the manufacturers withheld prices.

It is interesting to look back along the curve of price fluctuation on the large folded supplement to this issue of AUTOMOTIVE INDUSTRIES, and to observe that a similar price prevailed just before the outbreak of war in August, 1914. In January, 1910, the average price was $2,214. In 1914 the $2200 mark was crossed during the tremendous fall in average price which occurred during that year, and now the curve is back again practically on a level with the $2,214 of January, 1910.



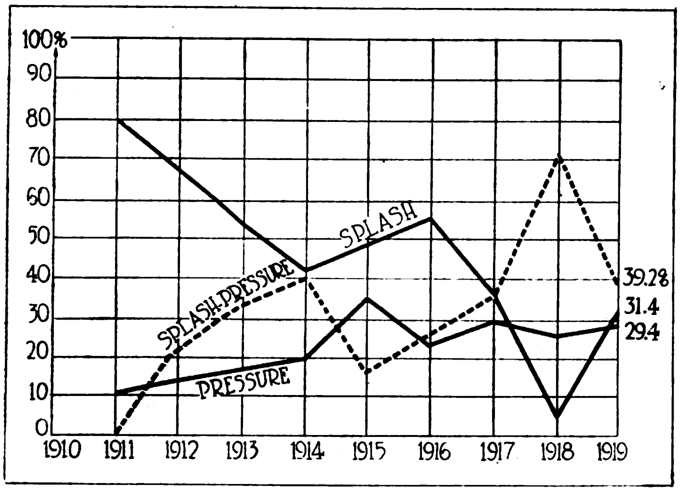
Ignition movements since 1914 have been generally consistent up to the last year when dual dropped below double. Now they have crossed again and are the same as at the end of 1917. Single ignition has dropped off very slightly

In complaining about the great increase in price caused by the war it is therefore wise to give a few moments' thought to the value now offered for $2,226 as compared with that obtainable 9 years ago for practically the same sum.

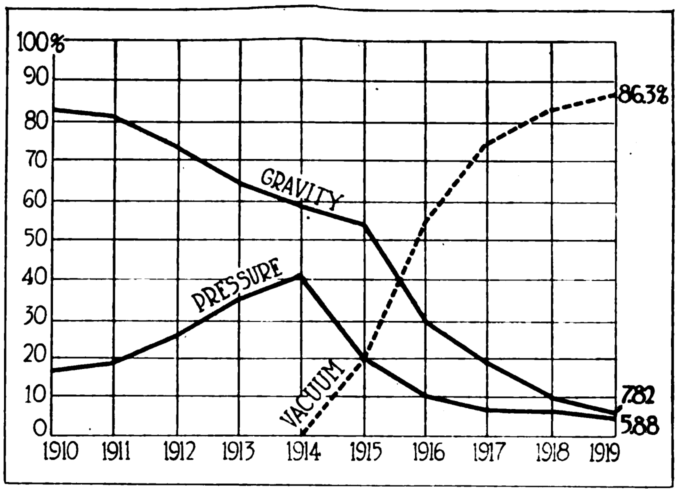
Yet again, when the cost of material and labor in 1910 is thought of and compared with to-day's figures, the amazing thing is not that prices have risen so much in the last 2 years, but that they have not gone far higher. Of course, the explanation lies in the immense improvement which has been made in manufacturing methods; it is this which enables the industry to give two or three times the value for money in automobile products.

Prices Will Not Drop

What will be the average price in January, 1920? It is a most interesting speculation. One thing is absolutely certain, and this is that it will not be very far below its present level. The industry learned its lesson, or should have done so in 1916, when prices were lowered too much owing to the false idea that the demand would not be sufficient to absorb the production. The market for high-priced cars ought to be very good indeed in America



In lubricating systems, splash has taken a decided upward trend during the last twelvemonth, gaining from 2 per cent to 31.4 per cent. Splash-pressure, on the other hand, has shown quite a drop, coming down from 71 per cent to just a little over 39 per cent



For five years now, the use of vacuum gasoline feed has shown a steady and consistent gain in favor and this year shows a further gain of from 83 per cent to 86.3 per cent. Both gravity and pressure systems show a slight decrease in popular favor

and that for cheap and moderate-priced vehicles is good throughout the world, for the whole world is calling for cars.

While there is no doubt that European competition in overseas markets will be keen, still for several years to come there is room for the absorption of all the automobiles that all the manufacturers can turn out of their shops. This means that there is no need for price cutting and it will be surprising if the average price existing a year hence will be more than two or three hundred dollars below the present average, perhaps not so much.

Few Mechanical Changes

Studying the trend curves relating to mechanical features, practically no change is to be seen, due to the lack of new designs. Many manufacturers who had new chassis ready to put into production have withheld them. Several new firms which were planning to break into the field during last year were compelled to withdraw. Thus there is no mechanical tendency deducible from the specifications which give much indication of what we may look for during 1919 in the way of engineering novelties.

It is, however, possible to forecast a little from what are known to be the ideas of some of the representative manufacturers. Here one may regard the past year as dead and can go back to 12 months ago, taking up the then clearly discernible tendencies and carry on from that point just as though 1918 had been removed from the calendar.

Doing this shows that the type of six-cylinder engine which was appearing on various new cars in 1917 is going to be a popular variety in 1919—that is to say, the medium size six of from 200 to 300 cu. in. displacement developing fairly high torque for its dimensions and having a brake mean effective pressure at the peak of its torque curve of around 100 lb.

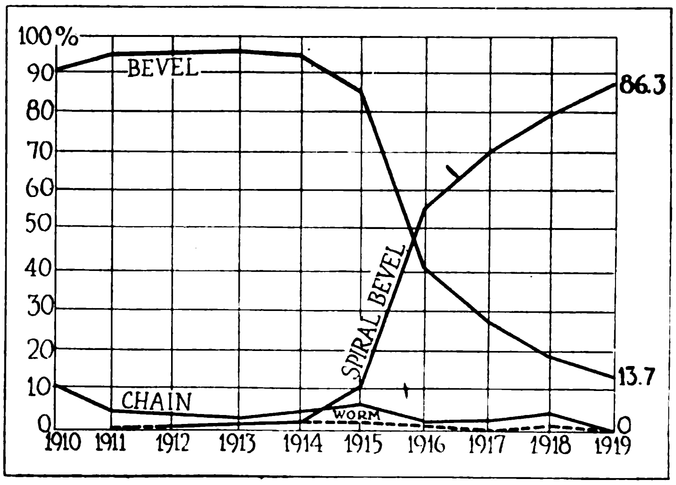
The overhead valve will be found on a large proportion of cars to be announced during the next six months partly because it is a better manufacturing job in these days of detachable cylinder heads and partly because the fuel conditions almost demand completely machined combustion chambers.

There seems little probability of many new eights or twelves. Some new fours there will be in all degrees of price, but the six will be the predominant type.

Four years ago an article published in *The Automobile* analyzed the cylinder situation and argued that if it were true that a cylinder of, say, 50 cu. in. displacement were the most desirable size, then there was room for all types of multicylinder motors according to the size and weight of car. Since that time development has rather tended to confirm the view that a cylinder of such a size is a good average, but meanwhile the size and weight of chassis have decreased, so that rather smaller motors are well able to take care of the job.

Furthermore, the eights and twelves introduced in 1915 were all new and all of a good high standard of engineering, while most of the sixes of that year were rather old and of a much lower standard. Since then the same engineering has been applied to the six, so that the difference in all-round performance between one number of cylinders and another is now more a matter of opinion than of actual fact among cars with a total piston displacement and weight of about the same value.

Again, the improvement in the design of sixes has permitted the use of lower gear ratios, so that while the piston displacement for all cars now averages only 267.4 cu. in. as compared with 307.38 cu. in. in January, 1915, the cubic feet of piston displacement per mile run on high gear has risen from 408 cu. ft. in 1915 to 426 cu. ft. in 1919. The revolutions per mile were 2300 in 1915 and are 2750 to-day.



Spiral bevel drive which first became prominent in 1915 and showed a big increase in 1916 has increased still more in popularity, rising from 79 per cent last year to 86.3 per cent this year. Both chain and worm drive have entirely disappeared

So far as can be judged, it is unlikely that the gear ratios will go any lower than they are on the representative modern machine, but it is more than probable that during 1919 still more of the adherents to comparatively high gearing will follow the trend, at the same time decreasing the dimensions of their engines. Thus while the average displacement per mile is not likely to increase, the average figure for revolutions per mile may show a rise next time it comes to be determined.

The cars for 1919 are going to be exceptionally interesting because between the fall of 1914 and the spring of 1917 so many new things were tried, and the war period has given the industry a breathing space in automobile development, permitting it to observe, study and digest the performance of this and that feature in the hands of the owner.

In the three years mentioned all sorts of new engines, all sorts of new spring suspensions, new and different types of ignition, a variety of new systems of frame design, and many new styles of bodies were produced and sold. Some of these ideas were good, some bad, some indifferent; now, during the coming year, we shall be able to see clearly what was really permanent.

Looking back, it is possible to see that many of the subjects discussed, say at the S. A. E. summer meeting in 1915, were not of much importance fundamentally, although they appeared to be so at the time, while some other developments which took place quietly have become general practice almost without discussion.

As an outstanding example, the cantilever spring may be mentioned. Its introduction was of importance not because of any special virtues inherent with the *design*, but because it caused engineers to think more about springs, and so led to a great and general improvement in the riding qualities of cars. On the other hand, the deep section, stiff frame, which is of almost as great importance in giving easy riding, has crept into use everywhere, and yet the reasons for it and the way to lay it out have hardly ever been even common topics of conversation among engineers.

Importance of Simplified Details

Another important thing, which has improved the reliability of cars and decreased the cost of their production, but yet has passed unnoticed, or almost so, at engineering gatherings, is the general simplification of detail. We have better brake layouts, better wiring, better spring shackles, fewer grease cups, simpler fan-belt adjustments, better accessibility, and a host of similar things, each too small to make a subject for argument but in their sum equally great as the better engineering in our engines.

While the work of the prominent engineers has improved in laying out the broad features of their cars, so has there been a great change in the work of the lesser lights whose duty it is to detail small parts.

The American public, in fact the automobile-using public of the world, owes much to the leading American automobile engineers, but their numerous assistants, whose names are not known outside their own factories, deserve as a body at least as much credit.

It is possible that 1919 will be a year of weight reduction, and if it is not then it is safe to predict that 1920

Nevada	7,987
Total	5,945,442

THE number of motor vehicles in use in the United States increased 20 per cent in the 11 months between Dec. 31, 1917, and Dec. 1, 1918, thus setting a new record for distribution of one vehicle for every 18 persons, and bringing the number of vehicles in use up to within 54,588 of the six million mark. There are now 5,945,442 cars and trucks in use, as compared with 4,941,276 in 1917. This represents a gain of 1,004,176. These are net figures with all duplicate, non-resident and re-registration deducted.

The gain is not so great, of course, as was the gain the previous year when we registered 1,396,324 more vehicles than during 1915, but this was to be expected, for the last 11 months has been a period remarkable in the history of the United States. The war extensively disrupted both manufacture and commerce. The production of motor vehicles fell off 42 per cent, from 1,938,778 last year to 1,124,606 up to Dec. 1 of this year. There have been Liberty loans and other disturbing factors, but that these have not had the bad effects so freely predicted for them is indicated by the increase in registration.

Steady Gain For 7 Years

For the seven years for which accurate data are available we have shown a steady gain in registration. The gain has fluctuated to a certain extent, and reached the peak in 1916 when the percentage of increase was greatest. Following are the figures:

Year	Gain	Gain %
1918	1,004,176	20
1917	1,139,324	39
1916	1,121,164	50
1915	669,218	38
1914	501,536	40
1913	243,521	24

During the first half of 1918, the net gain in registration was 525,665, this despite the fact that six states showed a loss of 33,324 for the period. During the last half of the year, these same states not only made up all this loss, but rolled up individual increases of from 10 to 48 per cent in addition.

Ohio leads all the states for the increase it shows for the year. Last year it was New York that held first place for showing the greatest increase. Then comes Iowa, which last year was third, and following is Illinois, which has not changed. Pennsylvania, which last year

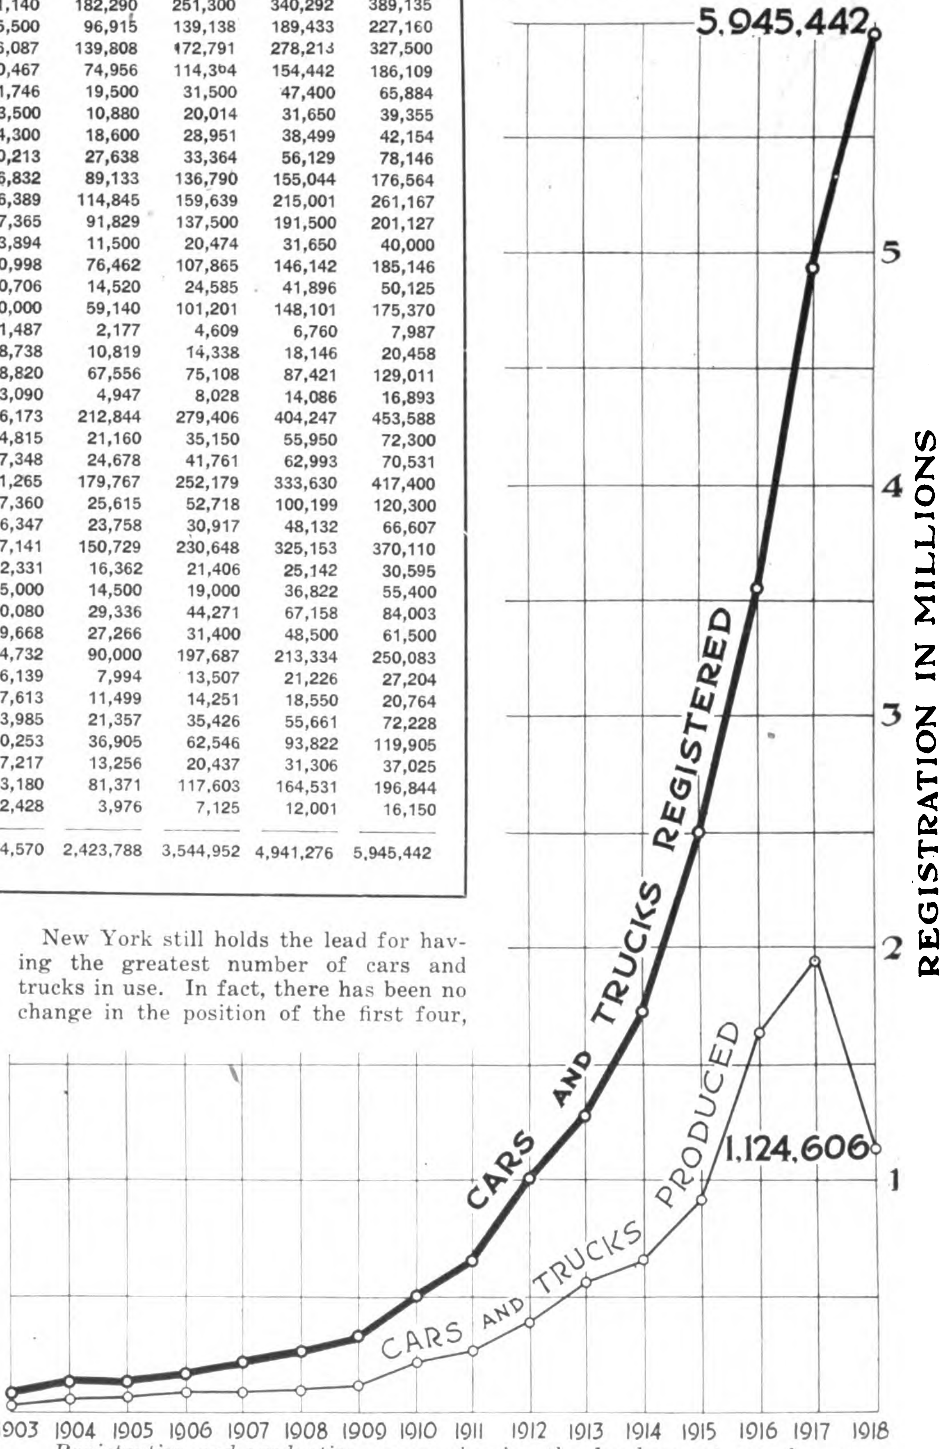
New York still holds the lead for having the greatest number of cars and trucks in use. In fact, there has been no change in the position of the first four, Ohio being second, Illinois third and Pennsylvania fourth. Iowa has moved up from seventh place to fifth and Michigan has moved up from ninth to seventh; California dropped back from fifth to sixth.

Gains are Scattered

Among the states that have made the greatest gains, it is somewhat unusual that these are not grouped to the extent they were last year. For example, both Ohio and New York which head the list of gainers, are more manufacturing centers than they are agricultural. Iowa, which is third, is undoubtedly principally agricultural, but Illinois and Michigan, was the third greatest gainer, this year has dropped down to sixth place.

But though Ohio made the greatest gain, numerically, the District of Columbia was far ahead of all the states in percentage of gain. The fact that the District registered 89 per cent more cars this year than last will serve as some indication of the great influx into the National capital during the war. Last year there were 21,198 cars and trucks in the district, as against 40,045 this year.

In 1917 it was Florida that registered the greatest gain in percentage, the figure being 176 per cent. This year, however, the increase was but 20 per cent. South Carolina is in practically the same position this year as she was last. She registered a gain of 50 per cent this year and 89 per cent last. The District of Columbia and South Carolina were the only ones to show more than 50 per cent increase in registration.



Registration and production curves showing the development year by year ***from 1903 to the end of 1918***

The total under the heading "Number of Names" in the table at the right represents the number of individual establishments. This is not a total of the individual columns. For example, the dealer may or may not operate a garage, repairshop, supply department, etc. These two tables were compiled by the Automobile Trade Directory

which come next, are only partly agricultural. And so it goes: California is a fruit-growing state; Pennsylvania is partly agricultural, partly mining and partly industrial; New Jersey is industrial; Missouri is farming and so is Indiana; Texas, Wisconsin and Kansas are agricultural.

On the whole, the greatest gain has been made among the agricultural states, which is a condition that has obtained for several years, and is particularly understandable this year because of the increased importance and purchasing power of the farmer.

Here, for example, are figures on a group of leading agricultural states which in each instance show gains:

State	1917	1918

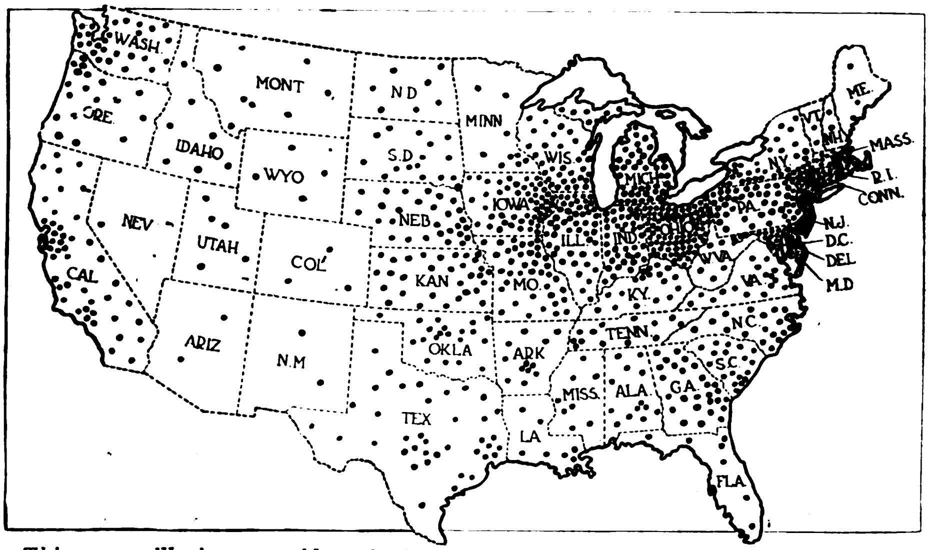
Total	1,004,176	
Average for United States..		20%

The New England states, which a year ago showed a very small increase compared with other centers, this year show a substantial gain. Here are the figures:

State	1917	1918
Maine	38,499	42,154
Vermont	18,146	20,458
Massachusetts	155,044	176,564
Rhode Island	25,142	30,595
Connecticut	74,642	84,902
Total	311,473	354,673

Iowa and Nebraska, as might be expected from the records of previous years, head the list insofar as per capita distribution of cars and trucks is concerned. In each of these states, the entire population can be carried in their vehicles. Each has one motor vehicle for every seven persons. Last year, Iowa had one for every 8 persons and Nebraska one for every 9 persons.

(*Continued on page* 198)



This map will give some idea of where the big gains in registration were made. Each dot represents 1000 vehicles gained over the previous year

Record of Performance of American Planes

This Table Serves to Illustrate the Numerous Types of Airplanes Built by the U. S. Government Since June, 1917—At One Period Nearly 60,000 Employees Were Engaged in the Work in Various Factories

OF the airplanes enumerated in the above table of performances, the following numbers have been actually produced and delivered into service either overseas or to flying fields in the U. S. In all, 517 De Haviland 4 machines have been completed at an estimated cost of $6,512 each, 2960 JN-4-D machines costing $4,646 each and 24 Bristols, costing $6,750 each.

Other JN planes, designated as type H, for training, gunnery and bombing purposes were shipped. Of these, 402 were training planes, 312 were for gunnery use and 100 were bombing planes. The cost of these is estimated at $4,750 each. Another type, known as SJ-4, not included in the table of performances, was produced in quantities at an estimated cost of $4,500 each. No less than 1600 of these were shipped.

Production commenced in June, 1917, with a total of 147 JN-4-D machines; from then on the rate increased rapidly and in January, 1918, a total production of 729 planes was reached. Production was maintained through the following months and during the summer a number of Penguin planes were built at a cost of $2,025 each.

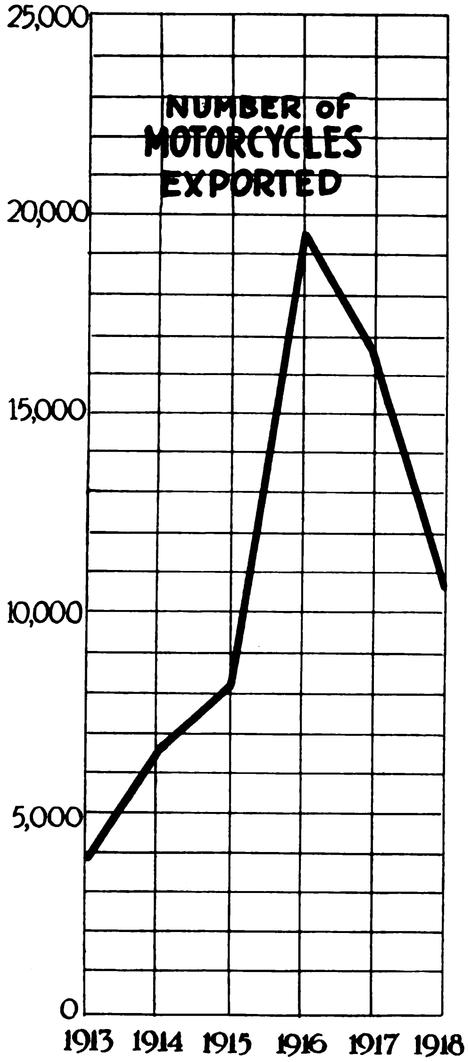
Motorcycle Exports

(Prior to 1913 Motorcycles were included with "Bicycles")



PRIOR to 1913 the U. S. Bureau of Foreign and Domestic Commerce evidently did not consider that the motorcycle possessed sufficient importance to justify an individual set of figures in its official records, and accordingly it included the motorcycle with the ordinary push-bicycle. Those figures which are available seem to indicate that of late years the motorcycle occupies a position of some importance in the foreign trade of the country, as from 1913 to 1918 our exports were valued at $12,616,559, a value representing that of no less than 63,267 motorcycles.

As is the case in certain other export tabulations in this issue of AUTOMOTIVE INDUSTRIES, war has shown a marked effect on the volume and value of our exports. Early in the struggle it was fully apparent that a motorcycle could travel under conditions impossible to an automobile, such as carrying reports and messages at speed over shell-shattered roads where the means of transport had frequently to be carried over obstructions or around or through shell-holes.

Hence it came about that although England, France and Italy had well-equipped motorcycle factories capable of

producing large numbers of machines, we received hurry calls for all available supplies. Our prompt and effective response is shown by the figures given herewith.

Of course we have, apart from the temporary demand created by war, a world-wide trade in motorcycles. In this connection it is of interest to note that the smaller countries, far removed from the fighting zone, are consistently improving as motorcycle buyers. For instance, Siam, a country which but a few years ago was utterly dissociated in the public mind with things mechanical, seems to be adopting the motorcycle.

Perhaps the principal lesson to be learned from this tabulation of motorcycle exports is that the American machine is now thoroughly known in districts in which, before the war, few motorcycles of any kind were seen; that repeat orders from foreign governments and from distributers and dealers prove that it is appreciated as well as merely known, and that the conditions prevailing during the past few years have given the United States motorcycle manufacturer an opportunity to further cultivate his interests abroad.

Trucks Show Few Mechanical Changes

War Activities of Engineers Have Retarded Mechanical Development in Commercial Vehicle Design—Curtailment of Supplies of Raw Material Has Reduced Production Originally Planned

FEW changes involving either basic design or refinement in detail have been made in the gasoline trucks offered on the 1919 market as compared with those produced in 1918. No doubt the primary cause is that the abnormal conditions under which this branch of the automotive industry (in common with others) has been operated during the past year acted as a deterrent to development along lines other than those of accepted engineering practice. Another reason is that truck design under the severe demands of war-service has advanced so rapidly since 1914 that it has reached a point of relative excellence which leaves but little to be desired from a purely mechanical point of view.

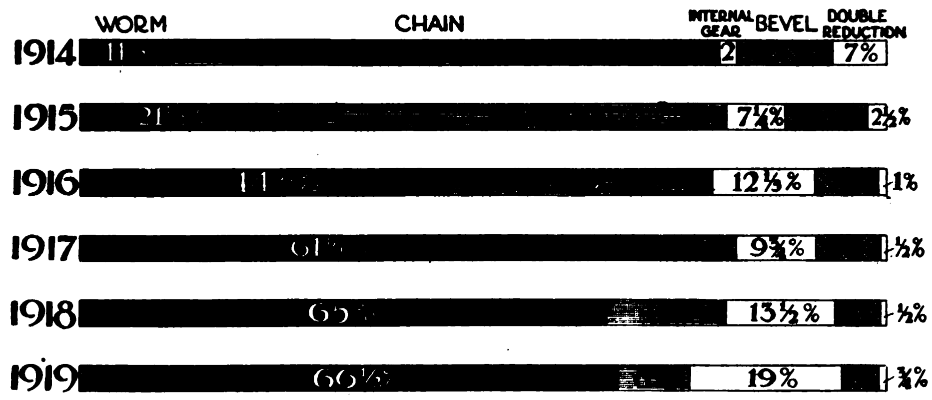
There is still much to be done in the development of the gasoline truck from a strictly utilitarian point of view, and doubtless engineering skill will lend its aid in this direction, supplementing the efforts of the sales organization to perfect a program planned to provide the maximum of earning capacity at a minimum of operating cost and a well-devised system of distribution, service and maintenance.

A Readjustment of Sizes

Obviously the load capacity of a truck is determined by the maker on the basis of demand. Trucks are built in capacities ranging from under half a ton to over 7 tons, and it is apparent that there is work suited both to the extremes as well as to the intermediates.

While the 1-ton truck still leads the field in respect of the number produced, the greatest gain in the number of models of any given size offered for 1919 is in the 1½-ton classification. Twenty-four more models of this size are listed than were offered in 1918. If the popularity of a size be judged by the number of models offered, the 2-ton truck leads the field for 1919 with 89 distinct offerings. It is followed closely by the 1½-ton size with 75 models, the 1-tonner with 68, the 3½-tonner with 62 and the 5 and 5½-tonners with 59.

Taking the six-year period from 1913 to 1919 the 3½-ton truck has shown the greatest gain, the 41 models now offered being over seven times the number marketed in 1913. The 2½-ton truck has also gained in favor during this period.



FINAL DRIVE BY MODELS OFFERED

The final drive averages shown above are calculated on the number of models offered in each particular year and as included in the specifications of those trucks published by the Class Journal Co. for that year. The averages must not be confused with those on the same subject based on the production of trucks. The latter averages are given below, so that the true situation in regard to types of final drive may be had both from the basis of number of models offered and of number of trucks produced. The above percentages indicate the decline in the chain drive for some form of inclosed drive

FINAL DRIVE BASED ON PRODUCTION

The above are averages calculated for the year 1918. *The* 1916 *production was* 98,000 *trucks;* 190,000 *in* 1917 *and* 250,000 *in* 1918. *Thus, while the percentage of bevel-driven trucks decreased* 2¼ *per cent in* 1918, *there were actually more bevel-driven trucks made in* 1918 *than in* 1917

Price Tendency Is Upward

Owing to the additional cost of material, labor, etc., there has been a general increase in truck prices. There have been no advances which were not fully justified by abnormal production conditions and there is no indication of any downward trend. In fact it is more than likely that some further advances may be announced in the spring, but it is impossible to prophesy with conditions as they are at present.

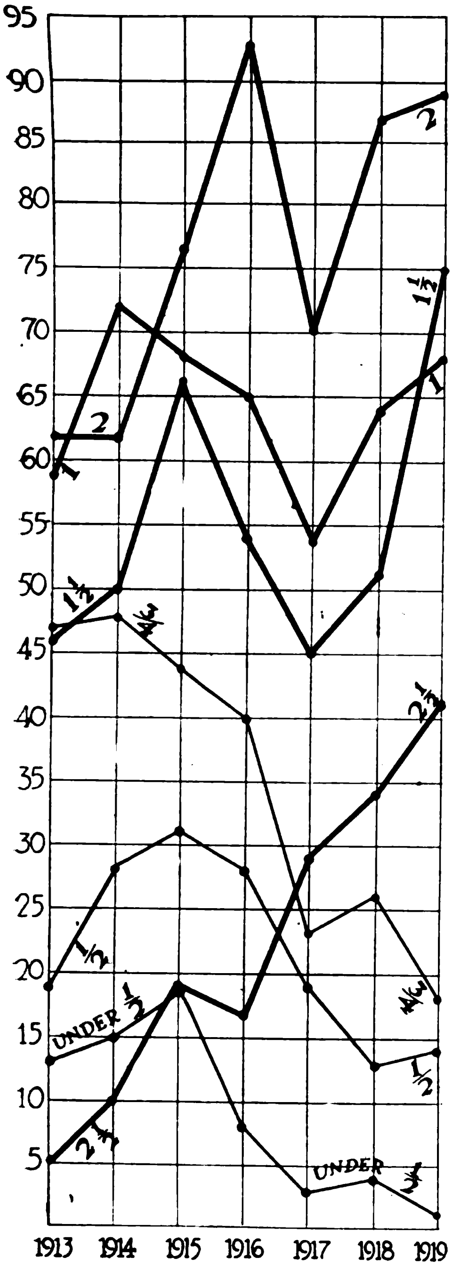
For the reason that prices have been advanced almost daily it is not easy to calculate the precise percentage representing the difference between 1918 and 1919 prices. A careful calculation made in November and based on actual current figures furnished by manufacturers showed that at that time the average increase in all models and sizes of trucks was 17.1 per cent. As a matter of fact individual prices advanced anywhere from 10 to 20 per cent and at the present time it may be safely assumed that the average advance is in the region of the latter figure.

It should not be forgotten that with wartime restrictions it was a matter of practical impossibiliy to increase production for commercial service (as distinct from Government work) and thus reduce overhead charges to a point which would permit of the truck being sold at the same price as before.

It is of interest to observe that the standard army truck has not yet affected to any appreciable extent the design of the regular commercial models. It is not likely that any modification embodied in army trucks will be adopted until present orders for standard commercial vehicles are filled. Then, should such a course be considered advisable, the various parts makers will be ready with the various jigs and tools formerly used in Government work and now available for other service.

1919 Mechanical Practice

As already pointed out there are practically no novelties or departures from generally accepted standard design, but



Truck Design for 1919

THERE are very few mechanical changes, standardization of parts may be considered as accomplished and developments may be expected now that the factories are reorganizing on a peace-time basis of operation.

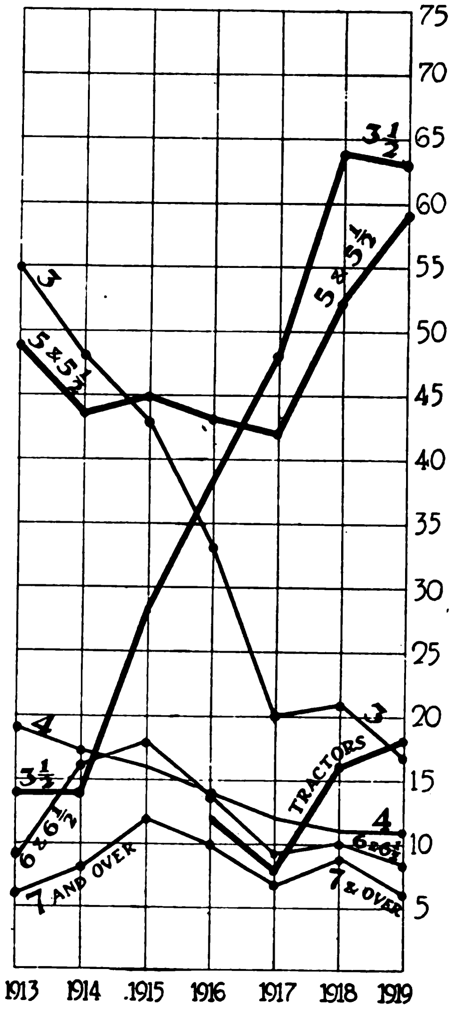
Three and one-half ton trucks show the greatest gain in number of models offered, although the one-tonner leads in actual number.

There has been little attempt made to solve the problem of using heavy fuel.

Amidship gearsets have increased in number, no doubt for the reason that they tend to prevent shaft-whipping.

Chain drive continues to give way to drives of one or other of the enclosed types.

Worm drive appears to be the favorite on trucks of ½, 1, 1½, 2, 2½, 3½ and 5 tons, as indicated by averages of all models. Hotchkiss type of drive continues to be popular.



These curves and the ones opposite are based on specifications compiled during the past 7 years by the Class Journal Co. and do not take into account the number of vehicles of a given model sold. The heavy lines indicate an increase in the number of models of a given size and the light lines a decrease

there are one or two exceptions of interest.

Perhaps one of the most important of these is the new type of double-reduction axle brought out by White. In this the second reduction is secured at the wheel instead of in the differential housing. This axle has several other unusual characteristics and has been under development and test for several years.

Size of Engines Increased

In engines the tendency is to increase size. For example, the average engine on the ¾-tonners has been increased from 3¼ x 5 to 3½ x 5, with a corresponding increase in horsepower from 16.92 to 19.61. The average engine of the 1-ton truck is now 3¾ x 5 as compared with 3½ x 5 in 1918.

In gearsets there is a tendency to adopt the use of four speeds in trucks for the 3 to the 5-ton sizes. Side chains are disappearing and are being replaced by one or other of the forms of enclosed drive. As evidence of this, chain-driven trucks are now but 8¾ per cent of the total production as against 15 per cent in 1918. On a production basis chain-driven trucks for 1918 were but 6 per cent of the total as compared with 9 per cent in 1917. Both worm and internal-gear driven trucks show increases, bevel drives are fewer and trucks with double-reduction drive have increased both on the basis of the number of models offered and on that of production.

Hotchkiss drive has held its position except in the case of 5-ton trucks, where radius rods are used on the majority of the models offered for propulsive purposes. Better brake lay-outs and the use of longer springs which are practically flat under load have overcome any earlier difficulties arising from the use of this type of drive.

Automatic control of engine temperature has not progressed to any great extent during the past year, although at the beginning of 1918 it was prophesied that the conventional cooling system would be discarded in favor of a system with automatic control. At the same time it is evident that some form of improved cooling will sooner or later be developed in order to insure greater engine efficiency throughout the climatic range from winter to summer.

Solid and Pneumatic Tires

Where solid tires are regular equipment, the pressed-on type is becoming practically universal. This has been brought about to some extent by the considerable increase in the number of tire presses available throughout the country. There appears to be little change in the ratio of the use of giant single tires on the rear wheels as compared with dual solids.

There has been a normal growth in the use of pneumatic tires for trucks of up to 2 and 3-ton capacities and it is indicated that the use of giant pneumatics for trucks of around 5-ton capacity will be extended.

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s,l&i—starting, lighting and ignition
s,l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig zag tube core, sheet case

# of Gasoline Motor Trucks for 1919

As Produced by 219 American Manufacturers—Full Particulars on Types Rear Axles, Steering Gears, Governors and Also Electric and Fuel Systems

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s,l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
plst—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s.l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s,l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s.l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
sprs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s,l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermeo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
pist—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s,l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

ABBREVIATIONS—Types of Construction

*Other Options
amid—amidships
auto—automatic
bevl—bevel
c—center
c&l—center and left
c&s—cushion and solid
cent—centrifugal
c-s—cast steel
c-a—cast aluminum
cel-cst—cellular core, cast case
cel-pst—cellular core, pressed steel case
cel-sht—cellular core, sheet case
chn—chain
cylinders cast, 2 in pairs
cylinders cast, 4 in block
cylinders cast, 3 in threes
cylinders cast, 1 singly
d-d—dry disk
d-p—dry plate
d-rd—double reduction
d-s—driveshaft
elec—electric
ext-d-s—external driveshaft
ext-f-w—external front wheels
ext-g—external gear
ext-jst—external jackshaft
ext-r-w—external rear wheel
fab—fabric
fin—finned tube
fin-c-a—finned tube core, cast aluminum case
fin-cst—finned tube core, cast case
fin-pst—finned tube core, pressed steel case
fin-sht—finned tube core, sheet case
fix—fixed
flex—flexible
fric—friction
g.p.—gear pump
grav—gravity
gset—gearset
hyd—hydraulic
ind-c—individual clutch
int-d-s—internal driveshaft
int-f-w—internal front wheels
in-g—internal gear
in-g-4—internal gear drive on 4 wheels
int-r-w—internal rear wheel
jst—unit with jackshaft
l—left
l&c—left and center
leat—leather
l-b—loose ball
ltg—lighting
metl—metal
mtr—unit with motor
opt—optional
p—plate in oil
plst—piston pump
plan—planetary
pnu—pneumatic
pres—pressure
prog—progressive sliding gearset
p-t-c-a—plain tube core, cast aluminum case
p-t-cst—plain tube core, cast case
p-stl—pressed steel
p&s—pneumatic and solid
r—right
r-ax—unit with rear axle
rng-cst—ring core, cast case
rol-c—rolled channel
rol-i—rolled I-beam
r-rd—radius rods
selec—selective sliding gear
s-flex—semi-flexible
stg—starting
s&l—starting and lighting
s.l&i—starting, lighting and ignition
s l&i2—starting, lighting and ignition, two-unit
sing—single
s—solid
s&c—solid and cushion
spgs—springs
sq-t-cst—square tube core, cast iron
sq-t-sht—square tube core, sheet case
stk—stock
sub-f—sub-frame
suc—suction
s-bev—spiral bevel
ther—thermo-syphon
tor-a—torque arm
t-t—torsion tube
unt-x—unit with axle
vacm—vacuum
wd—wood
w-d—multiple disk in oil
worm—top worm
w-p—wet plate
zz-t-cst—zig zag tube core, cast case
zz-t-pst—zig zag tube core, pressed steel case
zz-t-sht—zig-zag tube core, sheet case

Truck Production for 1918 Is 250,000

A Gain of 32 Per Cent Over 1917—Indications That 1919 Will Be Record Year—Great Highway Developments Indicated—The Truck's Future and Load Capacity Trend

DESPITE abnormal manufacturing and selling conditions which affected every industry in the country to a greater or lesser degree during the past year, and which were particularly detrimental to the development of the automotive industry (except in its capacity for handling successfully the enormous tasks set it by the Government), 1918 will go down in history as a record breaker on gasoline truck production.

It is true that the restrictions placed upon the activities of the truck builder in all directions other than the filling of the country's military requirements resulted in failure to reach the estimated output of 310,000 trucks for the year, but, nevertheless, all former annual production figures were eclipsed in 1918.

Excluding attachments designed to convert passenger cars into trucks (so-called), 250,000 trucks of all kinds were built during the past year, as compared with a total of 190,000 in 1917. Thus it is that although the scheduled goal was not reached by 60,000, the 1917 figure was exceeded by precisely a similar figure, a gain of 32 per cent.

Unwarranted Restrictions

It is a curious commentary on the frame of mind of our wartime legislators that although the War Industries Board went on record early in 1918 with the statement that it considered trucks "to be an important means of transportation, the use of which was not to be curtailed," this branch of the industry suffered continually from adverse priority orders curtailing the supply of essential material and thereby experienced much delay and loss. The Highways Transport Committee and other Government departments repeatedly expressed their opinion that the widest possible use of trucks should be encouraged by every possible means, but nevertheless the officially dictated handicap continued to be imposed for an appreciable time. Yet 1918 was a record truck year.

It is not possible to prophesy with any degree of accuracy the truck production for 1919, but it is safe to place the minimum around 290,000. It is true that all official restrictions have been removed, but the reorganizing of factories on a peace basis, the inevitable redistribution of labor and the possibility of having to meet overseas necessities for steel and other metals to be used for reconstruction work in devastated districts have caused a temporary feeling of uncertainty as to when normal production can be resumed throughout the country. Under favorable circumstances it is quite conceivable that this minimum production figure will be substantially exceeded before the year closes.

The one hundred per cent plus service rendered by the truck in war has done much to enable the potential commercial user to visualize through a wider angle lens the vast possibilities the truck affords in peace, and there is no question that the demand waits but to be filled as soon as our truck factories have passed through the reconstruction period and are operating on a normal production schedule.

Where the 1918 Trucks Are Operating

Of the 250,000 trucks built in 1918, present figures indicate that 137,000 have gone into commercial service in the U. S., as compared with the domestic consumption of 153,000 during 1917. Thus, assuming the 1918 demand was the same as that of 1917, there was an apparent shortage of 16,000 trucks. In other words, there should be an excess demand for 16,000 trucks over and above whatever may prove the normal demand in 1919.

Of the balance of our 1918 production, approximately 12,000 trucks were exported, irrespective of the 102,000 delivered to the Government for military service either overseas or at home. Of the 1918 production, assuming that all trucks on order were completed by December 31, 1918, approximately 41 per cent went into military work.

The Status of the Military Truck

A matter of vital importance to both the truck maker and the truck user is how the problem of the existing military trucks will be solved. The manufacturer naturally views the situation from the angle of how the sale of such trucks is likely to affect his business, and the user thinks he sees the possibility of securing serviceable used trucks at a cut-rate price.

Common sense and a slight knowledge of conditions overseas indicate that a belief that all trucks now with the American Expeditionary Forces will remain there until worn out is fully justified. Approximately 47,000 trucks were shipped abroad for military service, and it is fairly evident that all of these will be needed to maintain our army of occupation. Afterwards it seems highly probable that any of the trucks yet capable of giving adequate service will be absorbed by the industrial army of rehabilitation which must follow on the heels of our fighting forces. Therefore the problem, so far as these overseas trucks are concerned, may be considered as solved.

It is with regard to the forty-odd thousand Government trucks which are in this country that the position demands a measure of consideration, ignoring any balance of uncompleted orders which have not been cancelled. Assuming that the Government turns over 20,000, or perhaps 25,000, trucks to the Post Office Department, there still remains a large number to be disposed of.

It is too soon to speculate on the manner in which the problem of distributing this truck surplus can be solved without reacting to the detriment of trade. It is possible that nothing can be done until the peace treaty is actually signed, as this undoubtedly will have considerable bearing on the ultimate disposition of the vehicles. For example, the size of our overseas army of occupation and the possible necessity for maintaining a relatively large force on police duty abroad may in itself give the answer. It is understood that several of the allied governments are anxious to purchase any trucks not needed by our War Department, and this, again, may clear up the situation to the satisfaction of those most concerned.

The suggestion has been made that any remaining surplus of Government trucks should be employed in the reclamation of Western waste lands and in the construction of a national system of highways, instead of being placed on the market at cut prices.

The subject is one of real importance to the trade, and for this reason it is expected that full consideration will be given it by all parties in the course of our various schemes for the return of business generally to a peace footing with a minimum of hardship imposed on any branch of the nation's industry.

1919—A Year of Road Development

Railroad congestion and inability to handle the abnormal freight movement demanded by wartime conditions gave the truck the chance to prove itself. It has done so to the full. Given reasonably good highways, the railroad short and middle-distance hauls are things of the past. Trucks, when operated with a reasonable degree of intelligence, have shown

they can do the work with greater efficiency, much greater speed and at lower cost.

Trucks have invaded the cotton fields of the South and the lumber camps of the North; they have shown what they can do in the grain-raising districts of the Middle West, and they have proved their worth to the farmer who must reach the market town with his perishable products in a minimum of time. The Post Office has demonstrated that its fleet of trucks is earning four times its cost, and is planning to operate 2000 more on 600 new routes in the immediate future.

Admittedly the truck has shown conclusively what it can do—it remains to provide a highway system which will furnish the opportunity for unlimited truck-mileage irrespective of weather conditions. The wear and tear on highways has been greater than ever during the past year, but owing to the impossibility of obtaining materials less than one-half of the money available for construction and maintenance was expended. Thus, our roads are now, speaking generally, in a pretty bad state.

Federal Highways Commission Is Probability

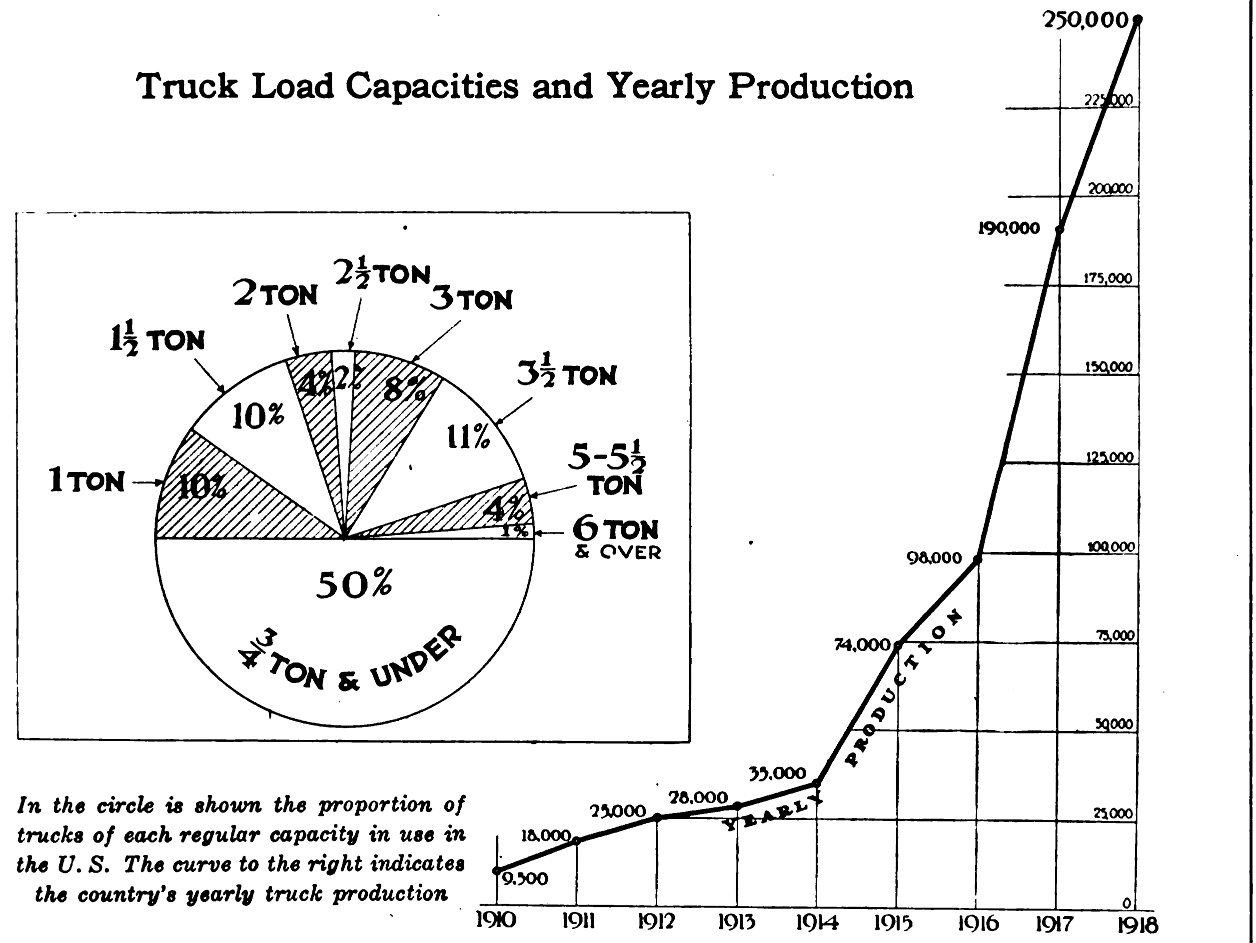
To remedy the existing state of things and to add considerably to the country's road mileage, it is probable that 1919 will see the creation of a Federal Highway Commission and a system of national highways, laid out, built and maintained by the Government as through trunk lines for commercial as well as military purposes. Good roads will enable the truck user to reach points which are now commercially inaccessible—good roads mean more, and yet more, trucks.

Since the truck has proved its position as an essential to the successful conduct of war overseas and has, in addition, been tried out under extreme conditions in time of national commercial stress at home—where it has fulfilled its mission with all credit—there can be no question as to its assured future. The only possible doubt is as to whether *any* limit can be set on its all round usefulness in doing its part in keeping the wheels of industry turning, or whether its future is, to all practical intents and purposes, limitless. There is no doubt but that in the almost immediate past we have had but little conception as to the value and efficiency of the truck. We know better now, but it is a question if we still realize the vast possibilities it holds in the development of highway transport.

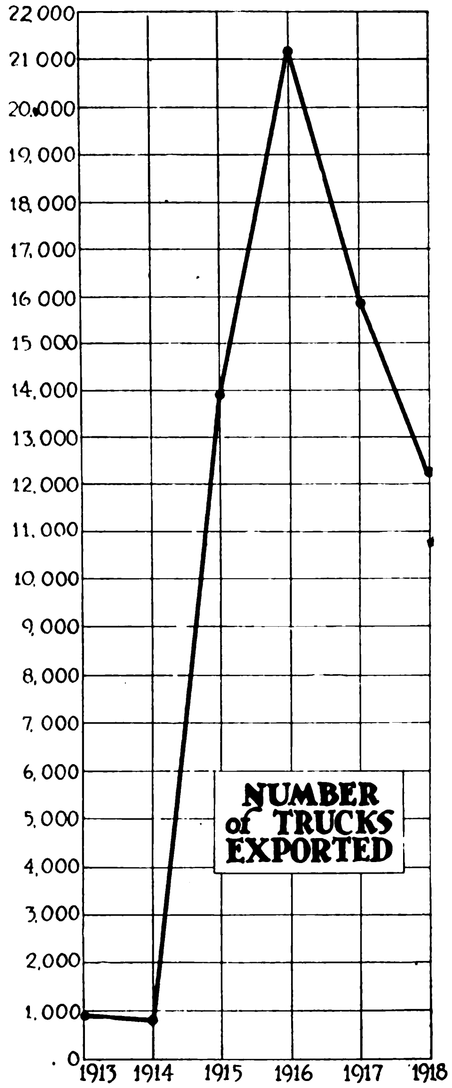
In this connection it is of interest to note the changes that are taking place in the matter of truck load capacities. These are referred to in detail elsewhere in this issue of AUTOMOTIVE INDUSTRIES. A recent compilation of the capacities of all the trucks in use in the country indicates that 50 per cent are of ¾-tons and under, 1 and 1½-ton trucks are each 10 per cent of the total, 4 per cent are 2-tonners, 2 per cent are of 2-ton capacity, 3-tonners represent 4 per cent, 3½-tonners are 11 per cent, 5 and 5½-tonners are 4 per cent and the remaining 1 per cent covers 6-ton trucks and over.

A summing up of the future of the truck needs but few words. Services already rendered show beyond the shadow of a doubt that the truck is not only capable of furnishing adequate service, but that it is an essential to transportation. Relatively, it is only in its infancy as a means of countrywide transport, and the day is not far distant when our truck trains will run on schedule both as connecting links between railroad systems and as independent carriers of high-speed, heavy-duty and low-cost type.

Truck Load Capacities and Yearly Production



In the circle is shown the proportion of trucks of each regular capacity in use in the U. S. The curve to the right indicates the country's yearly truck production



Nearly 22 Per Cent of Trucks

Exports Have Dropped During the Past Two Cultivation on

A CASUAL glance at the charts giving numbers and value of our exports of commercial vehicles for the past six years is amply sufficient to show that the truck manufacturers of the United States touched the peak of overseas trade at the period when the world-war and its demands on the manufacturing resources of England, France and Italy had caused the mobilization of every factory and machine shop in those countries on a munition-making basis.

It is true that a number of these factories continued to build trucks, but as the entire production was absorbed by the several governments for strictly military duties, the commercial needs of the various communities were ignored. As the railroads were fully occupied in war work, transportation in these countries would have been at a standstill were it

TRUCKS PRODUCED AND EXPORTED

Year	Number Produced	Number Exported	Percentage Exported

not for the trucks imported from the U. S. A.

In the case of Russia, a country without truck factories and with an incomplete railroad organization, the commercial vehicles purchased from us were essential to keep commerce moving even in a sub-normal way. Canada's American-built trucks were also sorely needed to replace the overworked railroads. In Latin American republics we have done well in the absence of European competition.

Now that we have passed the relatively artificial export peak created by war-time conditions, as shown by the falling off in our truck exports, there remains the question of maintaining our sales to foreign customers in the face of the intensive competition we shall have to face from a reconstructed Europe. There is no doubt whatever but that this can be accomplished and that the close of 1919 will see a decided improvement in our truck exports over that of 1918.

Although a steady increase may be expected in the domestic demand for trucks, it may be that production is now practically at a point where the export field must be developed to its full.

Note—The figures in italics show the number of trucks.

Austro-Daimler 200-Hp. Aircraft Engine

Part III

Metallurgical Test Data—Mechanical Test Data—General Data —Analysis of Weights

THE chemical compositions and the relative material strengths of the principal parts of the engine are given in the following chemical analysis and mechanical test reports:

(1) *Chemical Analysis*

Per Cent:	C.	Si.	Mn.	S.	P.	Cr.	Ni.

General Data

Make of engine and rated hp	Austro-Daimler 200-hp.
No. of cylinders	Six
Type number	8597
Bore	135.0 mm. (5.31 in.)
Stroke	175.0 mm. (6.89 in.)
Stroke/bore ratio	1.29:1
Area of one piston	143.1 sq. cm. (22.2 sq. in.)
Total piston area of engine	858.6 sq. cm. (133.1 sq. in.)
Swept volume of one cylinder	2504.9 cu. cm. (152.8 cu. in.)
Total swept volume of engine	15029.7 cu. cm. (916.8 cu. in.)
Clearance volume of one cylinder	623.1 cu. cm. (38.0 cu. in.)
Compression ratio	5.02:1
Normal b.hp. and speed	200 b.hp. at 1400 r.p.m.
Maximum ditto	222 b.hp. at 1600 r.p.m.
Normal b.m.e.p.	123.3 lb. per sq. in at 1400 r.p.m.
Maximum ditto	123.5 lb. per sq. in. at 1300 r.p.m.
Piston speed	1607 ft. per min.
Mechanical efficiency (calculated)	89.7 per cent
Indicated mean pressure (calculated)	137.5 lb. sq. in.
Fuel consumption per b.hp. hour	0.555 pint = 0.499 lb.
Brake thermal efficiency	27.4 per cent
Indicated thermal efficiency	30.6 per cent
Air standard efficiency	47.5 per cent
Relative efficiency	64.4 per cent
Cu. in. of swept volume per b.hp.	4.58 cu. in.
Sq. in. of piston area per b.hp.	0.665 sq. in.
Hp. per cu. ft. of stroke volume	377.3 b.hp.
Hp. per sq. ft. of piston area	216.6 b.hp.
Direction of rotation of crankshaft	Anti-clockwise
Direction of rotation of airscrew	Ditto
Type of gear reduction to airscrew	None
Ratio crankshaft speed/propeller speed	1:1
Type of valve gear	Overhead camshaft
Type of starting gear	Compression release

CARBURETERS

Number and type of carbureters	One dual Austro-Daimler
Diameter of choke tube	24.0 mm. (0.945 in.)
Bore of main jets	35.0 c.c. through per min.
Bore of pilot jets	5.8 c.c. through per min.
Fuel consumption per hour	111.0 pints = 100.0 lb.
Fuel consumption per b.hp. hour	0.555 pint = 0.499 lb.

GAS VELOCITIES, VALVE AREA, ETC.

Diameters

Induction pipe	59.0 mm. (2.32 in.)
Inlet and exhaust effective valve ports (each)	44.0 mm. (1.73 mm.)
Inlet and exhaust cylinder ports (each)	42.0 mm. (1.65 in.)

CROSS SECTIONAL AREAS

Induction pipe	27.33 sq. cm. (4.22 sq. in.)
Inlet valve (πdh) } each	13.69 sq. cm. (2.12 sq. in.)
Exhaust valve (πdh) } each	14.05 sq. cm. (2.18 sq. in.)
Exhaust branch pipes	38.25 sq. cm. (5.92 sq. in.)

MEAN GAS VELOCITIES

(1400 r.p.m.)

Induction pipe	141.0 ft. per sec.
Inlet valves	140.0 ft. per sec.
Exhaust valves	136.0 ft. per sec.
Exhaust branch pipe	100.5 ft. per sec.

INLET VALVES

Number per cylinder	Two
Largest diameter	48.0 mm. (1.89 in.)

(*Continued on page* 134)

NOTE:

Loading, Lbs. per H. P.—Gross Weight ÷ Actual H. P. developed at normal revs. (A suffix *R* shows that *Rated H.P.* has been used in absence of *Actual H.P.*)

Lifting Surface—Surface of Wings and Flaps only.

Military Load—Weight of Guns, Bombs, Ammunition, and Reconnaissance Load.

Air Endurance—At 10,000′ Alt. at full throttle, including climb.

Service Ceiling—Height at which rate of climb is 100 ft./min.

Weight Empty—Includes Cooling Water for water-cooled engines.

[1]With reconn. load, and gap covered with triplex.

[2]With reconn. load, but with gap open.

[3]With 14-20 lb. bombs and gap covered with fabric.

[4]With 14-20 lb. bombs, but with gap open.

[5]Without cabane and Lewis gun. [6]With cabane and Lewis gun.

[7]Two superimposed two-bladed D. G. B. 2610.

[8]With 2 Vickers guns only.

[9]With 2 Vickers guns and Lewis gun on top plane.

[10]With 2 Vickers guns and Lewis gun on cabane.

Comparative performance reduced to correspond with loadings of 14 lbs. per H.P. and 7 lbs. per sq. ft.

Austro-Daimler 200-Hp. Aircraft Engine

(*Continued from page* 132)

Effective valve port diameter	44.0 mm. (1.73 in.)
Width of seating	2.5 mm. (0.09 in.)
Angle of seating	45 deg.
Lift of valve	9.9 mm. (0.39 in.)
Diameter of stem	10.0 mm. (0.39 in.)
Length of valve guide	68.0 mm. (2.67 in.)
Overall length of valve	135.0 mm. (5.315 in.)
Number of springs per valve	One
Free length of spring	60.0 mm. (2.36 in.)
Length of spring in position (no lift)	46.0 mm. (1.81 in)
Mean diameter of coils	34.0 mm. (1.34 in.)
Diameter of wire	4.0 mm. (0.157 in.)
Ratio length of spring/lift of valve	4.61:1
Weight of valve complete with spring	0.50 lb.
Weight of spring bare	0.16 lb.
Inlet valve opens	10 deg. early
Inlet valve closes	30 deg. late
Period of induction	220 deg.
Inlet valve tappet clearance	0.25 mm. (0.01 in.)

Exhaust Valves

Number per cylinder	Two
Largest diameter	48.0 mm. (1.89 in.)
Effective valve port diameter	44.0 mm. = 1.73 in.
Width of seat	2.5 mm. (0.09 in.)
Angle of seat	45 deg.
Lift of valve	10.16 mm. (0.40 in.)
Diameter of stem	10.0 mm. (0.39 in.)
Length of valve guide	68.0 mm. (2.67 in.)
Overall length of valve	135.0 mm. (5.315 in.)
Number of springs per valve	One
Free length of spring	60.0 mm. (2.36 in.)
Length of spring in position (no lift)	46.0 mm. (1.81 in.)
Mean diameter of coils	34.0 mm. (1.34 in.)
Diameter of wire	4.0 mm. (0.157 in.)
Ratio length of spring/lift of valve	4.6:1
Weight of valve complete with spring	0.5 lb.
Weight of spring bare	0.16 lb.
Exhaust valve opens	45 deg. early
Exhaust valve closes	7 deg. late
Period of exhaust	232 deg.
Exhaust valve tappet clearance	0.304 mm. (0.012 in.)

Inertia Forces, Bearing Loads, Etc.

Weight of piston complete with rings and piston pin	4.18 lb.
Weight per sq.in. of piston area	0.188 lb.
Weight of connecting rod complete	4.84 lb.
Weight of reciprocating part of connecting rod	1.66 lb.
Total reciprocating weight per cylinder	5.84 lb.
Weight per sq. in. of piston area	0.263 lb.
Length of connecting rod (centers)	315.0 mm. (12.40 in.)
Ratio connecting rod/crank throw	3.6:1
Inertia lb./sq. in. piston area top center	63.8 lb./sq. in.
Inertia lb./sq. in. piston area bottom center	36.2 lb./sq. in.
Inertia lb./sq. in. piston area mean	25.0 lb./sq. in.
Weight of rotating mass of connecting rod	3.18 lb.
Total centrifugal pressure	610 lb.
Centrifugal pressure lb./sq. in. piston area	27.5 lb./sq. in.
Mean average fluid pressure including compression	47.0 lb./sq. in.
Mean average loading on crank pin bearing, total from all sources in terms of lb./sq. in. piston area	91.0 lb./sq. in.
Diameter of crank pin	56.0 mm. (2.20 in.)
Rubbing velocity	13.42 ft. per sec.
Effective projected area of big-end bearing	32.4 sq. cm. (5.02 sq. in.)
Ratio piston area/projected area of big-end bearing	4.42:1
Mean average loading on big-end bearing	402 lb./sq. in.
Load factor on big-end bearing	5400 lb./ft. sec.

Cylinders

Overall height of bare cylinder from top of base chamber	365.0 mm. (14.370 in.)
Depth of spigot at base of cylinder	15.0 mm. (0.590 in.)
Diameter of cylinder over water jacket	160.0 mm. (6.29 in.)
Thickness of flange at base of cylinder	11.0 mm. (0.433 in.)
Number of holding-down bolts per cylinder	Eight
Diameter of holding-down studs	4 of 14.0 mm., 4 of 19.0 mm.
Thickness of water jacket	1.0 mm. (0.039 in.)
Mean thickness of combustion chamber wall	5.0 mm. (0.197 in.)
Thickness of cylinder barrel (top)	4.0 mm. (0.177 in.)
Thickness of cylinder barrel (center)	3.0 mm. (0.138 in.)
Thickness of cylinder barrel (bottom)	4.0 mm. (0.157 in.)
Diameter of water connections between cylinders	36.0 mm. (1.42 in.)

Piston

Type of piston	Aluminum; internal ribs
Diameter at top	134.0 mm. (5.275 in.)
Diameter at bottom	134.58 mm. (5.297 in.)
Length	110.5 mm. (4.35 in.)
Ratio, piston length cylinder bore	0.82:1
Number of rings per cylinder	Three
Position of rings	Above piston pin
Width of rings	7.0 mm. (0.275 in.)
Gap of rings in cylinder	0.48 mm. (0.019 in.)

Connecting Rod

Length between centers	315.0 mm. (12.40 in.)
Ratio connecting rod/crank throw	3.6:1
Little-end bearing, type	Plain phosphor bronze
Little-end bearing, diameter	28.0 mm. (1.10 in.)
Little-end bearing, length	67.0 mm. (2.64 in.)
Little-end bearing, projected area	18.70 sq. cm. (2.90 sq. in.)
Ratio piston area/projected area little-end bearing	7.66:1
Big-end bearing, type	Bronze shell, lined white metal
Big-end bearing, diameter	56.0 mm. (2.20 in.)
Big-end bearing, length (actual)	67.0 mm. (2.63 in.)
Big-end bearing, length (effective)	58.0 mm. (2.28 in.)
Big-end bearing, projected area	28.4 sq. cm. (5.02 sq. in.)
Ratio piston area/projected area big-end bearing	4.42:1
Number of big-end bolts	Four
Full diameter of bolts	10.0 mm. (0.39 in.)
Total cross sectional area bottom of threads	2.04 sq. cm. (0.316 sq. in.)
Pitch of threads	1.5 metric
Maximum load due to inertia at 1400 r.p.m.	1390 lb.
Maximum load due to inertia at 1600 r.p.m.	1815 lb.
Load due to centrifugal force at 1400 r.p.m.	370 lb.

Load due to centrifugal force at 1600 r.p.m.	485 lb.
Total load on bolts at 1400 r.p.m.	1760 lb.
Total load on bolts at 1600 r.p.m.	2300 lb.
Stress per sq. in. at 1400 r.p.m.	5570 lb./sq. in.
Stress per sq. in. at 1600 r.p.m.	7280 lb./sq. in.

Crankshaft

Number and type of main bearings	Seven, bronze cage, lined white metal
Cylinder centers	166.0 mm. (6.53 in.)
Crankpins	
Outside diameter	56.0 mm. (2.20 in.)
Inside diameter	30.0 mm. (1.18 in.)
Length	68.0 mm. (2.67 in.)
Journals	
Outside diameter	58.0 mm. (2.28 in.)
Inside diameter (front two)	21.0 mm. (0.82 in.)
Inside diameter (others)	30 mm. (1.18 in.)
Length, propeller end	56.0 mm. (2.20 in.)
Length, rear end	43.5 mm. (1.71 in.)
Length, center	50.0 mm. (1.97 in.)
Length, intermediate	50.0 mm. (1.97 in.)

Crank Webs

Width	74.0 mm. (2.91 in.)
Thickness (front two)	24.5 mm. (0.96 in.)
Thickness (others)	24.0 mm. (0.94 in.)
Radius at ends of journals and crankpins	4.5 mm. (0.17 in.)
Weight of complete shaft	96.5 lb.

Working Clearances

Piston clearance top (total)	1.00 mm. (0.039 in.)
Piston clearance bottom (total)	0.42 mm. (0.016 in.)
Side clearance of connecting rod in piston (total)	2.50 mm. (0.098 in.)
Side clearance of connecting rod on crankpin (total)	1.00 mm. (0.039 in.)
End clearance of crankshaft in main bearings	2.00 mm. (0.079 in.)

Lubrication System

Number and type of oil pumps	One plunger
Oil consumption per hour	8.75 U. S. pints
Oil consumption per b.hp. hour	0.044 U. S. pint = 0.039 lb.
Oil pressure	50 deg. C.
Oil temperature	5 lb. per sq. in.
Specific gravity of oil	0.899
Ratio pump speed/crankshaft speed	1:15

Ignition

Number and type of magnetos	Two Bosch Z.H.6
Firing sequence of engine	Propeller 1-5-3-6-2-4
Ignition timing (fully advanced)	20 deg. E to 40 deg. E, variable
Number of plugs per cylinder	Two
Type of plugs	Bosch 3-point
Ratio magneto speed/crankshaft speed	1.5:1

Cooling System

Number and type of water pumps	One centrifugal
Diameter of inlet pipe	36.0 mm. (1.42 in.)
Diameter of outlet pipe	36.0 mm. (1.42 in.)
Diameter of rotor	112.0 mm. (4.40 in.)
Number and type of radiators	One honeycomb
Ratio water pump speed/engine speed	1.894:1
Water temperature inlet	54.5 deg. C.
Water temperature outlet	60.0 deg. C.

Air Pump

Type of air pump	Cam-operated plunger
Bore	38.0 mm. (1.496 in.)

Weights

Weight of complete engine, dry, with propeller boss and exhaust manifold	728.5 lb.
Weight per b.hp. ditto	3.64 lb.
Weight of fuel per hour	100.00 lb.
Weight of oil per hour	7.86 lb.
Total weight of fuel and oil per hour	107.86 lb.
Gross weight of engine in running order, less fuel and oil (cooling system) at 0.65 lb. per b.hp.	858.50 lb.
Weight per b.hp. ditto	4.29 lb.
Gross weight of engine in running order, with fuel and oil for six hours' running (tankage at 10 per cent weight of fuel and oil)	1570.4 lb.
Weight per b.hp.	7.85 lb.

Overall Dimension

Height	1150 mm.
Length	1724 mm.
Width	568 mm.

GENERAL ANALYSIS OF WEIGHTS

Description of part	No. per Set	Average unit weight in lb.	Weight of complete set in lb.	Percentage of total weight
Cylinders, bare	6	18.43	110.62	15.30
Detachable inlet valve pockets	6	1.06	6.37	0.87
Pistons, complete with rings	6	3.52	21.12	2.90
Piston pins	6	0.66	4.00	0.54
Connecting rods	6	4.84	29.04	3.98
Crankshaft	1	96.50	96.50	13.24
Inlet valves	12	0.34	4.12	0.56
Exhaust valves	12	0.34	4.12	0.56
Inlet exhaust valve springs	24	0.16	3.88	5.53
Valve collars and locking cones	24	0.09	2.19	0.30
Valve rockers (with bearings)	12	1.25	15.00	2.06
Camshaft	1	10.25	10.25	1.40
Camshaft casing complete	1	34.50	34.50	4.74
Half compression gear	1	2.69	2.69	0.36
Vertical camshaft driving spindle (complete)	1	6.81	6.81	0.93
Vertical spindle housing	1	1.62	1.62	0.22
Camshaft bevel sprocket	1	3.15	3.15	0.43
Crankcase, top half	1	107.00	107.00	14.68
Crankcase, bottom half	1	73.50	73.50	10.09
Bearing caps	7	2.27	15.93	2.19
Main holding-down bolts	14	0.75	10.50	1.44
Thrust race complete	1	5.28	5.28	0.72
Propeller hub	1	11.31	11.31	1.55
Carbureters	1	24.06	24.06	3.30
Induction pipes	2	4.25	8.50	1.16
Exhaust pipes	6	2.33	14.00	1.92
Oil pump	1	11.81	11.81	1.62
Oil leads with relief valve	1	4.56	4.56	0.62
Magnetos	2	14.37	28.75	3.94
High tension leads with casing	1	4.75	4.75	0.65
Magneto and throttle controls	1	2.12	2.12	0.29
Water pump	1	7.62	7.62	1.04
Water pipes	1	6.56	6.56	0.90
Air pump	1	1.62	1.62	0.22
Rev. counter drive	1	0.75	0.75	0.10
Gun gear with case	1	5.81	5.81	0.80
Miscellaneous parts	1	28.09	28.09	3.85
Total			728.50	100.00

† The total load of the Gourdou plane has been reduced to take account of the lightening provided by the manufacturer from 512 to 428 lb.

Officially Recognized Perform and Sea

With a Few Conspicuous Examples of Achievements Authentic, Have Not Been

THE airplane records which are tabulated on these two pages and the one following are those that have been compiled by the Aero Club of America. But while they are the recognized records of airplane performance and cover flights which have been officially observed and recorded both in the United States and in foreign countries, they do not by any means represent some of the more recent achievements of foreign and American pilots.

Obviously, the war has precluded the possibility of publishing specific information regarding the accomplishments of military aviators and machines. Nevertheless, authentic reports from outside sources reveal that many of the records on these pages are, in fact, records no more. When the final data are collected, checked and officially promulgated in the form of records, it likely will be found that at least half of the figures given herewith have been superseded.

In the meantime, a brief review of some of the more conspicuous performances will serve to show how extensive may be the changes in the records. For example, the American altitude record for seaplanes is given as 875 ft. in a plane carrying six persons. As a matter of fact, this record is beaten nearly every day by regular navy fliers who commonly attain altitudes of more than 3000 ft., carrying as many as 11 persons.

In the matter of distance and passenger carrying, it probably will be a long time before the recent record of the navy seaplane NC1 is approached, yet it is not officially chronicled. This plane flew from Hampton Roads to Rockaway Beach, N. Y., carrying 51 passengers.

Another record about which nothing has become public was a flight of three navy seaplanes completely across the continent. Three stock machines were assembled, and almost without preparation flown from the Atlantic to the Pacific by regular navy pilots.

The altitude record, too, has been broken since these figures were compiled. Whereas Capt. Schroeder in September reached an altitude of 28,500 ft., a British pilot on Jan. 2 drove an American plane carrying himself and an observer to an altitude of 30,500 ft. in 55 min. 15 sec.

Speed records, as well, have been bet-

World's Records

tered time and again. There was a conspicuous example of this only last week when Major-General Kenly flew from Washington to New York to attend the dinner of the Manufacturers' Aircraft Association. He came over in a De Haviland, covering the 270 miles between the Capital and Mineola in 99 minutes, which figures out at an average of 163 m.p.h. Still more recently, Lieut. Springer flew a Martin bomber, the first to be turned out, from Dayton to Cleveland, carrying a passenger, at the rate of 172 m.p.h. And it was considered quite an accomplishment when S. F. Kettering flew more than a month ago from Dayton to New York in a De Haviland equipped with a Liberty engine in 4 hr. 10 min., averaging 140 m.p.h.

Cross country records have long since gone by the boards. Take the case of the four army airplanes which only last week reached Mineola after having flown all the way from San Diego. They were in the air 55 hours, all told, during the 34 days required for the journey.

And in the middle of December, came news from England that for the first time the flight between England and India had been accomplished. Major A. S. MacLaren made the flight with one passenger in a Handley-Page machine equipped with four Rolls-Royce Eagle engines, covering the distance in five legs.

It is believed by many that a large portion of long distance records of the future will be held by seaplanes or flying boats, this for the reason that as long as they are over water they are sure of a landing place and thus are enabled to venture further than land machines.

Two long flights in navy seaplanes have recently been completed, one from the Naval Air Station at Pensacola and the other from Norfolk, Va. Lieut. T. C. Rodman, U. S. Marine Corps, on Dec. 30 flew 900 miles from the Pensacola station, carrying eleven passengers. The same day Lieutenant-Commander Bollinger, U. S. N., covered a distance of 651 miles from the Norfolk station without stop, carrying five passengers.

These, of course, are only random examples, and may not represent the ultimate that has been attained in any of these fields. Doubtless some of even these astonishing performances have been beaten and the results withheld for military or other reasons.

*Experimental machines. [1]Artillery destroyers. [2]Average of acceptance tests in August. [3]Six machine guns can be fitted. [4]Nine machine guns can be fitted. [5]The load of bombs can be increased by reducing the air endurance, which in practice will not exceed 5 hours. [6]Generally the air endurance is reduced, in order to increase the load of bombs. [7]The 16,500 ft. was attained with a load of 1,760 lbs. in 38 mins.

Developments in the Galician Oil Industry

INDUSTRY in general depends in so many ways upon the supply of mineral oil that every new development in the oil fields of Europe has an important bearing on the reconstruction of the industries of these countries. War requirements of lubricating oil for railway use made a greatly increased output from the wells of Galicia necessary. The effects of the increased demand continue, and in view of the possibly distant resumption of imports from the United States further efforts are being made to widen the available oil fields. A number of fresh borings have been started, and preparations are being made for others. Government help is afforded the prospectors by lending machinery and horses and by supplying them with wood and coal with a view to hastening the progress of the boring. The Galician wells yield an oil richer in the heavy constituents needed for a lubricating oil than those of the Boryslaw and Tustanovic districts, says the *Oesterreichische Chemiker- und Techniker-Zeitung*.

Tungsten Contact Points

IN a recent article in Electrotechnische Zeitschrift by H. v. Fleischbein, the author explains the general difficulties in making relay contacts, and the troubles met with even when using platinum, through dirt, burning or welding together of the contacts. A series of experiments has resulted in the construction of contacts of tungsten that are superior to contacts of platinum.

The main difficulty in using tungsten lies in the fixing of the tungsten to the supporting spring. This has been successfully overcome by a process of electric spot welding. Care has to be taken that the material of the spring does not overheat and allow the tungsten contact to be pushed through it. As tungsten is a poor conductor of electricity, the heating at the contacts is greater than with platinum, and on this account it is advisable to make the contacts as short as possible. Under certain circumstances artificial cooling must be resorted to.

Engines Used by Royal Naval Air Service

(WAR AND SCHOOL USE)

Engine	Used in Aeroplane	Seaplane	Remarks
90 H.P. Anzani	Caudron (School)	....	Early type radial engine used for school purposes.
150 H.P. A. R. 1	Bristol Mono.	A.D. Navy plane	Latest design Rotary engine. Only two in use at present.
120 H.P. Austro Daimler (Beardmore)	....	W. & T. F. Boat	Chiefly used by R. F. C.
135 H.P. Canton Unne	Henry Farman	Short S.830	Water-cooled stationary radial, no further engines being ordered.
200 H.P. Canton Unne	....	Short S.166	Water-cooled stationary radial, no further engines being ordered.
80 H.P. Clerget	Sopwith 9901 (Pup)	....	Seven-cyl. It is understood that the manufacture of this engine is being stopped in favor of the 80 Rhone.
110 H.P. Clerget	Sopwith 9400 S	Sopwith Baby	
110 H.P. Clerget	Sopwith 9400 L	....	
110 H.P. Clerget	Sopwith 9700	....	9-cyl. Rotary; to be superseded by 130 H.P. Clerget.
110 H.P. Clerget	Sopwith Triplane	....	
110 H.P. Clerget	Nieuport 2-Seater	....	
130 H.P. Clerget	Sopwith F1	Hamble Baby	
130 H.P. Clerget	Nieuport 2-Seater	....	
130 H.P. Clerget	Nieuport Single	....	
130 H.P. Clerget	A. W. Quad	....	9-cyl. Rotary, used largely by both services.
130 H.P. Clerget	Nieuport Triplane	....	
130 H.P. Clerget	....	Sopwith Imp Baby	
130 H.P. Clerget	....	White Type 4	
90 H.P. Curtiss	B.E. 2.C.	....	8-cyl. V water cooled; school use.
90 H.P. Curtiss	J.N. 3.	....	
90 H.P. Curtiss	J.N. 4.	....	
160 H.P. Curtiss	Curtiss R.2.	....	8-cyl. V water cooled; being developed to give greater power and reliability, in America.
80 H.P. Gnome	Avro Scout		
80 H.P. Gnome	Avro 179 type	....	7-cyl. Rotary chiefly used for school purposes.
80 H.P. Gnome	Bristol Scout	....	
100 H.P. Gnome Mono	Bristol Scout	Sopwith Baby	
100 H.P. Gnome Mono	Avro Scout	Sopwith Schndr.	9-cyl. Rotary, not likely to be used for war purposes in future.
100 H.P. Gnome Mono	....	F.B.A.F. Boat	
100 H.P. Gnome Mono	....	P.V. 2.	
150 H.P. Hispano	Spad	Maurice Farman	8-cyl. V water cooled; a modern type based on latest principles.
200 H.P. Hispano	....	A.D.F. Boat	Similar engine to above but fitted with reduction gear to propeller.
90 H.P. R.A.F.	B.E.2.C.	....	8-cyl. V air cooled, school purposes only
70-75 H.P. Renault	B.E.2.C.	....	8-cyl. V air cooled, school purposes only.
70-80 H.P. Renault	M. Farman, long	....	8-cyl. V air cooled, school purposes only.
70-80 H.P. Renault	M. Farman, short	....	
150 H.P. Renault	Farman F.40	....	8-cyl. V water cooled, comparatively few of these engines in service.
240 H.P. Renault	....	Short 184	12-cyl. V water cooled, being used for two-seater seaplanes.
60 H.P. Rhone	G.W. 1600 type	....	7-cyl. Rotary, school purposes only, being superseded by 80 H.P. Rhone.
80 H.P. Rhone	Sopwith 9901	....	9-cyl. Rotary, school purposes and single seater fighters.
80 H.P. Rhone	Nieuport 1 seater	....	
75 H.P. Rolls-Royce	B.E.2.E.	....	6-cyl. vertical, water cooled, school purposes and small airships.
190 H.P. Rolls-Royce	De Havilland 4	A.D.F. Boat	12-cyl. V water cooled; now being developed to give 260 H.P.
190 H.P. Rolls-Royce	Fairey Fighter	Blackburn Twin	Two 190 H.P. engines in Fairey fighter and Blackburn Twin.
190 H.P. Rolls-Royce	....	Fairey type 3	
250 H.P. Rolls-Royce	De Havilland 4	Large America	12-cyl. V water cooled; now being developed to 360 H.P. Two 250 H.P. engines in large America Three 250 H.P. engines in Porte Boat. Two 250 H.P. engines in Handley Page.
250 H.P. Rolls-Royce	Handley Page	Porte Boat	
250 H.P. Rolls-Royce	....	Fairey Campania	
250 H.P. Rolls-Royce	....	Wight Convert	
150 H.P. Sunbeam	....	Avro Tractor Short S.8.27	8-cyl. V water cooled. Now out of date.
200 H.P. Sunbeam	A.W. Biplane	....	12-cyl. V water cooled; now being developed to give increased H.P.
200 H.P. Sunbeam	Parnall Night Flyer	....	
200 H.P. Sunbeam	Sunbeam type 7	....	
225 H.P. Sunbeam	....	Short 184 Short 184 single bomber	12-cyl. V water cooled; out of date.
240 H.P. Sunbeam	....	Short 184 Short 184 single bomber	12-cyl. V water cooled; will be superseded by later Sunbeam
320 H.P. Sunbeam	H.P. Triplane	Short 320 H.P.	12-cyl. V water cooled; used in large 2-seater seaplane.
		Cruiser Seaplane	Two 320 H.P. engines in cruiser seaplanes.

The above table contains the first published list of all engines used by the British Navy in airplanes and seaplanes and seems to be arranged on a chronological basis. This is indicated by the fact that the Austro-Daimler engine, which had been adopted in England previous to the war, appears high up in the list. In the early part of the war the British Navy seems to have pinned its faith mainly to rotary types of engines, while later the V type engine came to the front

British Airplanes

Principal Types of Engines and Air Service and

Airplanes in Use in Royal Naval Air Service

(*NOT* INCLUDING EXPERIMENTAL TYPES)

Machine	Engine	Duty
Avro.	80 Gnome.	Both 2-seater and single-seater, used exclusively for school (training) work.
B.E. 2.	75/80 H.P. Renault.	Two-seater tractor, used as a training machine, also as a night flyer for home defense against Zepps. A few also still used for reconnaissance patrol in the Eastern Mediterranean.
-c, d, & c.	90 H.P. R.A.F.	
Bristol Scout.	80 & 100 H.P. Gnome.	Originally used as fast single-seater fighter. Now becoming out of date, and only used for advanced training purposes.
Caudron.	100 Anzani & 80 Gnome.	Two-seater tractor. Used only as school machine.
Curtiss J.N. 3 & J.N. 4.	90 H.P. Curtiss.	Two-seater tractor. Supplied from America as a "reconnaissance machine." Only used for training purposes in this country.
Curtiss R.2.	160 Curtiss being replaced in this country by 200 Sunbeam.	Two-seater tractor. Has a good performance and carries a useful load of bombs. On completion of alteration of engine may be used on active service for bombing raids.
De Havilland 4	190 & 250 H.P. Rolls-Royce.	An army type machine now being built for R. N. A. S. Large two-seater tractor, used for fighting and reconnaissance patrols. Of very good performance.
Farman F.40.	150 Renault.	A large two-seater "pusher." Supplied from France, and used in this country for gunnery, training, etc.
Graham White.	60 H.P. LeRhone & 80 H.P. Gnome.	An elementary school training machine (being replaced by Maurice Farmans).
Handley Page.	2-250 H.P. Rolls-Royce.	A very large three-seater bombing machine. Used for bombing raids.
Henri Farman.	135 H.P. Canton Unne.	A large "pusher" machine chiefly used in the Mediterranean for bombing and fighter patrols. Now becoming obsolete.
Maurice Farman.	75 & 80 H.P. Renault.	The standard machine used in the R. N. A. S. for elementary training.
Nieuport.	80 LeRhone, 110 & 130 Clerget.	Both single- and two-seater. The earlier types of 80 H.P. engines are now obsolescent. Used as a fast fighter and "chaiser."
Sopwith (a) "1½ Strutter."	110 & 130 Clerget.	Both single-seater and two-seater. Single-seater used as a bomber, the two-seater as a "fighter reconnaissance machine." One of the best machines in 1916. Now obsolescent.
(b) "Pup."	80 H.P. LeRhone.	Single-seater fighter. Very fast and with excellent climb. Used very considerably during 1916 in France, this machine is now outclassed by the latest Sopwith, Nieuport & Spad fighters, and is becoming obsolete. Will be used for higher training. Also for ship use, flying off the deck.
(c) "F1" or "Camel."	130 Clerget.	The latest Sopwith single-seater fighter Only just produced, and not yet available in quantities.
(d) Triplane.	130 Clerget.	A single-seater fighter of great speed and climbing powers. The last machine produced by Sopwith before the "Camel."
"3pad."	150 & 200 H.P. Hispano-Suiza.	A French machine. A single-seater fighter. Only lately produced and not yet available in quantities. 200 H.P. machine has a better performance in the way of speed and climb than any machine yet produced.
Short.	250 Rolls-Royce & 240 Sunbeam.	A large two-seater land bomber. Carries a great weight of bombs, but has poor speed and climb and is therefore vulnerable, and is becoming obsolete. A few still used in France.

and Seaplanes

Planes in Use in the Royal Naval in the Army

Seaplanes in Use in Royal Naval Air Service

(*NOT* INCLUDING EXPERIMENTAL MACHINES)

Machine	Engine	Duty
Large "America" Flying Boat.	2-250 H.P. Rolls-Royce or 2-320 H.P. Sunbeam.	A large three-seater boat for reconnaissance and patrol work from coast stations.
Small "America" Flying Boat.	2-125 H.P. Anzani.	A small edition of above. Now obsolescent, and only used for training.
A.D. Flying Boat.	200 H.P. Hispano-Suiza.	A medium flying boat designed in Air Department, hence the name. The first has only just been completed, and the machine will not be available in quantities for four months. For fleet reconnaissance work from seaplane carriers.
Blackburn Twin.	2-100 Rolls-Royce.	A large twin-engined 2-float seaplane. The first has just completed trials, and a further twenty ordered but will not be available for some months. For reconnaissance and coast patrol with bombs. Or would carry a torpedo.
"Baby" Seaplane.	110 & 130 H.P. Clerget.	A small single-seater seaplane for fighting and attack of Zepps. There are various types, all differing only in detail, e.g., Sopwith "Baby," Hamble "Baby," Blackburn "Baby."
Fairey "Campania."	250 H.P. Rolls-Royce.	A 2-float seaplane designed for use in seaplane carriers. Carries eight hours' fuel, and to be used for fleet reconnaissance. First machine just completed trials and will not be available in quantities for some months.
M. Farman.	150 H.P. Hispano-Suiza.	After standard Maurice Farman practice, but with floats. 50 on order, but none yet delivered. For training and for coast patrol, etc.
"Porte Boat."	3-250 H.P. Rolls-Royce.	The largest type flying boat. Designed by Wing Commander Porte. Has not proved so handy as the "Large America" type and no more are being ordered after the ten now on order are completed.
Short.	150 H.P. Sunbeam. 125 H.P. Canton Unne.	Two of the earlier pattern Short seaplanes. Now only used for training.
	225 H.P. & 240 H.P. Sunbeam.	The standard 2-float seaplane at present in use in R. N. A. S. Used for reconnaissance and submarine patrol from coast stations.
	240 H.P. Renault.	Also from seaplane carriers. Also for higher training.
	320 H.P. Sunbeam.	The latest short seaplane, designed as a torpedo carrier. Also used for patrol work. Only two or three machines delivered at present. Will not be available in quantities for some months.
"Wight" (J. S. White of Cowes).	250 H.P. Rolls-Royce.	Originally designed as a land-bombing machine. Sixteen out of the twenty are being converted into seaplanes. The first so converted has given a very good performance, and a further fifty will be ordered. Will not be available in quantities for some months. Used similarly to the 225 & 240 Short.
White & Thompson and "F. B. A." Boats.	100 H.P. Gnome and 120 H.P. Austro-Daimler.	A small flying boat, now only used for training purposes. The F. B. A. was originally a French machine, but is built in this country by the White & Thompson Co.

The above table gives a list of the seaplanes in use by the British Navy with their engines and a brief general description of each type. The table is arranged alphabetically according to the names of the planes. It will be seen that the horsepower of seaplanes so far built ranges from 110 to 750, but it is stated that the large 750 hp. Porte seaplane has been discarded, it having proved less manoeuverable than the 500 hp. American plane

ALTHOUGH the airplane branch of the automotive industry is relatively in its infancy, our exports of parts and complete planes have already touched substantial figures, with the promise of further increases as the development of commercial airplane service proceeds. In the case of parts, our exports valued at $25,802 in 1913 have increased to a value of $8,877,977 in 1918. The widely extended field of our foreign sales both of airplanes and parts augurs well for the future, as it is evident that in the earlier years many planes and their parts were purchased for experimental purposes. In many of the countries, notably the Republics of Latin America, national movements are being made to develop postal and general commercial service. The figures in italics denote the number of airplanes shipped.

Future Production Plans Will Require Special Machinery

Tractor, Truck and Car Fields Soon to Be on Largest Production Scale

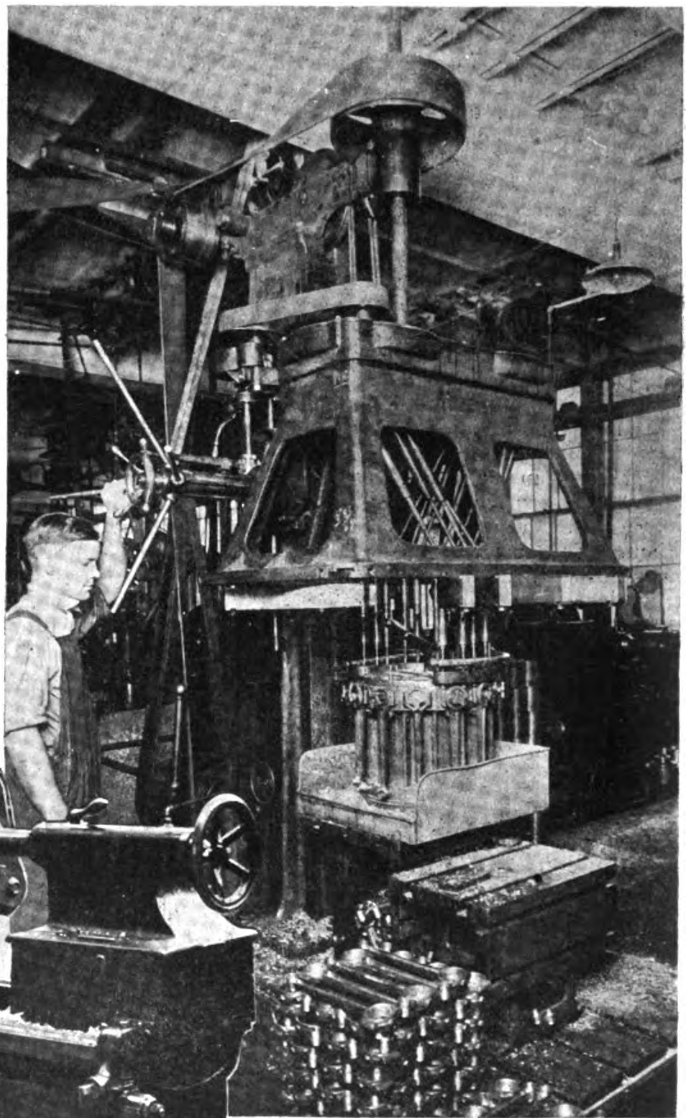
Special Jigs, Tools, Gauges Also Necessary to Fit Into Efficient Production Scheme

By J. Edward Schipper

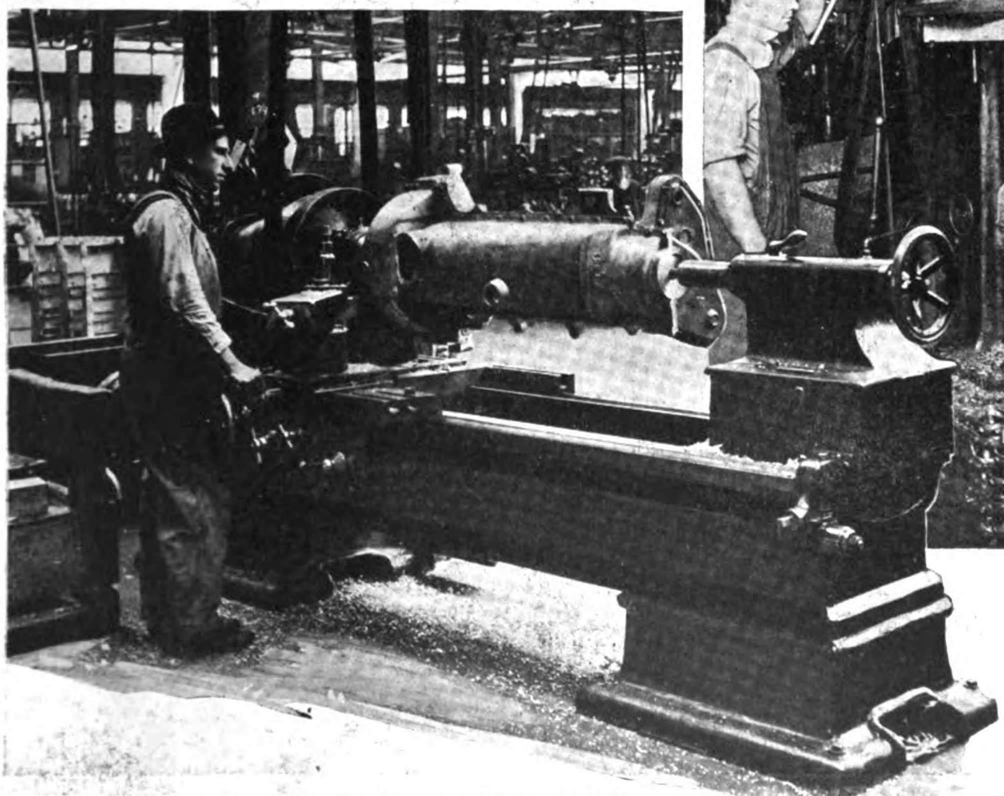
AUTOMOTIVE manufacture is still to enter its most active period. In the past all the big production companies have been in the automobile field. Ford, Overland, Buick, Dodge and other great concerns have carried the art of automobile manufacture to such efficiency that the overhead per car has been reduced to a degree where prices have dropped far below what would have appeared possible a decade ago.

With quantity production in the automobile field as a stepping stone, the era of great production and low prices is going to spread into the other branches of the automotive industry. It is certain that we are only on the eve of a great tractor move which will rival, if not surpass, the productive efforts of the automobile factories. A production of 300 farm tractors per day is now considered large. Yet this production will not begin to be a factor in some of the factories that are sure to spring up within the next 5 years.

Behind all this development in the manufacturing field there lies another development just as significant and without which the manufacturing development could not go on. This is the introduction of more special machinery particularly adapted to the wants of the automotive field. More and more the need for machinery built to fit a situation, or to form a link in the



Machining connecting-rods. On a machine of this kind several rods can be drilled at once by means of the rotating jig



Special high-center lathe used for machining bell housings

chain of manufacturing units designed for quantity production, has made itself felt.

Not so long ago we looked with unusual interest on a drill press or multiple-spindle drill which would drill thirty-two holes at a time, each one perfectly centered and in the same time formerly required to drill a single hole.

Not long after the development of the multiple-spindle drill, we became accustomed to the railway drill where a row of the multiple-spindle drilling machines built along a railway took care of all the milling and reaming and tapping on a piece of work which passed along below them on a track, carried by a swinging jig which brought the work into position and guided the tools.

With giant strides the machine-making industry, guided by the requirements and by the ingenuity of the production men, has overcome difficulties and progressed in quantity manufacture, until to-day we stand at a point where we can see that a concern which enters a field of competitive price must be well fortified by a highly efficient production scheme. This means special machinery, worked out to a degree even beyond what we have to-day in the great automobile factories.

It is necessary that the factory which goes into a low-priced field practically eliminate the work of the human hand and replace it by the work of human brains, and machinery. This does not mean a decrease in the necessity for labor, because it is a fact that those concerns which have gone furthest in the use of special production machinery and methods, have also gone furthest with the ideas of profit-sharing and welfare, and are, furthermore, the largest employers of labor.

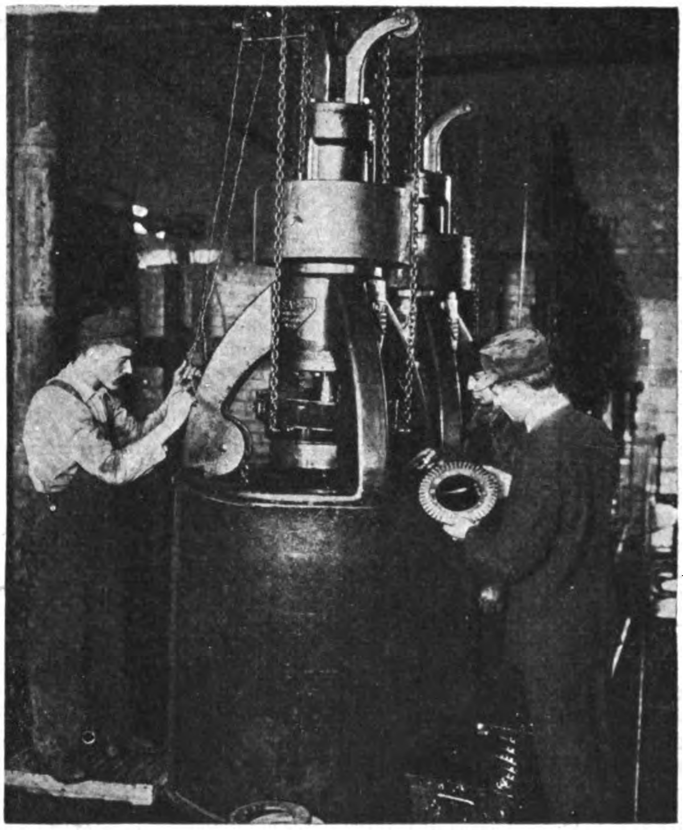
The supremacy of America in the manufacturing field depends on the efficiency of her manufacturing methods. America's labor is paid more than the labor of other countries, and the only way to offset this in the markets of the world is by such efficient production that the labor cost per unit and the overhead cost per unit are cut to a minimum. Machines that will do the same work or better work and will do it much more rapidly and accurately are going to be in demand in the automotive industry as never before.

It is beyond the powers of anyone to predict exactly what the tractor industry is going to be. Beyond the tractor industry, we can see on the horizon the airplane industry looming up in an embryonic stage but carrying behind it the thought that never has an improvement in transportation been discarded. Some day air transportation will come into its own.

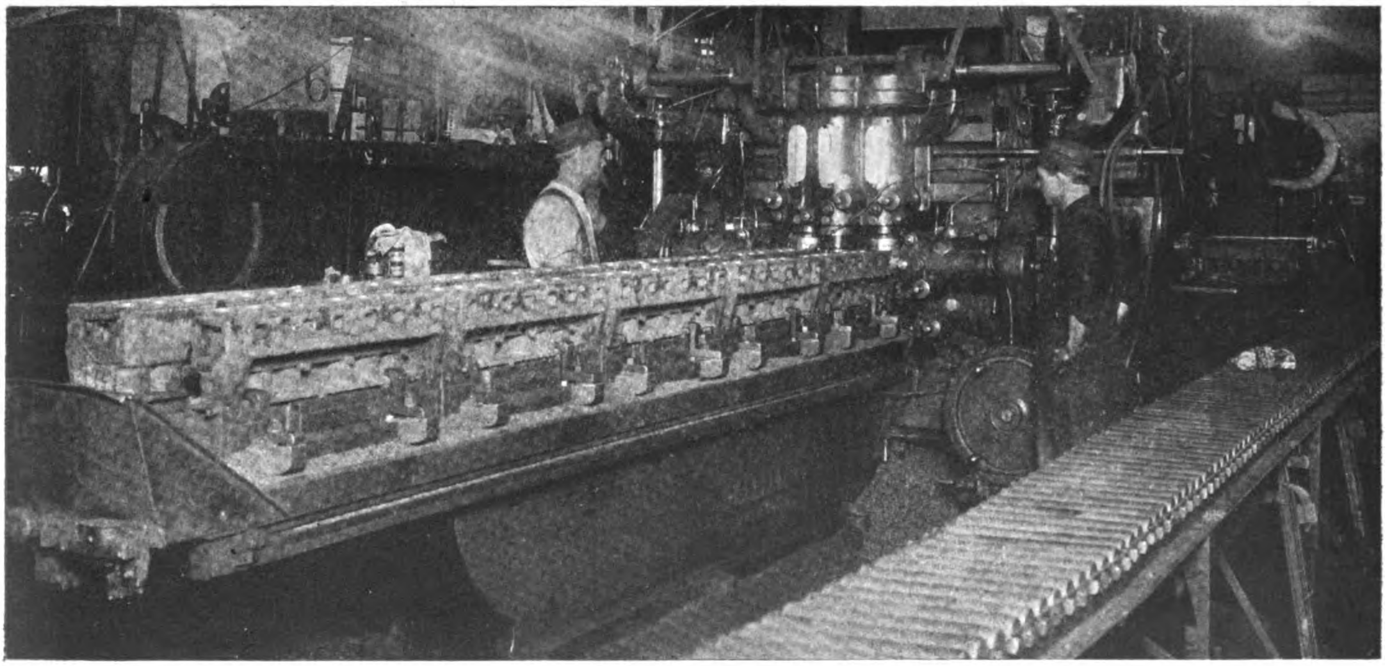
The internal combustion engine and the transmission parts with which it must be associated in the production of automobiles, trucks, tractors, airplanes, farm lighting equipment, and all the various other helps for humanity which have been rendered possible by the self-contained powerplant, lend themselves particularly well to the big production idea. In order to bring these essentials within the reach of every human being they must be low in price, and in order that they be low in price they must be produced in quantities.

Carrying this still further, production in quantity means that we must have special machines adapted for the particular work and fitting into the factory system as a part of its design.

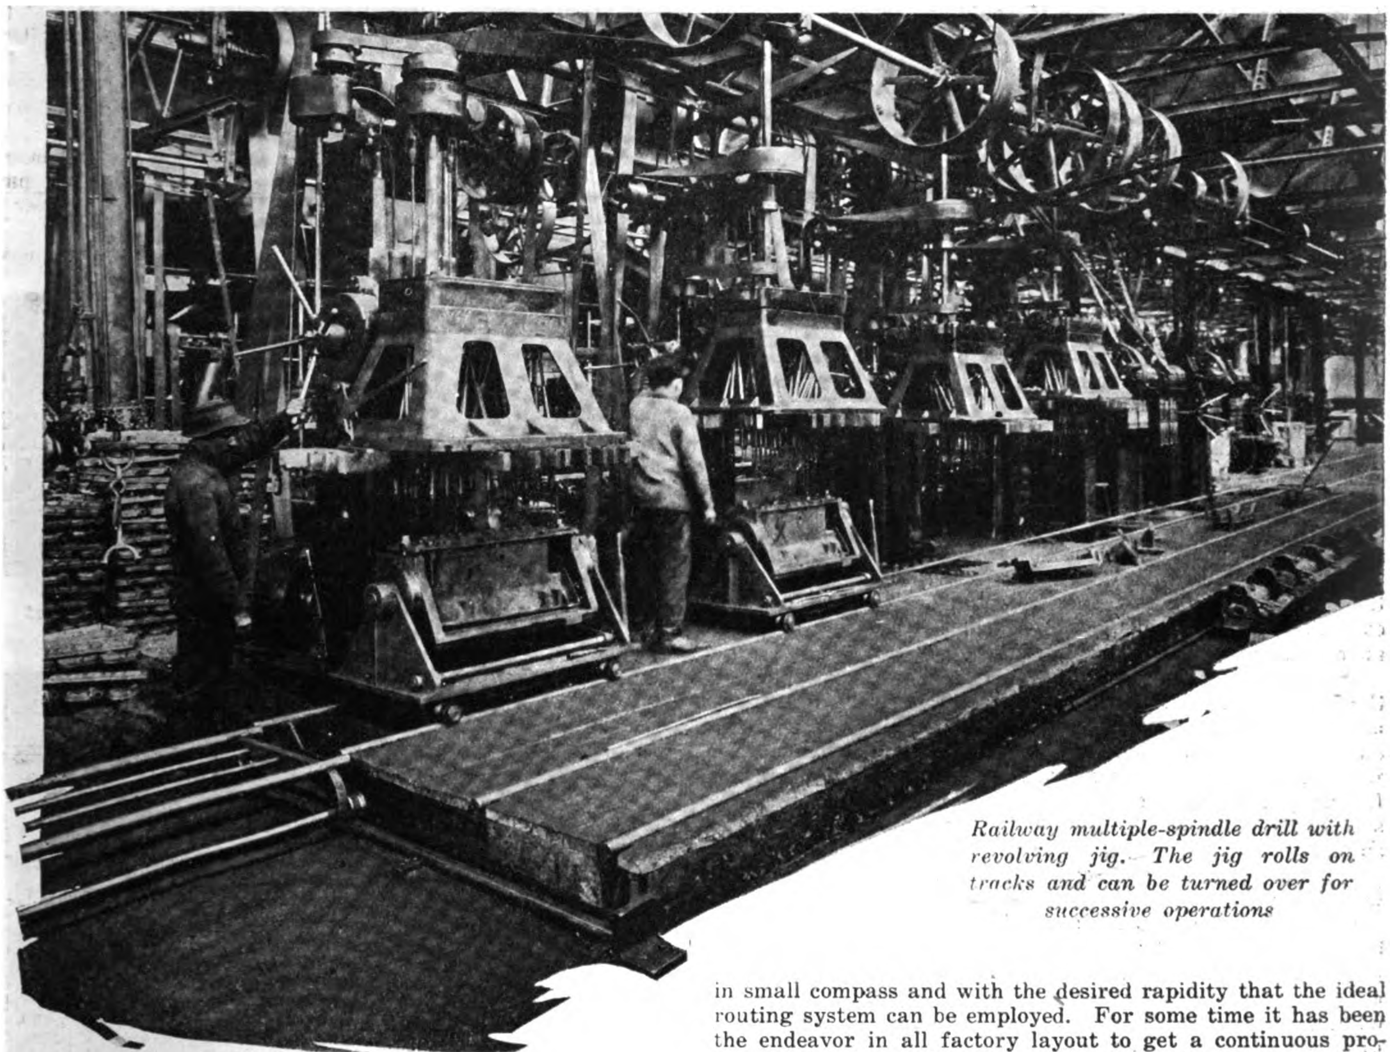
It is only by the use of machinery which handles its work



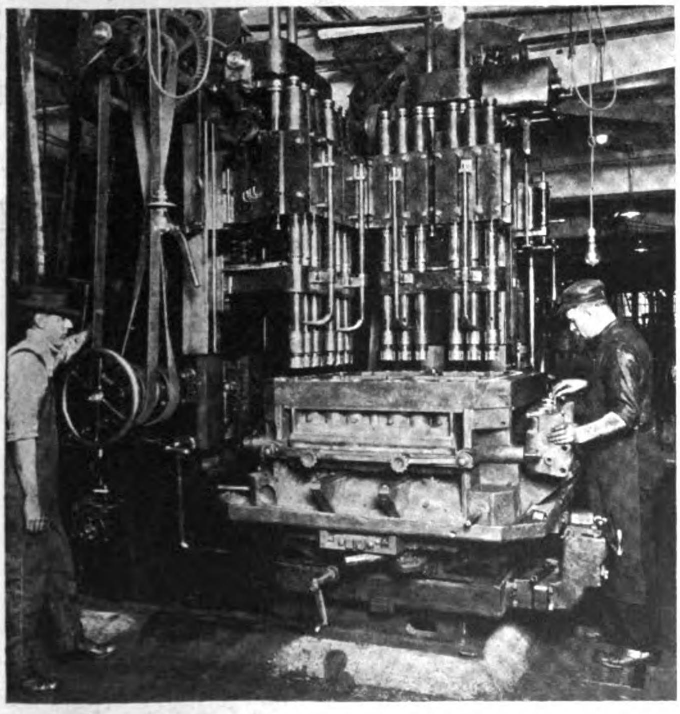
Gear hardening machine used by Dodge Brothers which automatically controls the oil treatment



An example of a machine with a long table. This faces the blocks for the Packard cylinders and handles ten blocks at a time



Railway multiple-spindle drill with revolving jig. The jig rolls on tracks and can be turned over for successive operations



A multiple boring machine in which the work proceeds continuously over to the rotating table. One block is set up while the operations are going on on the others

in small compass and with the desired rapidity that the ideal routing system can be employed. For some time it has been the endeavor in all factory layout to get a continuous progression of the work, so that at no time does it double back on itself or recross its path. Very often the limitations of machinery have compelled deviations from ideal routing, and one of the purposes of special machinery is to allow manufacture to conform to the ideal progression method.

It is of particular interest that the machinery for automotive apparatus must have the same fundamental characteristics. It makes little difference if the cylinders which must be bored are intended for automobiles, trucks, or tractors. The same fundamental cylinder boring tool is used for each. In the same way the connecting-rod end with its reaming and other manufacturing steps is handled identically regardless of whether these connecting-rods are used for farm lighting equipment or for mail trucks.

The methods of aligning the work and handling it in the most expeditious manner are the same. Crankcases produce about the same set of problems whether they are intended for one type of engine or another. They all have main bearings which must be aligned and camshaft bearings which must be treated in the same manner. And so it is throughout the entire engine parts field.

What must be done for a part of one type of engine must be done for a corresponding part of another type, so that the special machinery field in engine manufacture, although it must be to specialized design as far as installation dimensions are concerned, must also be of more or less standard nature, fundamentally.

It is not in manufacture alone that the special machine has come into its own. Testing machinery which carries the art of inspection down to its final limit is just as important. For instance, it is impossible to test a spring manually. A machine must be designed to do the work. Dodge Brothers have a machine that tests springs and does nothing else. For 24 hr. a day this machine rocks the car spring back and forth, hour after hour, day after day, constantly exerting on

it a pressure far greater than it would be subjected to under an automobile body.

The overload pressure is applied on this spring at the extreme rate of 155 vibrations per minute, until the spring has absorbed more shock than it would be called upon to survive in long years of actual service. With a conservative number of miles per year as a basis, it has been shown that some of the springs subjected to this test would last 60 years.

There are other machines of types which are quite different from those used for manufacturing or testing. For instance, there is a machine used by the Continental Motor Corp. which sand-blasts small parts. This is a table sand-blast in which connecting-rods, and all sorts of small engine parts can be piled and after a single revolution of the table they come out with a sand-blasted finish which would have taken an operator in a sand-blast cage hours of individual handling to have finished.

Still another field is that of gear hardening. In several automobile factories a hardening press is employed which is an excellent example of the adaptation of a special machine. This machine is in the form of a large tank in which a supply of oil is kept at a constant level and temperature. The rear axle driving gear goes into this tank, while held rigidly between two presses which act as an effective safe-guard against the natural tendency of the hot gear to warp when it comes in contact with the liquid. The oil solution of course brings the gear to the proper degree of hardness.

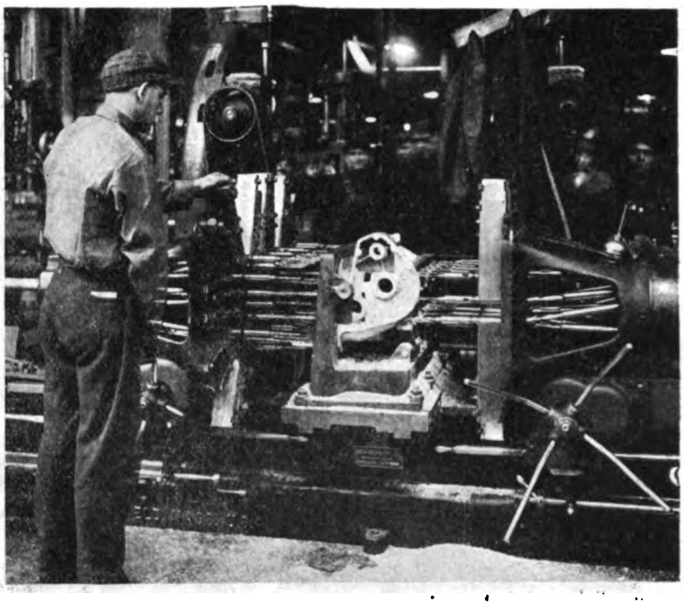
These are only a few specific examples of what is typical of the entire field. Even in the matter of jigs and fixtures, there is a tremendous industry that could exist on the needs of the automotive industry alone. In the larger establishments these jigs and fixtures are generally designed and worked out in the factory itself to fit the peculiar needs of the product and the scheme of manufacture. But they are in reality a part of the special machinery. By the use of the proper jig, the full benefit of the machine is reached, and the amount of manual work is cut to the limit.

Nowhere is the need for specially designed fixtures so well brought out as in testing or inspection apparatus. Fixed gages for the determination of accuracy can be made up to not only give a much closer check on the work, but also to make that checking much more rapid. This was exemplified to a marked degree in the manufacturing work of the Liberty engine. In no products except perhaps precision instruments have the limits been held so close and fixed in so many directions as they were in the Liberty engine. The use of a large number of especially designed gages was responsible in no small degree for the rapid manufacture of these engines in spite of the great accuracy required. Special machinery, special jigs and special fixtures, supplemented by the especially designed gages, leave no room for the human element which is the foe to interchangeability in manufactured products.

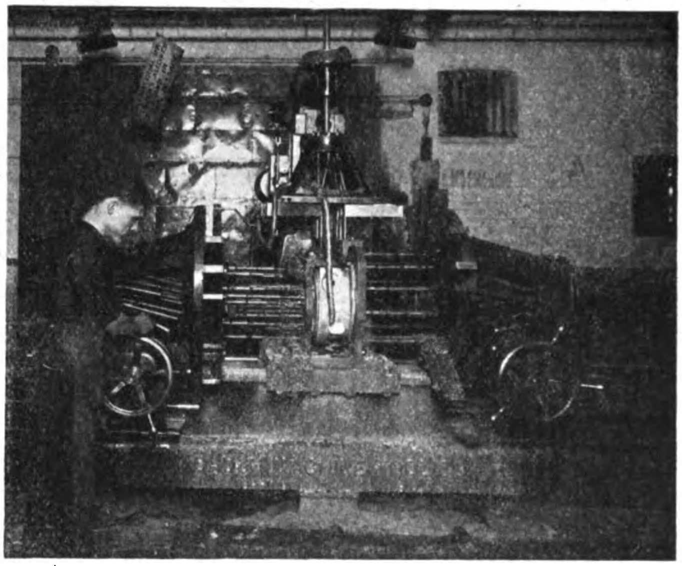
Industry is at the present time entering into a period of readjustment during which the problems of future manufacture are being closely studied. There are a number of concerns which are just about to enter quantity manufacture on products they have never touched before. This is due largely to experience gained in the war.

For example, take the Atwater-Kent company of Philadelphia. During the war the government asked this concern, owing to its experience in making small parts accurately, to enter the manufacture of prism binoculars for the army. This concern had never touched lens grinding, nor the manufacture of the small parts necessary for optical instruments, yet by the aid of new methods and modern machinery, it was soon turning out binoculars superior to those of German manufacture. Now that the war is over, this concern will not abandon the optical department, but will go ahead on a large commercial scale with this branch of manufacture.

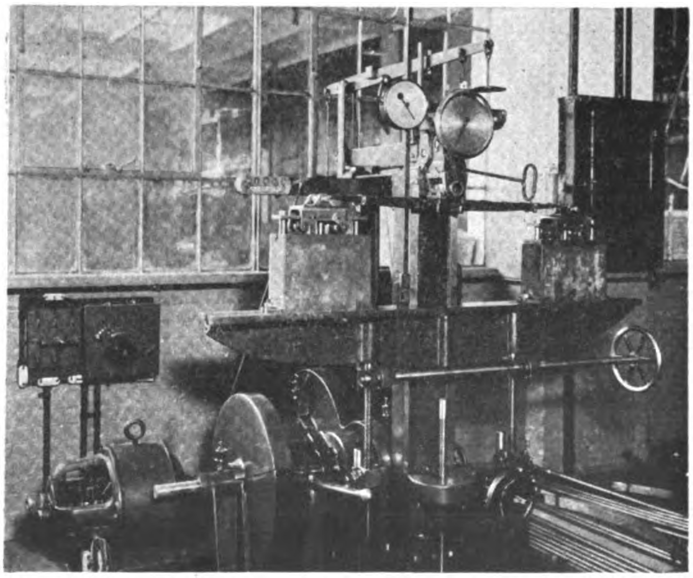
This is only one example picked from scores and illustrates how this new era upon which we are entering is going to make felt a demand for new equipment, new machinery, and new factory methods. Not in every case, however, are concerns going on with the work which was given them by the war department. They are going to swing back in most cases to their own line on an enlarged scale.



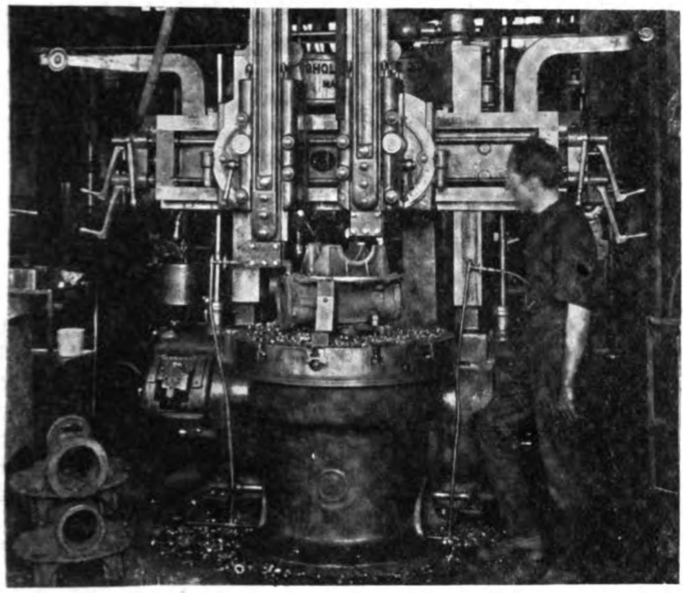
Drilling both sides of a Continental engine crankcase at the same time by means of a special drill and jig



An example of multiple-spindle drill which drills from three sides at the same time



Spring testing machine used by Dodge Brothers



The cutting operations can be handled rapidly on the largest of castings with this late type of machine

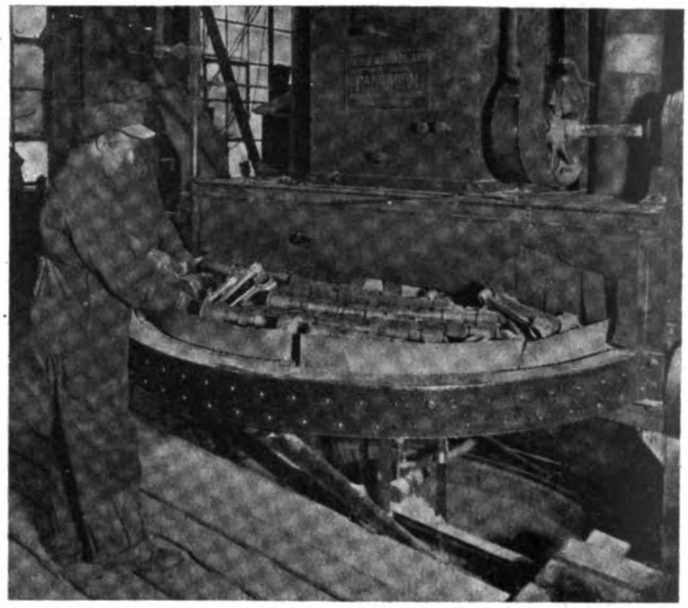


Table sand-blast machine which automatically puts sand-blast finish on a large number of small parts

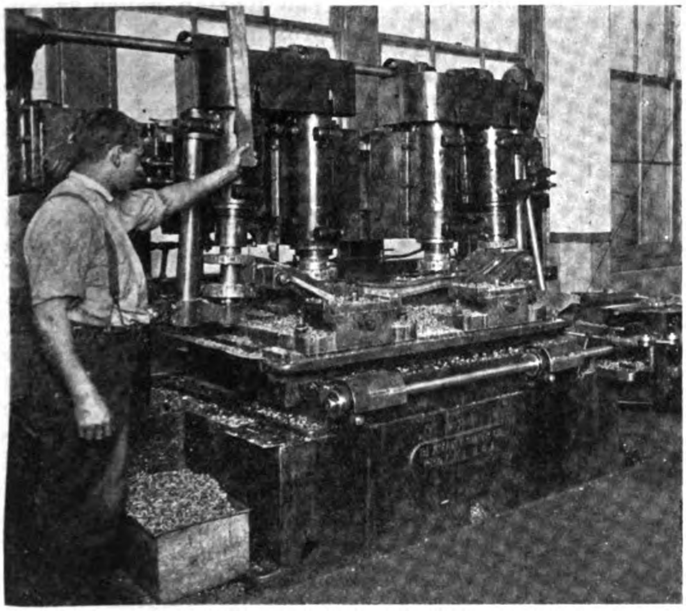
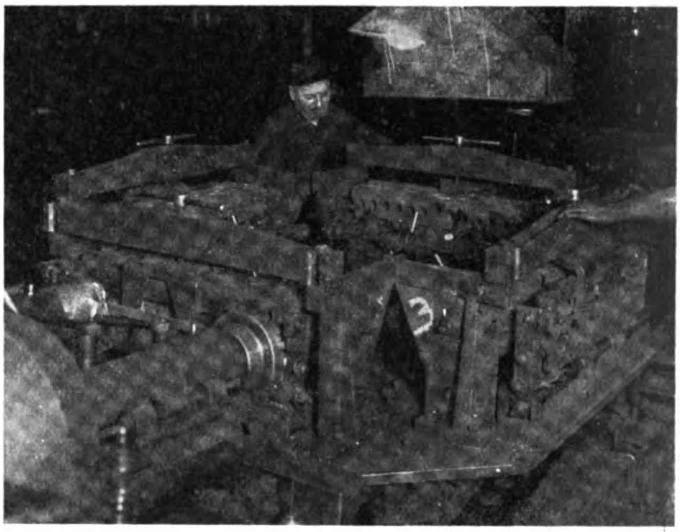
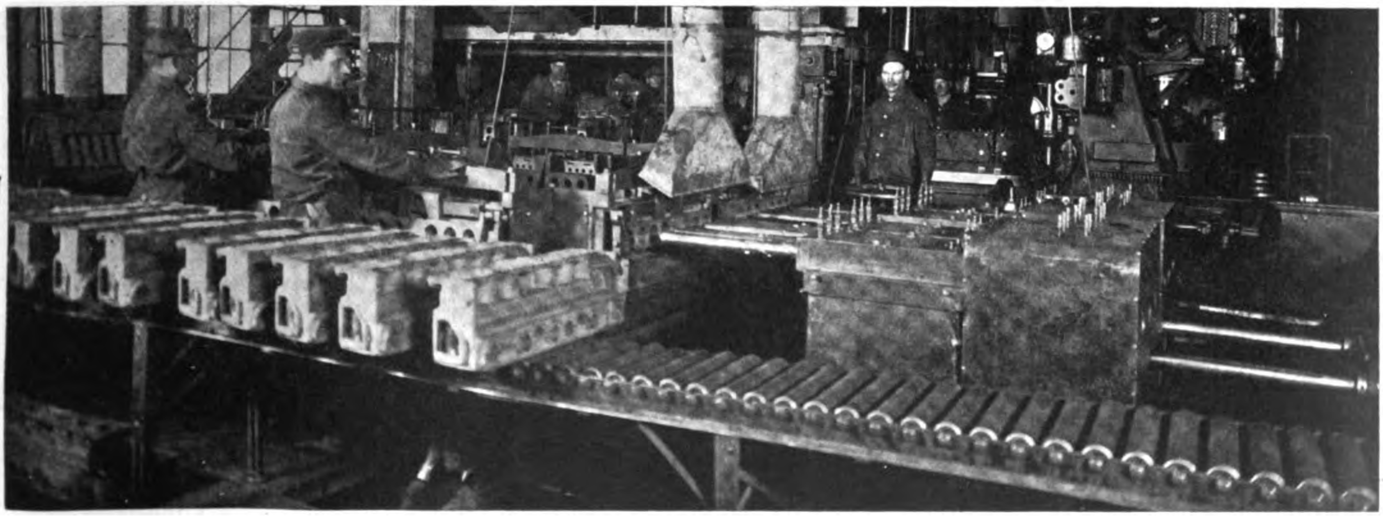


This machine is facing off at one time all the necessary surfaces, six of them, on a Packard front axle



Cylinder block milling machine which handles four cylinder blocks on a single table



A good example of how special machinery fits into the progressive system. The gravity conveyor brings these cylinder blocks to the boring machine and they are then sent on their way for further operation

Metric Conversion Tables

A Series of Tables of Equivalents Arranged for Quick and Easy Reference

THE fundamental unit of the metric system is the METER—the unit of length. From this the units of capacity (LITER) and of weight (GRAM) were derived. All other units are the decimal subdivisions or multiples of these. These three units are simply related, *e. g.*, for all practical purposes one CUBIC DECIMETER equals one LITER and one LITER of water weighs one KILOGRAM. The metric tables are formed by combining the words "METER," "GRAM," and "LITER" with the six numerical prefixes, as in the tables herewith.

All lengths, areas, and cubic measures in the following tables are derived from the international meter, the legal equivalent being 1 meter = 39.37 inches (law of July 28, 1866). In 1893 the United States Office of Standard Weights and Measures was authorized to derive the yard from the meter, using for the purpose the relation legalized in 1866, 1 yard equals $\frac{3600}{3937}$ meter. The customary weights are likewise referred to the kilogram (Executive order approved April 5, 1893). This action fixed the values, inasmuch as the reference standards are as perfect and unalterable as it is possible for human skill to make them.

Fundamental Equivalents

PREFIXES	MEANING			UNITS
milli-	= *one thousandth*	$\frac{1}{1000}$	.001	
centi-	= *one hundredth*	$\frac{1}{100}$	.01	"meter" *for length.*
deci-	= *one tenth*	$\frac{1}{10}$	.1	
Unit	= *one*		1	"gram" *for weight or mass.*
deka-	= *ten*	$\frac{10}{1}$	10	
hecto-	= *one hundred*	$\frac{100}{1}$	100	"liter" *for capacity.*
kilo-	= *one thousand*	$\frac{1000}{1}$	1000	

All capacities are based on the practical equivalent 1 cubic decimeter equals 1 liter. The decimeter is equal to 3.937 inches in accordance with the legal equivalent of the meter given previously. The gallon referred to in the tables is the United States gallon of 231 cubic inches. The bushel is the United States bushel of 2,150.42 cubic inches. These units must not be confused with the British units of the same name, which differ from those used in the United States. The British gallon is approximately 20 per cent larger, and the British bushel 3 per cent larger, than the corresponding units used in this country.

The customary weights derived from the international kilogram are based on the value 1 avoirdupois pound = 453.5924277 grams. This value is carried out farther than that given in the law, but is in accord with the latter as far as it is there given. The value of the troy pound is based upon the relation just mentioned and also the equivalent $\frac{5760}{7000}$ avoirdupois pound equals 1 troy pound.

In view of the increasing use of metric measures and weights, and the extension of international standards, these tables will be useful for constant reference.

Production of Crude at New High Level

Exports of All Mineral Oil Products Except Kerosene Show Steady Increase for 21 Years

THE production of crude oil is always dependent upon the relation between the decline in the territory already yielding and the opening of new wells, new sands or new oil fields. Eastern oil properties have been declining for some years, while the demand has grown very rapidly in the same period. Other territories have been opened up in the Mid-Continent region—Louisiana and California principally—which have taken up the slack and added the necessary increase so that the production shows a steady and increasing rise as the demand came upon the industry. In the main, prospectors and producers have been able to keep up the discovery of new sands and fields at a sufficient pace to meet the demand of the automotive and other industries.

Twice of late years the production declined or remained stationary for almost a year; once, before the Mid-Continent field was more than experimental territory and after the drop in Texas and Indiana production had become severe (1907), and once again when the Cushing field in the Mid-Continent area declined in a few months from 300,000 bbl. daily to 100,000 bbl. daily (1912).

Prices are governed almost entirely by the relation of supply to market, and these times will find a corresponding

Mineral Oil Exports for 21 Years

rise in prices followed by a considerable drop, due to the temporary effect upon the total production. There is no immediate probability of a large increase in production above demands in this country, as increase in prospecting will depend upon a decrease in the material and equipment necessary and the discovery of considerable areas of new sand or new fields of importance.

Mexico, which has the largest probable supply of oil under ground on proved territory, is not likely to attract the prospector or investor until conditions stabilize.

Lowering in prices is likely to come only from the reduced demands of European countries in peace requirements and the opening up of the European fields to full production, particularly the Russian. There is therefore no immediate prospect of such abundance of oil as would lead to any considerable price change in the immediate future.

The United States has produced 60 per cent of the total crude petroleum output from 1857 to 1917 and produced 67 per cent of the total output for the year of 1917. Russia was second in production, turning out 26 per cent during the years 1857-1917 and 13 per cent in the year 1917, showing a reduction in the 1917 production as compared with that production maintained previously—a decline probably due to the unsettled Russian conditions. Mexico, which is hailed as the bonanza of oil centers, stands third on the list, having produced only 3.18 per cent of all the crude petroleum from 1857 to 1917, although its production increased satisfactorily in 1917. This output was 11 per cent of the world output that year.

The total production of the world for 1857 to 1917 was 293,309,824,332 gal., or 6,983,457,246 bbl. of 42 gal. each. The production for 1917 was 21,027,345,612 gal., or 500,651,086 bbl. of 42 gal. each. During the 1857-1917 period the output of the United States was 178,611,048,126 gal. of crude petroleum, or 4,252,644,003 bbl. of 42 gal. each. Russia during the same period produced 75,968,486,714 gal., or 1,832,583,017 bbl. Rumania, which in 1857 was the only nation producing crude petroleum, shows a figure of 142,992,465 bbl. produced during the 1857-1917 period. But the Rumanian production to-day stands ninth in rank owing to the discoveries and developments of petroleum in the United States, Russia, Mexico, Dutch East Indies, India, Galicia, Japan and Formosa.

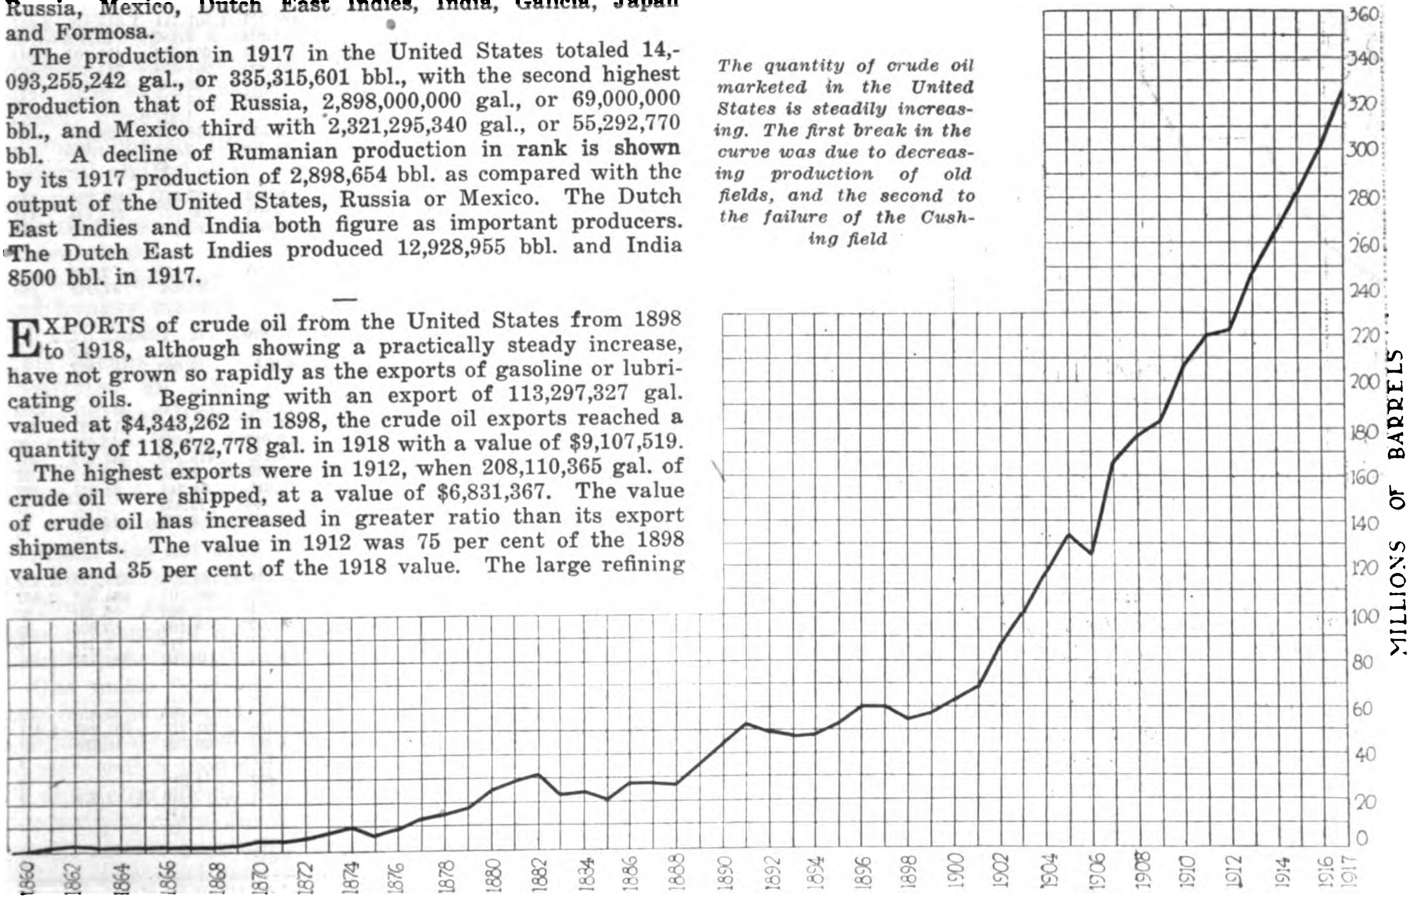
The production in 1917 in the United States totaled 14,093,255,242 gal., or 335,315,601 bbl., with the second highest production that of Russia, 2,898,000,000 gal., or 69,000,000 bbl., and Mexico third with 2,321,295,340 gal., or 55,292,770 bbl. A decline of Rumanian production in rank is shown by its 1917 production of 2,898,654 bbl. as compared with the output of the United States, Russia or Mexico. The Dutch East Indies and India both figure as important producers. The Dutch East Indies produced 12,928,955 bbl. and India 8500 bbl. in 1917.

EXPORTS of crude oil from the United States from 1898 to 1918, although showing a practically steady increase, have not grown so rapidly as the exports of gasoline or lubricating oils. Beginning with an export of 113,297,327 gal. valued at $4,343,262 in 1898, the crude oil exports reached a quantity of 118,672,778 gal. in 1918 with a value of $9,107,519.

The highest exports were in 1912, when 208,110,365 gal. of crude oil were shipped, at a value of $6,831,367. The value of crude oil has increased in greater ratio than its export shipments. The value in 1912 was 75 per cent of the 1898 value and 35 per cent of the 1918 value. The large refining activities carried on in the United States and the desire for refined oil productions rather than for crude oil have hitherto been the chief reasons for the comparatively smaller exports of crude oil.

Gasoline exports in the last 20 years grew from 16,252,927 gal., valued at $1,080,797 to 260,300,337 gal. valued at $61,447,382. The growth of gasoline exports has been a steady one with few declines, those being comparatively small. The greatest decline was in 1916 as compared with 1915. The 1915 exports totaled 156,000,000 gal. as compared with 100,000,000 gal. in 1916. The reason for this was that in the first year of the war the Allies ordered from us more gasoline than they consumed and a stock of this was carried over into 1916. At the same time the submarine warfare showed its effects in 1916. Exports of 1917 and 1918, 226,000,000 and 260,000,000 gal. respectively, will undoubtedly drop to some extent within the next year, as these were almost entirely for war consumption. Prior to the war the exports for the entire world totaled 81,698,917 gal. with a value of $10,831,490. The effect of the automobile on gasoline consumption is readily apparent in the export figures, which jumped from 16,000,000 gal. in 1898 to 77,000,000 gal. in 1910. The value of gasoline for export was 15 cents per gal. in 1898 and 23 cents per gal. in 1918. The 1917 value of 25½ cents per gal. for export was undoubtedly the highest price paid in the history of gasoline, which has been as low for export as 6½ cents a gal.

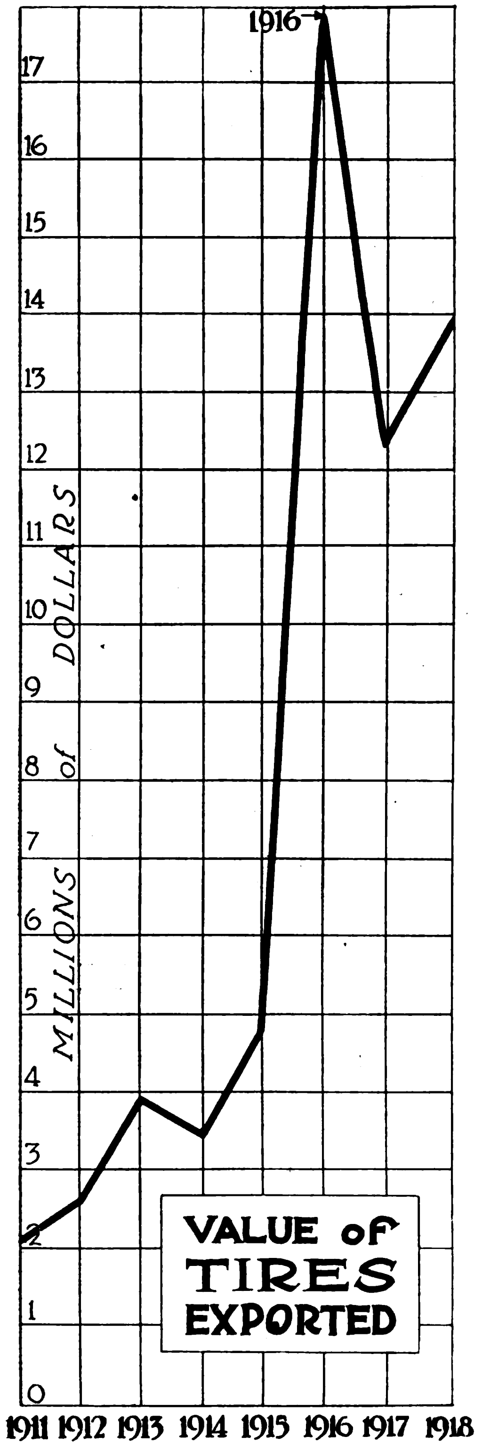
Illuminating oil exports, which include kerosene, have seldom varied between the figures of 800,000,000 gal. and 1,000,000,000 gal. during the past 20 years, this being due to a declining use of oil for illuminating purposes in many of the districts. The exports in 1898 of 824,426,581 gal. are approximately equal to the exports of 1915-1916 or 1917 and far in excess of the exports of 1918, which reached 528,805,501 gal. Prior to the beginning of the European war the exports had reached a high figure of 1,157,283,310 gal., the largest quantity exported in any single year. The value of illuminating oil for export has increased from 5 cents per gal. in 1898, when it was more expensive than gasoline, to 9 cents per gal. in 1918, the highest price paid for illuminating oil for export.



The quantity of crude oil marketed in the United States is steadily increasing. The first break in the curve was due to decreasing production of old fields, and the second to the failure of the Cushing field

Exports of Pneumatic Tires for Eight Years

(Prior to 1911 Tires were included in "All other manufactures of rubber")



There are two reasons why our exports of pneumatic tires should have dropped in 1917-1918. One is that the gasoline shortage abroad became more acute and the other that restrictions on the importation of crude rubber caused a reduction in production

1919 Engineering Trends

(*Continued from page* 97)

will be such. Development of the aluminum cylinder engine was unquestionably halted by the rise in price and scarcity of that metal, but during the war facilities for aluminum production have increased greatly, so there is every reason to expect a large drop in price.

Also the alloy steel situation is due to improve rapidly, and those factories which have been doing aviation engine work are now accustomed to handling delicate steels, so they will not be so afraid of employing them. There is a very substantial difference in the weights of a frame made of carbon steel and one of nickel chrome, for example; and axles can be lightened considerably by using high-grade materials.

Weight is likely to receive consideration because it is a factor of importance in the performing ability of a car. There is quite an effect on the accelerative ability if a few hundred pounds is cut away. Of course, the user gains most from light weight in the saving of tires and fuel, but the average buyer is more likely to be influenced by a good demonstration than by any forecast of running cost which the dealer may make.

Better Material and Workmanship Forecast

Another experience of the past four years is likely to encourage the use of good materials and a rather higher grade of workmanship, and this is a growing realization of the fact that a few dollars added to manufacturing cost may easily save several times that sum on the service department account. Some of the manufacturers of low and medium-priced cars who cut prices heavily in 1915, and trimmed the factory cost to match, have discovered that their economies were more apparent than real.

Every one knows that it is cheaper to make a good job in the first instance than to do a poor one and have to patch it up at a later date; but the point it is desired to make is that many manufacturers now know how far it is safe to cut manufacturing cost, because they have already gone the limit, and even a bit beyond it.

Conditions in 1917, under the shadow of war, with material and labor both scarce and dear, and with every prospect of further rises, made it very difficult for any manufacturer of any article not a prime war necessity to branch out in any direction.

To-day the conditions are reversed. There is a huge and hungry market, materials are falling fast, and will fall still faster, while labor cannot at least go any higher. This means that an engineer will not be afraid in specifying an alloy steel or aluminum part that the material may become too expensive or too scarce. He knows that if he can afford to use it now he will still better be able to do so in six months' time. Nothing is pleasanter than to plan a chassis and estimate its cost on a basis of prices which must *fall*. The automobile engineer has not been able to do this for so long that he has forgotten the feeling. Fall in material prices is not a thing to gamble on, however. It would be unwise to take a chance of a fall of any definite amount, but it is infinitely helpful to be protected against a rise.

One metal it is sincerely to be hoped will come into use once more, and that is copper and its alloys. On the moderate-priced car of the day there are many parts of steel which should not be made of that material. Brass or aluminum should be used always for all small fittings, for switch covers, for door handles, and for all the parts which receive constantly the friction of handling.

Iron and steel cannot be plated so that they will not rust, except at a high cost, and even then there is a limit to the durability of the plate. Brass or aluminum lasts forever, keeps its appearance and its efficiency; for the rusting of a switch cover, for example, not only mars the look of the whole car but eventually interferes with the working of the switch. Brass fittings were forced off the medium-priced car in 1915, and let it not be forgotten how infinitely better for their purpose they were than the gimcrack affairs too often employed to-day.

Among the large engineering problems to be faced, by far the most important remains the fuel question. It has been with us for 5 years, and it becomes worse rather than better. This, too, is a thing in which aviation engine work has been entirely unhelpful, because aviation engines have had good low-gravity gasoline provided for them; they could not have shown anything like the same results with the commercial fuel.

It is an easily demonstrable fact that a car which performs well on ordinary gasoline will outdo itself easily if filled up with the best aviation gas. Now, just as the crux of kerosene vaporizer design is that the most heat is required when there is least exhaust heat available, and vice versa, so does this hold true for gasoline carburation.

The hot-spot manifold, if it will operate successfully at low speeds and low throttle positions, cannot fail to give too much heat at full speed and full throttle. The wide-open position is so seldom used by the average driver that this does not matter much up to a point, but if fuel gets poorer it will begin to cause trouble.

It may be recalled that in the Nash car, introduced in the fall of 1917, an attempt was made partially to counteract the natural perversity of the case by using as part of the fuel heating system an exhaust jacket which was shut off as the throttle opened. This seems to be a step in the right direction.

There was a patent granted to R. W. A. Brewer some time ago covering the idea of heating a portion of the intake by bringing the exhaust manifold against it, but with the interposition of a block of copper or other good conductor between the two. Then by making the copper adjustable the area of contact could be varied. This is another way of approaching the same end, and no doubt there are still others.

Control of Cooling System

Closely interconnected is the control of cooling systems. The thermostat control of water circulation and the air shutter over the radiator appeared just about the time when it was very difficult to introduce anything new. One or the other of these systems, or some combination giving the same effect, is destined to become as universal as electric starting, for it is just as necessary, and 1919 will surely see the development take place.

It is distinctly interesting to observe that in the few foreign "after war" models which have been described in the British automobile journals no special precautions seem to have been taken to care for heavy fuel. The European engineer seems fondly to expect gasoline of a pre-war grade. That he will get it is exceedingly unlikely, so here is another feature in which American engineering is going to show the way.

Mentioning European automobiles in this connection leads to another fact which is not without interest to the American engineer, and this is that a big proportion of new European cars are sixes. While the high grade four seems likely to remain the pre-eminent type abroad for a while, there are so many sixes that no doubt can exist but that European engineers are going to try out the small six on their public, and there is little question that this is due to the success in Europe of the medium-priced American sixes imported in 1916 and 1915.

S. A. E. Standardization Work in 1918

Numerous New Standards Put on Record, Mainly Relating to Aeronautical, Motorcycle and Marine Work—Activities to Be Pushed the Coming Year

DURING the year 1918 more new standards were added to the S. A. E. lists than in any previous year. The majority of these were aircraft standards, but marine, motorcycle and tractor standards were also included in considerable number. Much of the work that led to the adoption of these standards was done during 1917, but action on it by the Standards Committee was taken only at the winter meeting of 1918. Most of the activities of the Standards Committee and its numerous divisions during the past year and a half have been influenced by war conditions. For instance, all of the work carried on in connection with aircraft and motorcycle engineering was done in response to a direct request from a Government department. In addition to the regular standards the Standards Committee also has worked out various recommended practices, especially in connection with aircraft work.

The ball bearing standards, although in force now for quite a number of years, were revised during 1918. A practically complete series of thrust bearing standards also has been on the Data Sheets of the Society for some time, but in 1918 standard tolerances for such bearings were adopted.

The Engine Division drew up a design for hand starting cranks which was accepted by the Society in the course of the year and is now a recognized standard.

Magneto dimensions had been standardized previously for 4 and 6-cylinder engines, but certain dimensions applying only to 8 and 12-cylinder engines were added in 1918, as were complete dimensions for motorcycle magnetos. There are now three sets of standard magneto dimensions, viz., for 4 and 6-cylinder magnetos, 8 and 12-cylinder magnetos and motorcycle magnetos.

Standard Bracket Mounting for Generators

A standard bracket mounting for electric generators was adopted in August, 1918, and supplements the previously standardized flange mounting. The ignition distributer mounting adopted in 1917 was revised and extended in 1918. The same applies to the standard flange mounting for starting motors. Several detail standards have also been evolved by the Electrical Equipment Division and incorporated among the regular standards of the Society during the year. These include cables and cable terminals for starting motors, starting motor pinion details and starting switch location.

Clamps and fittings for rubber hose as used in aeronautic work were adopted. The connections of thermostats have also been standardized, it being specified that these must conform either to the S. A. E. carbureter flange standard or the S. A. E. clamps and fittings standard for rubber hose.

The first aeronautic standards were put through in very much of a hurry, and it is little wonder that several had to be revised within a year, especially when the intense development in aircraft engineering is considered. This applies to loops and ferrules for round tinned steel wire, loops for single-strand non-flexible steel cable, plain hexagon head bolts, ball hexagon head bolts, castle hexagon nuts and ball hexagon nuts. A standard for plain hexagon nuts was adopted in 1918. All of these airplane parts are for use in wing and body construction only and not for use on aircraft engines.

A considerable amount of standardization work is now in progress and is awaiting action at the coming annual meeting of the Society.

The Electrical Equipment Division has decided to recommend the adoption of two types of cable terminals for ignition distributors, generators, meters and switches. One of these is the spade type, which can be used either straight or with the wire connections set at an angle of 90 deg. to the spade, for use in connection with binding posts having Nos. 8, 10 and 14 machine screw threads. The other type is a flat terminal with the wire coming in at the side, which fits the same sizes of screws. All terminals are to be 1/32 in. thick, to insure proper strength. Another recommendation to be made by the same division is in regard to a sleeve type of starting motor mountings. This mounting is to be used only in connection with an outboard screw shift pinion drive. In the design submitted, a cylindrical portion of the gearshift housing slides into a bored hole in the bell housing. The gear housing is locked in position in the bell housing by means of a set screw with a tapered point. Some attention has also been given to the subject of rating of storage batteries for farm lighting outfits. It is the consensus of opinion that this rating should be based upon an intermittent discharge test.

The engine division has recommended two sizes of rear supporting arms, one to be used with the No. 1 S. A. E. flywheel bell housing, and the other with Nos. 2, 3, 4 and 5. Standardization of the front swivel support is now under consideration. Another standard to be recommended concerns flexible disc magneto couplings. These are to have an outside diameter of disc of 2¾ in. and an inside diameter of 1 in., a diameter of bolt circle of 2 in., a thickness of disc of ¼ in. and four ¼-in. bolts equally spaced.

A sub-division of the Marine Division has evolved standards for swing port lights in five sizes, with air openings of 10, 12, 14, 16 and 18 in. diameter respectively.

The Miscellaneous Division has under consideration the subject of carbureter hot-air intake sizes, and it is hoped that a report may be made on it at the time of the annual meeting. The division is also revising the aeronautical spark plug shell standard, in order to bring it into harmony with a desired international standard.

The Springs Division, as usual, has been quite active again, and has recommended a number of new spring points, a test for parallelism of spring eye center lines, and revisions of various spring standards.

One of the new divisions of the committee, that of Stationary and Farm Engines, has made some recommendations regarding voltage and capacity ratings of farm lighting outfits. At the present time small generators are generally built to be operated at 1800 r.p.m., while engines of the capacity for farm lighting purposes only run at about 1000 r.p.m. The division considers that it would be of great advantage to purchasers and to the trade as well, if both engines and generators were designed to run at the same speed, so that the generators could be driven directly; and they have recommended that 32 volts be the standard voltage for farm lighting outfits, and recommended various speeds for engines and generators of different output. Flanges for cast iron carbureters and oval and round pipe flanges are other subjects that have received consideration.

The Tire and Rim Division of the committee has been very busy and has taken action on a considerable number of subjects. A table of solid tire sizes has been worked out, to conform to the present table of Class A Pneumatic tire sizes. This includes 15 sizes, ranging from 32 x 3½ to 40 x 14. Other subjects on which action has been taken by this division include base bands for solid tires, industrial truck tires, base bands for industrial truck wheels, allowable tolerances for felloe bands, wood-felloe dimensions for pneumatic tire rims, pneumatic tires for motorcycles, wood spokes for passenger car wheels, valve hole sizes for automobile rims, and solid tire sections and contours.

21 to 35	0.8268 to 1.3779	0.0025	0.0025

BALL BEARINGS

Temperature for Measurements

These tolerances are applicable only when the bearings and measuring appliances have been brought to a uniform temperature, as for instance 68 deg. Fahr. In case of question as to measurements, gages officially checked by the United States Bureau of Standards shall be considered as final. These tolerances are understood as referring to the dimensions of ball bearings, and not to the dimensions of measuring instruments. When it is desired to measure bearings by the use of maximum and minimum gages, the dimensions of the maximum gage shall be 0.0001 in. over the maximum bearing dimension, and the dimension of the minimum gage shall be 0.0001 in. under the minimum bearing dimension.

The above paragraph specifying the temperature at which tolerances are applicable to bearings and measuring appliances applies both to annular (radial) ball bearing tolerances and thrust bearing tolerances.

Definition of Eccentricity.

The eccentricity of the inner race is that lack of running truth noticed upon the stationary outer race when rotating the inner race and balls upon true centers.

The eccentricity of the outer race is that lack of running truth shown upon a suitable indicator during the rotation of the outer race and balls upon the inner race fixed upon a stationary arbor.

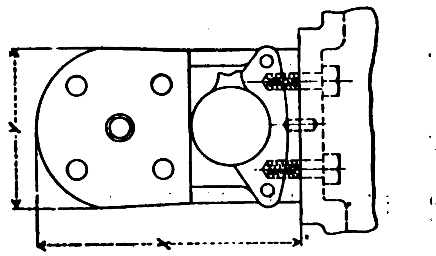
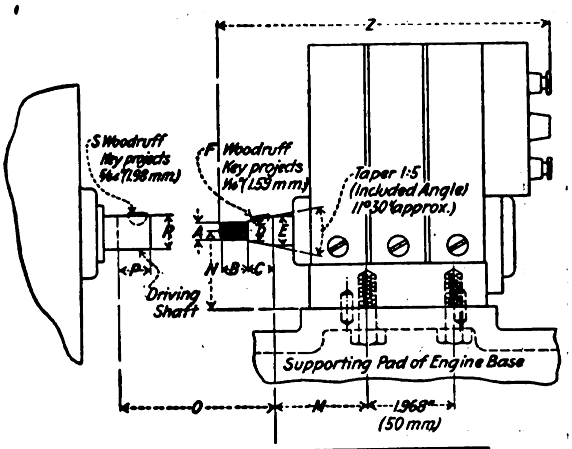
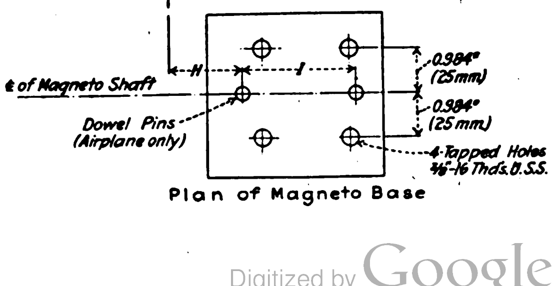
*Provides for Impulse Couplings for tractors. Conforms to National Gas Engine Association standard.

†Recommended material for drive-shaft is selected cold-rolled stock.

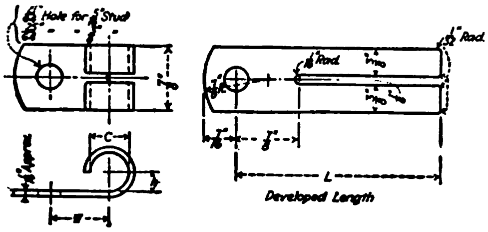
‡Not for use in airplanes.







Plan of Magneto Base



CABLE TERMINALS FOR STARTING MOTORS.

Terminal No.	C	h	W	L
1	17/32	17/64	13/16	2 3/16
0	13/32	19/64	27/32	2 5/16
00	21/32	21/64	⅞	2 ½

Dimensions in inches.

Materials

The materials recommended for cable terminals for starting motors are: Tinned copper, tinned brass, or zinc-coated steel.

CABLES FOR STARTING MOTORS

*Cable Size	Max. Cable Length, Ft.
SB-1	5
SB-0	7
SB-00	9

The three sizes of cables for starting motors given above are considered sufficient to cover all usual 6-volt requirements. The cable lengths specified are based on an allowable drop of 0.3 volt at 500 amperes.

*"SB" indicates Single Braid.

STARTING MOTOR PINION

Flywheel starting motors shall be equipped with an 8-10 pitch, 11-tooth, 20-deg. pressure angle pinion. The pitch line clearance between pinion and flywheel shall be 0.015 inch.

STARTING SWITCH LOCATION

Starting switches shall be located on the chassis so as to facilitate electrical assembly and testing on chassis.

IGNITION DISTRIBUTOR MOUNTING

The ignition distributor mounting dimensions shown are suitable for use when the distributor is mounted on either the generator or the engine.

BRACKET MOUNTING FOR GENERATORS

This specification is complete in regard to mounting dimensions of the generator. Bracket dimensions and the dimensions and location of the pad on the crankcase are now being determined.

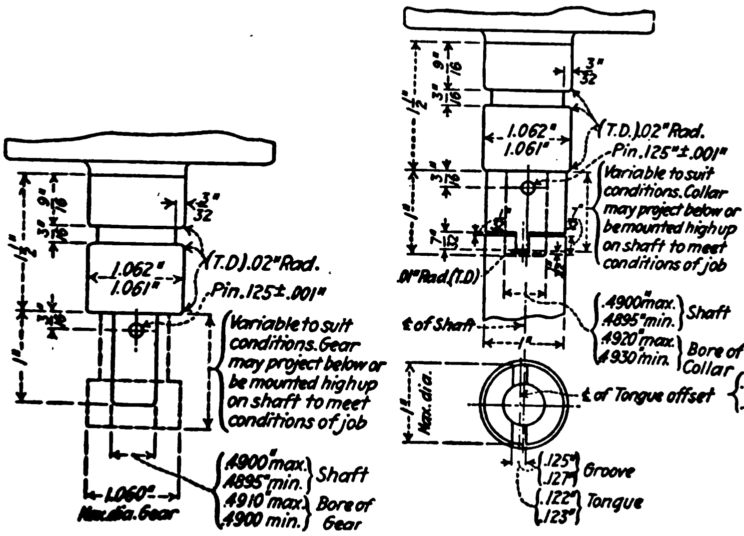
GENERATOR SHAFT-END FOR COUPLING DRIVE

The shaft-end illustrated under Bracket Mounting for Generators is considered of ample capacity for all sizes of generators, except in special instances where small generators, naturally not suited to this Standard, may be fitted with the standard magneto shaft-end in accordance with present practice.

FLANGE MOUNTINGS FOR STARTING MOTORS

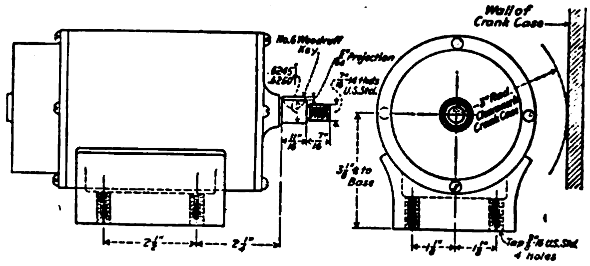
Size No.	A	B	C	D	E
1	2⅝	2⅛	13/32	9/16	3.496 to 3.499
2	2 11/16	2⅞	13/32	9/16	3.621 to 3.624
3	2 13/16	3⅛	15/32	19/32	3.621 to 3.624

These standard flanges may be used for either right-hand or left-hand mounting of motors.



Type A *Type B*

Ignition distributor mounting



Bracket mounting for generators

SPARK CONTROL—MOTORCYCLE

Spark control on military motorcycles shall be of the handle bar grip type placed on the left side and arranged to advance the spark by turning top of the grip toward the center.

THROTTLE CONTROL—MOTORCYCLE

Throttle control on military motorcycles shall be of the handle bar grip type, placed on the right side and operate to open the throttle by twisting the top of the grip toward the center.

KICK STARTERS—MOTORCYCLE

Kick starters on military motorcycles shall be of the folding pedal type and operate by pushing down and back.

Starters cannot be confined to a definite side until further standardization takes place on engines.

CLUTCH PEDAL—MOTORCYCLE

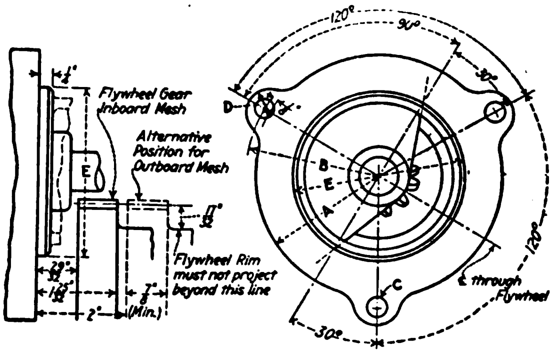
Clutch pedal on military motorcycles shall be placed on the left side and operate to release the clutch by pushing forward and down, clutching by reverse action.

BRAKE PEDAL—MOTORCYCLE

Brake pedal on military motorcycles shall be placed on the right side and operate to apply the brake by pushing down.

OIL AND GREASE CUPS—MOTORCYCLE.

Oil and grease cups on military motorcycles shall have an attaching diameter of 5/16 inch, 32 threads.



Flange mounting for starting motors

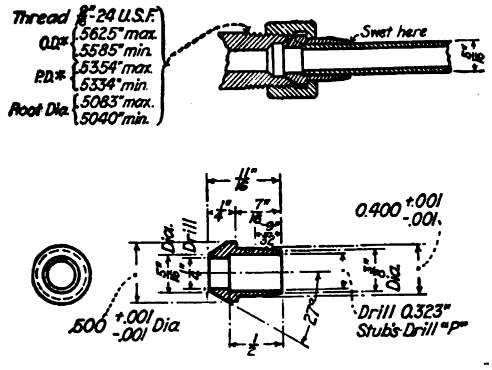
CLAMPS AND FITTINGS FOR RUBBER HOSE

Inside Hose Diameter	Outside Diameter of Hose and Extended Inside Diameter of Clamps: Single-ply	Two-ply	Three-ply	Four-ply	Length of Fitting for Lap of Hose
3/16	7/16	½	9/16	⅝	1
¼	½	9/16	⅝	11/16	1
5/16	9/16	⅝	11/16	¾	1
⅜	⅝	11/16	¾	13/16	1
½	¾	13/16	⅞	15/16	1
¾	1	1 1/16	1⅛	1 3/16	1
1	1¼	1 5/16	1⅜	1 7/16	1¼
1¼	1½	1 9/16	1⅝	1 11/16	1¼
1½	1¾	1 13/16	1⅞	1 15/16	1¼
1¾	2	2 1/16	2⅛	2 3/16	1¼
2	2¼	2 5/16	2⅜	2 7/16	1¼
2¼	2½	2 9/16	2⅝	2 11/16	1¼
2½	2¾	2 13/16	2⅞	2 15/16	1½
3	3¼	3 5/16	3⅜	3 7/16	1½

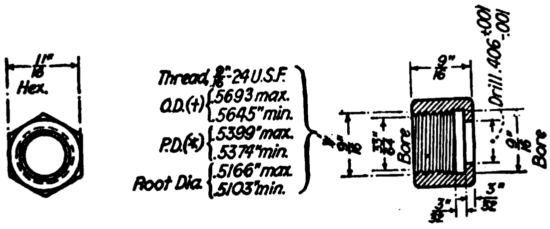
Limits on inside diameter of hose ± 1/64. Limits on thickness of hose (not measured at lap) ± 1/64. All dimensions in inches.

CLAMPS AND FITTINGS FOR RUBBER HOSE—AERONAUTIC

In order to comply with present practice and utilize existing hose connections, the list of sizes shown above are recommended for aeronautic practice.



Brass



Steel—copper and white nickel plate

*Actual size.
†Minimum diameter for respective pitch diameters. Outside diameter tolerances of commercial taps are slightly greater.

MOTORCYCLE FUEL AND LUBRICATION PIPE FITTINGS

Fuel and lubrication pipes on military motorcycles shall be 5/16 in. outside diameter and the fittings shall be of the soldered type with 9/16 in. nut, 24 threads, United States Form.

Outside diameter tolerances of commercial taps are slightly greater.

5032	5	5	3¼	3	5/32	5/32	10½	17 5/16	½	11⅜	13½	15½

Wood Spokes for Commercial Vehicle Wheels

The first two figures of the symbol number indicate the finished size of barrel (thickness between flanges); and the second two figures indicate the dry width of head. The first figure of each pair indicates whole inches, and the second indicates eights of an inch; thus 1425 indicates 1½-in. barrel and 2⅝-in. head.

Radial allowance above flange diameters

⅛ in., up to and including 9-in. flanges
3/16 in., from 9 in. to 11½-in. flanges, inclusive
¼ in., above 11½-in. flanges

TACHOMETER DRIVE

Instrument End—The upper or instrument end of the shaft has a squared socket, made integral with a shoulder which forms a thrust bearing.

Engine End—The lower or engine end is finished with a cylindrical end with a single integral key.

Casing—The casing is to be of flexible metallic tubing, covered with whipcord braid and impregnated to prevent oil leakage; similar to sample, or covered with other material which will be equally flexible, oil tight and free from stretching and of no greater weight than the whipcord braid covering casing. The outside diameter of casing to be over braid to be approximately 7/16 in.; the inside diameter of casing to be approximately ¼ in. The ends of the casing are finished alike, as shown in detailed sketches. The screw-threaded sockets covering the whipcord braid are screwed in place and set with shellac or other suitable material to form an oil-tight and permanent connection.

Shaft End—The shaft end at the engine is drilled and slotted to fit the tachometer shaft end, allowing for end-play of at least 1 in. More play than this may be required where the drive shaft is more than 6 ft. in length, the amount to be determined experimentally.

Drive Shaft—Drive shaft to be of helical wire wound construction, with core wires.

Spindle—The tachometer spindle is finished square to fit the square socket on the drive shaft.

Drive Shaft—Drive shaft will rotate at one-half crank shaft speed.

End Nuts—Size and contour of exterior circumference of end nuts optional, but 15/16 octagon recommended.

TRACTOR DRAWBAR RATING

The drawbar rating shall be 80 per cent of the horsepower that the tractor is guaranteed to develop at the drawbar continuously for two hours, the tractor being in good condition and properly operated at rated engine speed. The tests should be taken on ground sufficiently firm to give the traction wheels a good footing, a firm sod being preferable.

HEIGHT OF TRACTOR DRAWBAR

The standard height of drawbar shall be 17 in. for both plowing and other work.

PLOWING SPEED

The standard tractor speed for plowing shall be 2½ m.p.h. for tractors of 15 drawbar hp. and under.

MAGNETO DIMENSIONS

Magnetos for tractors shall be made to S. A. E. Standard dimensions as shown in S. A. E. Handbook, Vol. I, pages 36 and 36xa.

The magneto drive shaft on the engine shall be 0.750 in. diameter, the magneto coupling to be attached to this shaft by a key and pin.

TRACTOR BELT POWER RATING

The belt horsepower rating shall be 80 per cent of the horsepower the engine is guaranteed to deliver at the belt pulley continuously for two hours, the engine being in good condition and properly operated at rated speed.

TRACTOR BELT SPEED

A belt speed of 2600 ft. per min. at the crown of the pulley shall be used for all tractors, this being a speed which will meet the widest range of conditions.

TRACTOR BELT AND PULLEY WIDTHS

Belt pulleys for tractors shall be as large as possible, and the widths vary according to the horsepower delivered, as shown in the following table:

Horsepower	Pulley Widths, In.	Max. Belt Widths, In.
Under 20	6½	6
20 to 30 inc..........	7½	7
Above 30.............	To be determined	

It is intended that the maximum belt widths shall be ½ in. less than pulley widths

S. A. E. STEELS FOR TRACTORS

S. A. E. Steel No. 1020 is recommended for all ordinary hot and cold-rolled shafting, gear blanks and shapes; also for cold-rolled bars for general use.

S. A. E. Steel No. 1045 is recommended for all hot and cold-rolled special shafting where a hard surface is needed.

TRACTOR SCREWS AND BOLTS

In tractor engines, S. A. E. Standard screws for tapped holes shall be used, except in soft material such as cast-iron, brass, bronze or aluminum, where U. S. Standard screws shall be used.

In general tractor construction bolts and screws of the U. S. or S. A. E. Standard pitches, with square or hexagon heads, shall be used. They shall be limited to ⅛-in. steps above ½-in. diameter, and 1/16-in. steps below ½-in. down to and including ¼-in. diameter.

TRACTOR CARBURETER FLANGES

All oversize carbureters shall be equipped with the next size larger S. A E. Standard flange than the flange standardized for the nominal carbureter opening. (For example, on a 1⅝-in. oversize carbureter, the flange shall be the same as for the 1½-in. nominal.)

Engine coupling—steel

MARINE PROPELLER SHAFT COUPLINGS

ENGINE COUPLING—STEEL

The engine end when integral with the engine shaft is shown in full lines on the drawing. When separate, the shaft taper and dimensions are the same as for Reverse Couplings of the corresponding size.

The reverse gear end, as shown by full lines, shall have drilled bolt holes. When the flange is designed integral with the reverse gear, as shown by dotted lines, the bolt holes shall be drilled and tapped for S. A. E. standard cap screws.

These couplings are designed to be made of steel and are intended for high power engines.

NOTES RELATING TO TABLE BELOW

(T. D.) indicates Tooling Dimensions. Dimensions in inches.

NOTE.—In column "Size No." E indicates Engine, R indicates Reverse Gear, and the figures number of eighths of an inch in shaft diameters.

‡Pilot tolerance, + 0.000, — 0.001 in. per inch of diameter. Pilot recess tolerance, + 0.001, — 0.000 in. per inch of diameter.

§Figures in column indicate bolt diameters. Use clearance drill of same nominal size for holes B in flange.

Notes Regarding Materials

When propeller mounts are for use in salt water, bronze or other non-corrosive metal is recommended for all parts of the hub, shaft and fairwater assembly.

When bronze is used, a tensile strength of 60,000 lb. per sq. in. and an elongation of 28 per cent in 2 inches is recommended. The chemical composition of a bronze conformnig to these physical properties is as follows: Copper, 62 per cent; tin, 1 per cent; spelter, 37 per cent.

A bronze having similar physical characteristics is commonly known as "Tobin bronze."

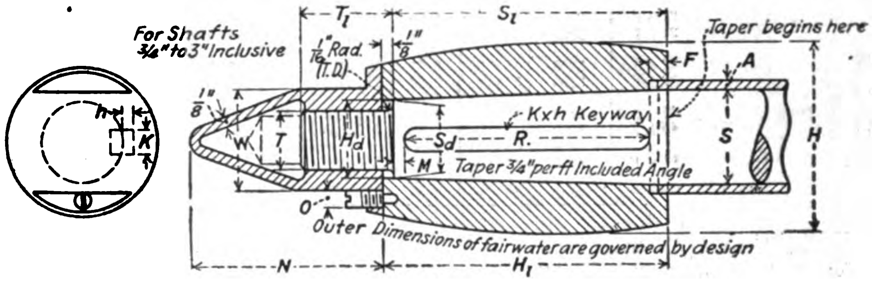
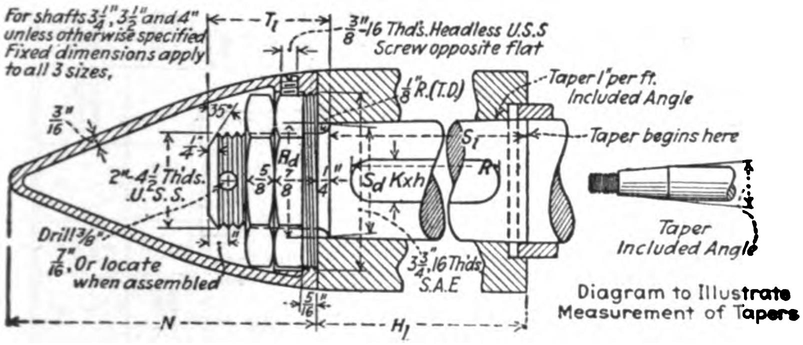
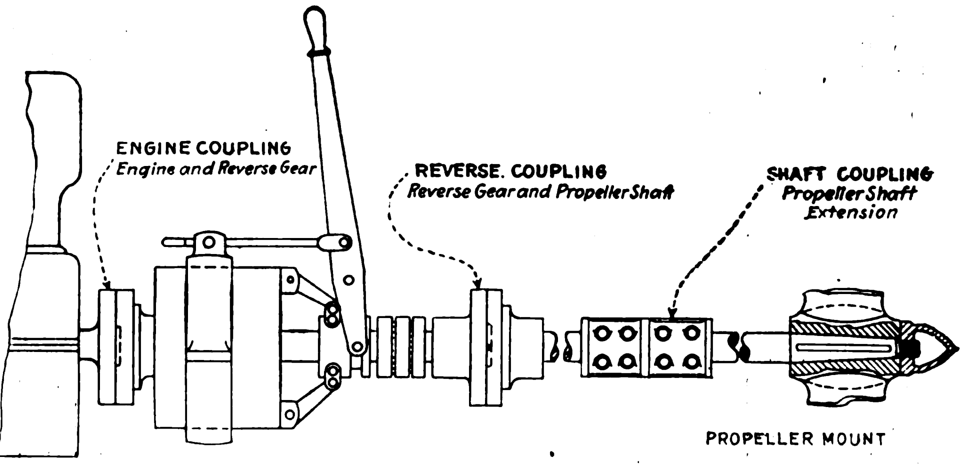
Shaft and Hub Taper Fits





The small end of the shaft and hub tapers (Sd and Hd in the drawings and table) are the governing dimensions which insure proper assembly of varying hub lengths on the shaft, and clearance between the end of the shaft taper and the bottom of the shaft nut.



MOTORBOAT TRANSMISSION ASSEMBLY

Drawing indicates the order in which the recommended couplings and propeller mount are assembled.

NOTES ON AERONAUTIC TURNBUCKLE DIMENSIONS

FACTORS CONTROLLING INTERCHANGEABILITY

The Recommended Practice for Turnbuckle Dimensions is not intended to limit design, but rather to aid manufacturers in designing, and so eliminate all differences that would otherwise interfere with interchangeability. The dimensions of the slot and the pin diameter in the fork end, and size of hole in the eye end, are the most important factors influencing interchangeability.

THREAD FITS, PROTECTIVE COATING AND INSPECTION METHOD

The fit of the threads in the barrel, the protective coating and method of inspection are to be specified by the purchaser. As a matter of information, the present practice for threads requires that they must have a snug, true fit, allowing barrel or shank to be turned by hand, and showing no perceptible slackness in fit or end-shake with three threads exposed.

TURNBUCKLE STRENGTHS

The turnbuckle strengths in the tables are for 19-strand steel wire cable (see S. A. E. Handbook, Vol. I, pages 45pc and 45pd). Breaking strength of spliced cable is about 10 per cent less than undisturbed cable. Yielding point of solid wire loops is about 20 per cent less than specified wire strength.

MEASUREMENT OF TAKE-UPS

Take-ups are measured with the threads of the turnbuckle ends flush with the ends of the barrel.

The amount of take up for each turnbuckle end is measured from the end of the barrel to a point on the radius f/2, on the detail drawings, which would strike the barrel threads. In some cases the take-up is limited to the distance from the inner end of the Eye, Fork or Clevis End to the near side of the spanner hole.

The total take-up is equal to twice that of the end having the least take-up.

KEY TO SYMBOLS.—The numbers indicate the turnbuckle strength in hundred pounds. The following letter, "Short" or "Long." The last letter indicates whether Fork (*F*) or Clevis (*C*) End is used in combination with Eye End. When the turnbuckle make-up calls for ends to be alike, one end shall have right hand, and the other end left hand, thread.

*Tolerance is + 0.0000 in., — 0.0060 in. †Tolerance is + 0.015 in., — 0.0000 in. Dimensions in inches.

NOTES.—1. Total take-ups for Eye End and Fork End assembly.
2. Will take 0.0180 in. serving. Use same size thimble as cable size.
3. Allows approximately 0.0150 in. on diameter below root diameter of thread.
4. Four clip thicknesses, 1/10, 1/8, 3/16, 1/4 in.

For further Notes on Aeronautic Turnbuckle Dimensions, see S. A. E. Handbook, Vol. I, page 45uj.

Dimensions of Aircraft Turnbuckles

KEY TO SYMBOLS IN THE TABLE ABOVE.—The numbers indicate the turnbuckle strength in hundred pounds. The following letter, "Short" or "Long." The last letter indicates whether Fork (*F*) or Clevis (*C*) End is used in combination with Eye End. When the turnbuckle make-up calls for ends to be alike, one end shall have right hand, and the other left hand, thread.

Dimensions in inches.
Ultimate strength, 125,000 lb. per sq. in.
*Tolerance is +0.0000 in.,—0.0060 in.
†Tolerance +0.0150 in.,—0.0000 in.

§To prevent off-centering of slot it is recommended that time thickness be governed by formula $W\ (min.) = \frac{F\ (min.) - G\ (max.)}{2}$

NOTES.—1. Allows approximately 0.0150 in. on diameter below root diameter of thread.
2. Four clip thicknesses, 1/16, 1/8, 3/16, 1/4.
3. Equals 2 E + 0.125 in.

All threads U. S. Form in the two tables below. Dimensions in inches. T. D. = Tooling Dimension.

*Finished size including plating or rust preventing treatment when used. Bureau of Standards recommends .00 in. as thickness of plating for rust prevention.

†It is recommended that production of the (No. 12) 28 bolts and nuts become effective at once, and not later than Jan. 1 1919.

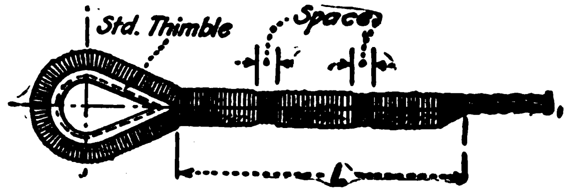
‡Subject to revision.

LOOPS FOR NON-FLEXIBLE SINGLE-STRAND STEEL CABLE—AERONAUTIC



The loop portion is served with 0.0180 in. soft steel tinned wire before thimble is inserted. The splice portion is served with 0.4010 in. soft steel tinned wire, divided into three equal sections as indicated in cut. The entire serving, including thimble and splice, must be soldered without drawing temper of wire.

Diameter of Cable, Inches	Number of Strands	No. of Wires per Strand	Splice L	Space	Length of Loop Serving	Breaking Strength of Cable, Lb.
1/16	1	19	1½	⅛	1	500
3/32	1	19	2	⅛	1¼	1100
⅛	1	19	2¼	⅛	1½	2100
5/32	1	19	2¾	⅛	2	3200
3/16	1	19	3	3/16	2¼	4600
7/32	1	19	3½	3/16	2¼	6100
¼	1	19	4	¼	2½	8000

LOOPS AND FERRULES FOR ROUND TINNED STEEL WIRE—AERONAUTIC

These recommended loops for round wires are made by threading the tension wire through a ferrule, forming a loop of the specified size, slipping ferrule up against loop and bending free end of tension wire over ferrule as shown. The ferrule is then thoroughly soldered in place without drawing the temper of the tension wire.

New Standard List of Pneumatic Tire Sizes

Together with a Collection of Recently Adopted S. A. E. Standards and Recommended Practices Relating to Tires and Rims

FOR years there has been a movement, fostered by the manufacturers of tires, to reduce the number of different sizes and types of tires called for by car manufacturers. The almost endless variety in which these tires were formerly manufactured made it almost impossible for dealers to keep a complete line in stock, and it was also a burden on manufacturers. Action was taken through the Standards Committee of the S. A. E., which formulated a list of standard sizes. A further impetus was given this movement last fall when the Commercial Economy Board of the Council of National Defense requested the War Service Committee of the American Rubber Industry to formulate a new reduced list of sizes and types of tires. It was then decided to discontinue at once the manufacture of tires of certain types and dimensions, to discontinue another list in November, 1918, another November, 1919, and a further one November, 1920. This will lead to the use, in the not distant future, of only seven regular sizes of automobile pneumatic tires and six over-sizes. It is recommended that manufacturers use as regular equipment of cars only the regular size tires and not over-size ones, as this gives the owner a chance to enlarge his tire equipment without changing rims. The sizes of tires given in the table headed Class A Sizes of Pneumatic Tires are to constitute the permanent list of standard sizes, while the manufacture of all other sizes is to be discontinued by November, 1920.

CLASS A—SIZES OF PNEUMATIC TIRES

(Permanent List)

Nominal Size	Average Tire	Rim Diameter	Type of Rim
30 x 3½	31 x 4	23	Clincher
32 x 3½	33 x 4	25	Straight side
33 x 4	34 x 4½	25	Straight side
34 x 4½	35 x 5	25	Straight side
36 x 6	38 x 7	24	Straight side
38 x 7	40 x 8	24	Straight side
40 x 8	......	24	Straight side

CLASS B—PNEUMATIC TIRE SIZES

(To be discontinued November, 1920)

Nominal Size	Type of Tread	Type of Rim
30 x 3	Plain and Non-skid	Clincher
32 x 4	Plain and Non-skid	Straight side
32 x 4½	Plain and Non-skid	Straight side
33 x 4½	Non-skid	Straight side
33 x 5	Non-skid	Straight side
34 x 4	Plain and Non-skid	Straight side
35 x 4½	Plain and Non-skid	Straight side
35 x 5	Non-skid	Q. D. clincher
37 x 5	Non-skid	Straight side

CLASS C—PNEUMATIC TIRE SIZES

(To be Discontinued November, 1919)

Nominal Size	Type of Tread	Type of Rim
33 x 4½	Plain	Straight side
35 x 4½	Non-skid	Q. D. clincher
36 x 4½	Non-skid	Straight-side
37 x 5	Non-skid	Q. D. clincher

CLASS D—PNEUMATIC TIRE SIZES

(Discontinued November, 1918)

Nominal Size	Type of Tread	Type of Rim
29 x 4½	Non-skid	Straight side
30 x 3½	Non-skid	Straight side
32 x 3½	Non-skid	Clincher
32 x 3½	Non-skid	Q. D. clincher
32 x 4½	Non-skid	Q. D. clincher
33 x 4	Non-skid	Clincher
33 x 4	Non-skid	Q. D. clincher
33 x 4½	Non-skid	Q. D. clincher
33 x 5	Plain	Straight side
34 x 4½	Non-skid	Q. D. clincher
35 x 4	Non-skid	Straight side
36 x 4½	Plain	Straight side
36 x 4½	Non-skid	Q. D. clincher
37 x 4½	Non-skid	Straight side

CARRYING CAPACITIES AND INFLATION PRESSURES

Tire Width, In.	Max. Load, Lb. per Tire	Inflation Pressure, Lb. per Sq. In.
3	375	45
3½	570	55
4	815	65
4½	1,100	75
5	1,300	80
5½	1,700	85
6	2,000	90
7	2,700	100
8	3,650	110
Motorcycle Tires		
2¼	175	35
3	325	40
3½	400	45

Detachable and Plain Clincher Rims

Valve holes in wood felloe for detachable and plain clincher rims to be same diameter as valve hole in steel rim.

VALVE-HOLE SIZE, AUTOMOBILE RIMS

The valve hole in automobile rims for S. A. E. standard tire sizes shall be ⅝ in. diameter up to 4½-in. rims, inclusive. Valve-hole sizes for 6, 7 and 8-in. rims are yet to be determined.

DEFLECTION AND SET TEST FOR AUTOMOBILE PNEUMATIC TIRE RIMS

The S. A. E. Standard Deflection and Set Test of rims is a pressure test with predetermined deflection under predetermined pressure. The test is made with water pressure.

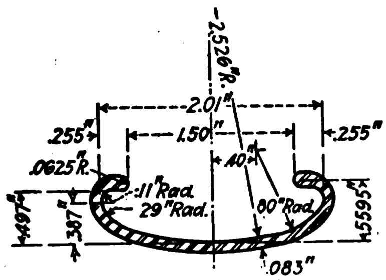
The measurements of deflection for either a clincher or a straight-side rim should be made across the extreme width.

Deflection should be measured from a fixed inflation load of 25 lb. per sq. in. for 3½, 4 and 4½-in. sections, and 50 lb. per sq. in. for 6-in. sizes and larger, up to a predetermined maximum, as follows:

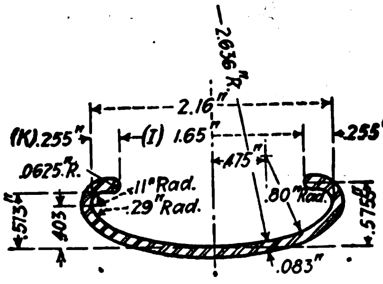
Rim Size Nominal, Inches	Pressure, Pounds	Maximum Deflection, Inches	Total Permanent Set, Inches
3½	140	0.06	0.02
4	160	0.07	0.03
4½	180	0.10	0.06
6	200	0.15	0.06
7	200	0.15	0.06
8		Yet to be determined	

In conducting the tests, measurements of deflection should be made after load increments of 25 or 50 lb. as above are added; at a corresponding set the load should be released.

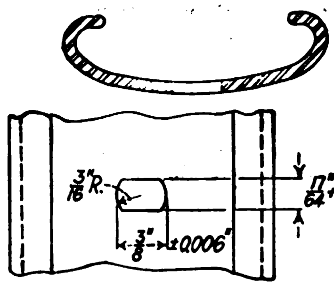
Motorcycle Rim Sections



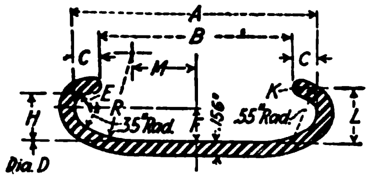
2¼ and 2½-in. B B rim section



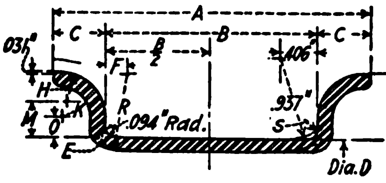
2¾ and 3-in. C C rim section



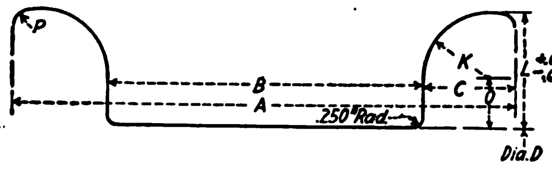
Valve hole for motorcycle rims



Clincher rim, No. 1



Straight side rim, No. 2



Straight side rim, No. 3

WOOD FELLOE DIMENSIONS FOR PNEUMATIC TIRE RIMS

Wood Felloe Dimensions

Nominal Tire and Rim Size	†Width (A)	†Depth (B)
30 x 3½	....	....
32 x 3½	....	....
33 x 4	....	....
34 x 4½	....	....
36 x 6	3¼	1⅝ ± 1/16
38 x 7	3 29/32	1⅝ ± 1/16
40 x 8	4¼	1⅝ ± 1/16

Dimensions in inches.
†Dimensions not given are to be determined.
NOTE.—The above values correspond to those adopted by the Automotive Wood Wheel Mfrs. Assn.

Bolt Equipment for Side Flanges of Solid Tires*

Nominal Outside Tire Diameter, In.	Diameter Bolt Hole Circle, In.	Number of Bolts
30	22½	6, 9, or 18
32	24½	8, 12, or 24
34	26½	8, 12, or 24
36	28½	8, 12, or 24
38	30½	10, 15, or 30
40	32½	10, 15, or 30
42	34½	10, 15, or 30

*All bolts to be ½ in. (12.7 mm.) diameter.

Edges of Felloe Band

Bands to be rounded on two outside edges with radius not to exceed 1/16 in. and on both inside edges with a radius of 3/16 in.
In measuring the circumference of the band, if there is not an allowance on the tapeline itself, a correction amounting to three times the thickness of the tapeline should be made.
All of the foregoing, so far as pertinent, applies to metal wheels.

INDUSTRIAL TRUCK TIRES

The S. A. E. standard nominal tire diameters for industrial trucks are 10, 16, 20, 22 and 27 in. Industrial truck tire sections recommended by the Association of Railway Electrical Engineers (given for reference only) are as follows:

Wheel Dimensions: Nominal Diameter with Tire	Diameter of Rim* without Tire	Tire Equipment, 4000-Lb. Truck
10	6.250	3 (Dual)
16	12.125	3½ (Single)
20	16.000	3½ (Single)
22	17.750	3½ (Single)
27	23.500	3½ (Single)

*Permissible tolerance from rim diameters: Minus, 000; Plus, 0.005.
All dimensions in inches. The standard of the Association of Railway Electrical Engineers further specify that all tire equipment is to be of the pressed-on type; the depth of tire section including base shall not exceed 2 in.; and the width of wheel rim shall not be less than width of tire seat. This refers to nominal width of seat, which is 6 in. for the 10 in. tire and 3½ in. for the 20, 22 and 27 in. tires.

SECTION DIMENSIONS OF SINGLE AND DUAL WHEELS

Single Wheels

Nominal Tire Widths, In.	Width of Felloe and Band, In.	Thickness of Steel Band, In.	Minimum Felloe Thickness, In.
2	1¼	¼	1¼
2½	1¾	¼	1¼
3	2¼	¼	1½
3½	2¾	¼	1½
4	3¼	¼	1¾
4½	3¾	⅜	1¾
5	4¼	⅜	2
5½	4¾	⅜	2
6	5¼	⅜	2
6½	*	⅜	2½

Dual Wheels

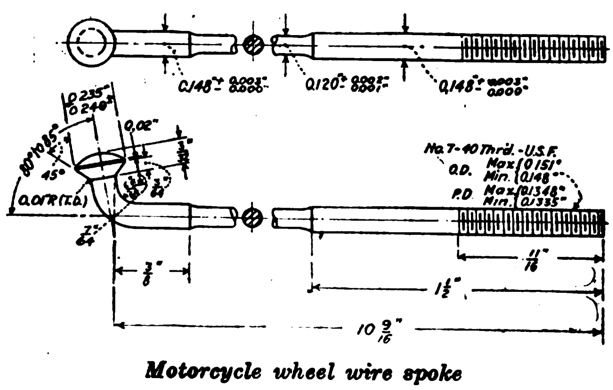
Width of band..................	1/32	1/32
Thickness of band	0.006	0.006
Radius of band after application..................	1/16	1/16

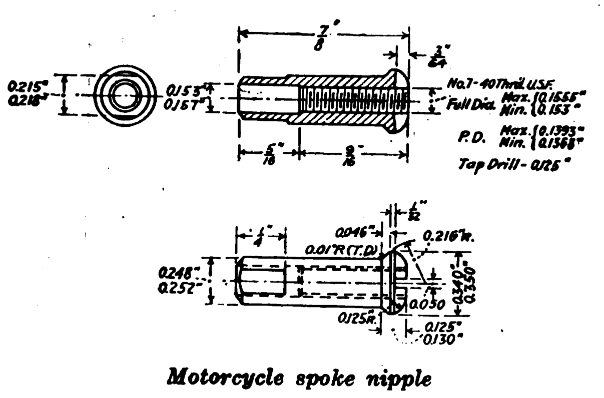
Circumferential deviation must be uniform over entire width of band. Radial deviations must not occur at diametrically opposite points, and there must be no flat spots or kinks in band and finished wheel. Either side of band when laid on a surface plate must not clear more than 1/32 in. at any point.

STANDARDS DIAMETERS OF SOLID TIRES

S. A. E. standard nominal tire diameters are 34, 36 and 40 in.



Motorcycle wheel wire spoke



Motorcycle spoke nipple

MOTORCYCLE SPOKE AND NIPPLE SPECIFICATION

Threads may be either cut or rolled but the unthreaded portion of butt must remain .148 inch + .033, —.000.

The nipple is to be made from free-cutting steel screw stock and is to be finished according to dimensions.

Spoke Wire Specifications

The spoke wire shall have the following chemical content within the limits specified:

Carbon	.40 to .55
Manganese, not under........	.50
Phosphorus, not over..........	.05
Sulphur, not over..............	.05

Tolerance of Diameter

The nominal wire diameter must be .148 inch + .000 — .001.

Bend Test

The wire must be held firmly in a pair of jaws so that it may be bent over a surface having a radius of one-half the nominal diameter of the wire, and shall stand a test of at least four bends, counted as follows: Holding the free length of the wire loosely between clamps so that it cannot bend except at the holding jaws, it is to be bent 90 deg. over one jaw; this to be counted as one bend. It is then to be bent up to its original position; this to be counted as the second bend. It is then to be bent 90 deg. to the other side (3rd bend) and back to its original position to complete the test.

Tensile Strength

The tensile strength of the wire is to be not less than 140,000 pounds per square inch.

Physical Test—Complete Spoke and Nipple

Tensile Strength

The finished spoke, when held at the bent end in the same manner as by the hub flange in a finished wheel and at the threaded end by a standard nipple with the spoke threads filling all the nipple threads, must sustain a dead load of not less than 1580 pounds.

Torsion Test

This test is not required.

MOTORCYCLE WHEEL AND RIM SPECIFICATION

(Motorcycle, Side and Rear Car Wheels)

	A	B	D	L	I	K
Nominal	6°	7° 30′	2.86	2.92	1.65	.255

Tractor Production Past and Present

Output Doubled During Each of the Last Two Years—Two and Three Plow Tractors Form Bulk of Production—Government Figures of Production, Domestic Sales and Exports

EVERYBODY knows that the production of farm tractors has increased by leaps and bounds during the past few years, but actual figures of production have been impossible to obtain until recently. Farm tractors do not have to be registered with the authorities like automobiles, and the only source of information regarding production is the manufacturers. But obtaining reliable figures from the makers themselves is not as easy a matter as might appear, especially when the attempt is being made by a publication, which immediately gives the manufacturer the impression that the figures are to be published broadcast and may be used by his competitor to his own injury.

But in order to judge properly the growth of the tractor industry, and the capacity of the market for absorbing tractors, it is highly important that such figures should be made available. We do not mean the production figures of individual manufacturers but those of the industry as a whole.

Fortunately the United States Government, when it became necessary to decide how much steel should be allowed the tractor industry, took it upon itself to gather statistics regarding production, domestic sales and exports during the years 1916, 1917 and the first half of 1918. The investigation was made pursuant to the President's Proclamation of May 14, 1918, relating to the farm equipment industry, which was issued under the authority of the Food Control Act.

Number of Tractors Manufactured

1916	29,670
1917	62,742
Jan. 1 to June 30, 1918	58,543
Total for 1916, 1917 and first half of 1918	150,955

Number of Tractors Sold

To Users

1916	27,819
1917	49,504

To Exporters

1917	14,854
1918, first 6 months	15,610
Number of tractors on hand, in transit, or in hands of dealers at time of report (August, 1918)	11,388

It will be seen from the figures published in tabular form herewith that the production of farm tractors increased more than 100 per cent in 1917 as compared with 1916—111 per cent to be accurate—and during the first half of 1918 the production was almost equal to that of the whole of 1917.

What the production was during the last half of 1918 can only be conjectured. If no obstacles had been encountered it would have seen a further substantial growth, but practically all of the factories met with great difficulty in securing materials. In fact, from Oct. 1 on, manufacturers were restricted to 75 per cent of the output of the previous year, which regulation was, however, withdrawn toward the end of the year. Aside from this official direct curtailment of production, there was an indirect curtailment, in some cases much more drastic than the direct one, which was due to the monopolization of forge and foundry output by munitions plants. Tractor manufacturers had a comparatively high priority rating among the industries, but, as one manufacturer put it, what is the good of a B-1 rating when all the foundries are loaded up with Class A stuff?

Taking the natural tendency toward expansion and the increasing demand for tractors among farmers, together with these restrictions on output, it seems reasonable to assume that the tractor output during the last half of 1918 was about the same as during the first half, and that the total production of the year was in the neighborhood of 125,000.

The 15-16 and 18-20 hp. ranges may be considered to cover the two-plow tractor, and the 20-26 hp. range the three-plow tractor. These are the sizes produced in the greatest numbers. Undoubtedly a much greater number of manufacturers are represented in the 22-26 hp. than in the 18-20 hp. class.

The curve of farm tractor production thus shows a rapidly rising tendency. In fact, the figures for the past three years form substantially a geometrical series. But what of the future? If this rate of progression is to be continued it will be only a few years till the tractor industry has attained a status commensurate with that of the automobile industry. There are several factors which will tend to maintain the rate of progress. One of these is the continued scarcity of food throughout the world, which will tend to maintain the prices of farm products and encourage farmers to make investments in equipment enabling them to increase their production. On the other hand, we must consider the fact that the phenomenal growth in the sales of tractors has riveted the attention of industrialists upon this industry and that many of the firms which until recently were engaged on Government war work and have been left with well equipped plants but without manufacturing lines, will seek their salvation in this new industry.

Of course, not all the currents of the changing times will favor the tractor. Farm help will not be as scarce this coming year, when most of our army is demobilized, as it was last year. There will also be more competition again in the markets of Europe from the more distant grain exporting countries such as Argentina and Australia. It is not believed, however, that these latter factors will seriously retard the forward march of the agricultural tractor industry. The main thing is that leading farmers have been convinced of the practical utility of the gas tractor.

Engineering improvement has been rapid during the past two years and will continue at an increasing rate. Next year's tractor will be more economical, more durable, handier and more comfortable than last year's. Engineers have made the tractor a practical farm implement and we may now safely leave it to the sales managers to find increasing markets for this new product of the automotive industries.

To the student of the tractor development the following figures, representing the number of tractors of different horsepower ratings turned out during the first half of 1918, will be of interest: 10-12 hp., 2714; 15-16 hp., 3716; 18-20 hp., 24,128; 22-26 hp., 20,658; 27 hp., 400; 28-30 hp., 2772; 35-36 hp., 1495; 40-50 hp., 1025; 60-80 hp., 1049. These figures seem to indicate that the future belongs to the two and three-plow tractor.

40 Years of Domestic Metal Production

Steady Increases Are Shown Throughout the Years and There Is Evidence of the Strenuous Effort Made to Increase Production to Meet the Demands of War

UNDER normal commercial conditions the state of the metal market has, quite naturally, interested the manufacturer of automotive products both in a general way and also more particularly in regard to those metals which are essentials to the carrying on of his business. In past years the various branches of our industry have been dependent on the prices set for steel, aluminum, copper and other metals for the fixing of their respective selling prices for the product with which they have been individually identified, or, at least, the basic prices of these metals exercised an influence on those of the complete car, truck, tractor, etc.

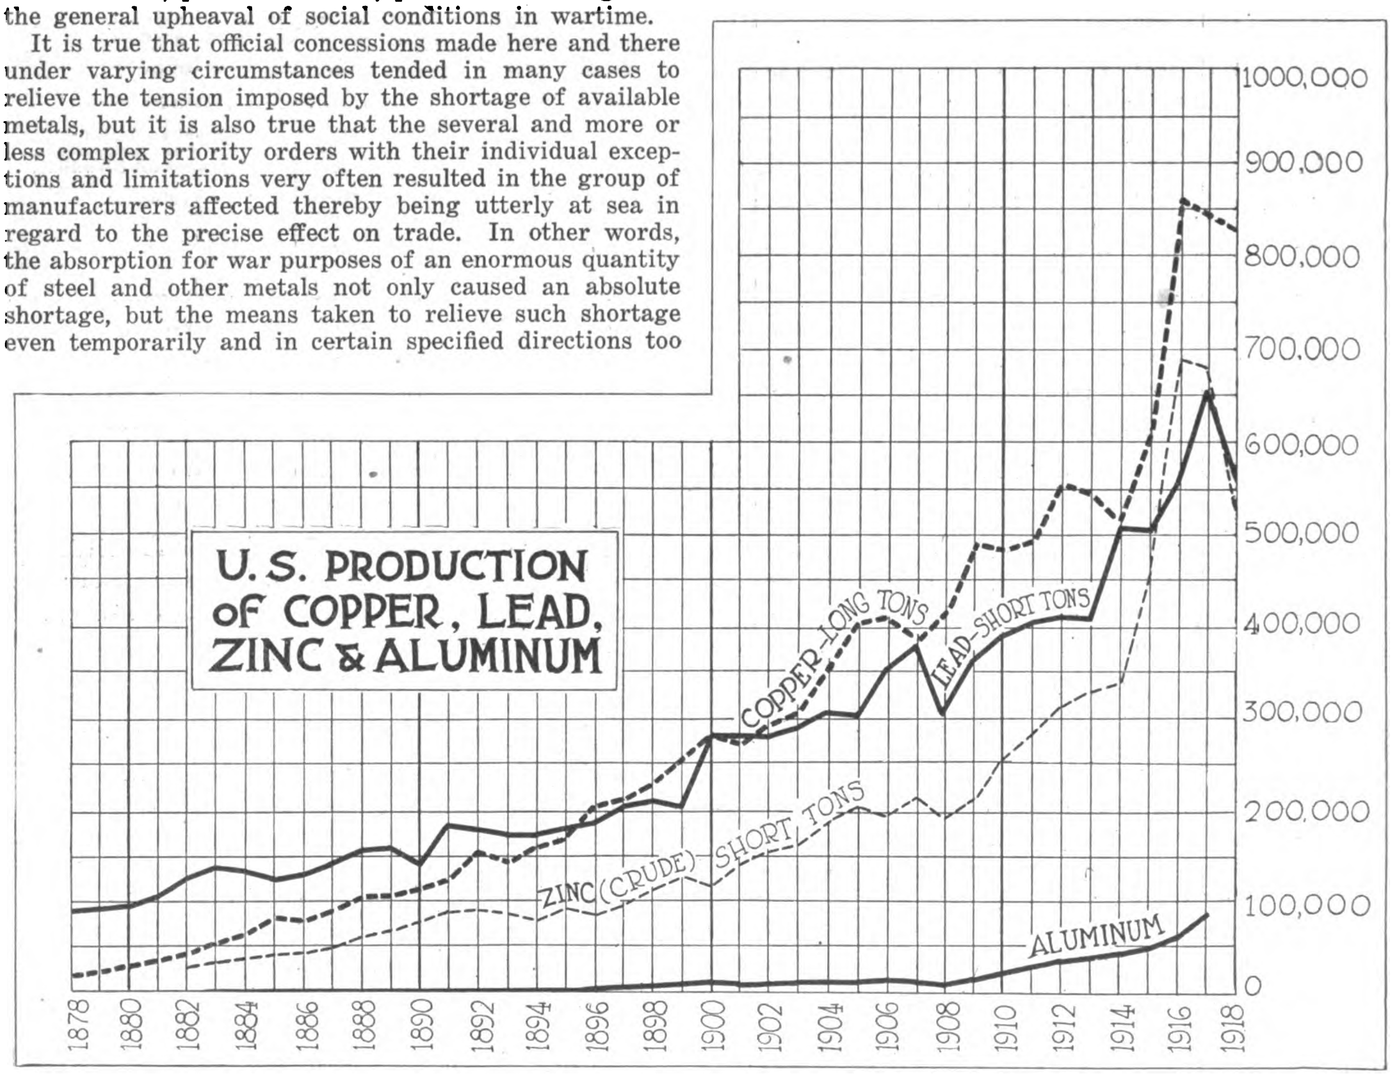
That conditions were abnormal in the highest degree during the past year is an axiom—the truth of the statement is so apparent that no proof or demonstration is needed—and obviously the automotive industry has been practically dominated by the existing position of the metal market, plus restrictions, plus labor shortage and the general upheaval of social conditions in wartime.

It is true that official concessions made here and there under varying circumstances tended in many cases to relieve the tension imposed by the shortage of available metals, but it is also true that the several and more or less complex priority orders with their individual exceptions and limitations very often resulted in the group of manufacturers affected thereby being utterly at sea in regard to the precise effect on trade. In other words, the absorption for war purposes of an enormous quantity of steel and other metals not only caused an absolute shortage, but the means taken to relieve such shortage even temporarily and in certain specified directions too often caused additional troubles and misunderstandings.

That this should be the case is not to be wondered at, for human nature has not changed since Æsop demonstrated it was impossible to please everybody, and, with the best possible intentions, the official allocation of certain metals to specified sections of various industries sometimes brought results which were not pleasing to others.

However, restrictions have been removed, production generally is speeding up, and already there are indications that things will be a bit easier for the automotive products manufacturer in the near future.

We are still faced with problems regarding steel, primarily, and other metals to a lesser degree, but, doubtless, these will be solved speedily. For instance, it is possible that several million tons of steel will be needed to assist in the restoration of devastated France and



Belgium. It is not known how much may be required, but it will be a quantity large enough to make serious demands on our present estimated production of 45,000,000 tons a year.

The table and charts herewith are self-explanatory, but in regard to them it should be mentioned that the pressure of wartime business has seriously interfered with the official compilation of production figures for 1917 and 1918. For this reason a few of the items are represented by estimated totals. All figures refer to domestic production only.

The tremendous growth in the use of the comparatively new metal, aluminum, is shown in the table. In 1883 the production was but 83 lb., in 1917 it was 180,000,000 lb., and, although figures for 1918 have not yet been compiled, there is but little doubt that the total is even larger.

Forty Years' U. S. Metal Production

	Aluminum (lbs.)	Copper (L. tons)	Lead (S. tons)	Pig Iron (L. tons)	Steel (L. tons)	Zinc (Crude) (S. tons)

Small Tractor Increases Potential Market From 2% to 60% of Farms

Development of Compact, Easily Managed Machines Extends Field From 15 to 48 States—Market Greater Than Production Capacity

THE last 2 years have seen an entire change in the condition confronting the farm tractor industry. Up to 1916 the number of farm tractors in use represented approximately one-third of 1 per cent of the total number of farms in the United States, and farm tractor use was confined to the great wheat and corn belt. In many of the eastern states very few farm tractors had been sold and the horse-drawn implements were used on practically all farms.

At the close of 1917 the number of tractors in use has increased to a little over one-half of 1 per cent of the number of farms and at the close of 1918 the number had increased to something over 1 per cent.

The increase in the tractor use had come almost entirely from the advent of the small compact tractor which extended the scope of the tractor into the smaller farms and extended its market into practically all states.

Up to a few years ago tractors were practically confined in their use to farms of 500 acres or over, and even in these farms a very small percentage of the farmers were using tractors at all. From the wheat and corn belt and the large farm interested in the extensive cultivation of subserials the developments in tractor design and production has carried the tractor at least to some extent into most of the other states and into farms of a general character down to as low as 50 acres.

It has made extensive markets in the states which previously had no use for tractors at all. It has not only extended the possibilities of the use of the tractor over small areas for cultivation but has made available for belt work in connection with the other power machinery possibilities on the smaller farms so that its economic value is increased and it can earn its way on farms restricted in size and devoted to general crops where the tractor of 3 or 4 years ago could not be economically used.

In New York State, which was not considered as a tractor market before this newer development, there has been a large sale of tractors in the last 2 years, and particularly in the last year, and they have been successfully used on farms as small as 50 acres. Some of the dealers in this state have sold as high as sixty tractor in their section.

The two conditions which have governed the development of the tractor in this way have been the world-wide demand for American food products, developed by the war, and a shortage of labor on the farm.

This shortage of labor is just as acute on the small farm as it is on the large farms in the wheat and corn belts, in fact in some respects it is more acute because of the difficulty in securing help of the character which must be available for the many duties devolving on the man on the smaller farm where jobs cannot be specialized.

In addition to this the farmer who is operating the smaller farm meets with the growing dislike of the laborer with the heavy physical work which is necessary in cultivating with horse-drawn implements, and in operating the hand machinery required in the other jobs.

The advent of the small tractor has automatically increased the potential market from approximately 2 per cent of the farms in the United States to a little over 60 per cent of the farms in the United States and it has automatically extended the market from approximately fifteen states to the forty-eight states of the Union.

It is evident that the demand for American food products is to continue with almost the same imperative necessity for some time to come although actual hostilities have ceased, because a large part of the European farm areas will still require a great deal of re-construction in order to put them back to a pre-war production.

It is also apparent that the labor shortage is to continue although perhaps not to the same degree. There is no evidence of any surplus of labor in the United States and when the readjustment is over there will still be a shortage which is usually felt on the farms more than in any other direction.

Under these conditions it is obvious that the actual immediate market for farm tractors is much larger than the present productive capacity and the potential market is at least as big as the developed market for passenger cars which has come out of the 20 years work in this field.

The development of the small tractor with its extended possibilities of service, less expensive to buy and maintain, with greater opportunities to become economically useful under the varied conditions of farming in this country, have increased the market not only by extending it over states which were not tractor users previously, but by increasing the possibilities enormously even in the states which previously used a good many of the tractors then produced. In Nebraska for instance a number of farms of 500 acres and over represents 11 per cent of the total while the number of farms of 100 to 500 acres represents 70 per cent of the total.

HORSELESS AGE SUBSCRIBERS
Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Car Registrations

THE most remarkable fact that may be gathered from the tables of car registrations, printed elsewhere in this issue, is that the greatest "density of automobiles" on the basis of population is to be found in the Middle-Western farming states. Iowa and Nebraska lead, closely followed by South Dakota —all adjacent states. In Iowa and Nebraska there is now one car to every seven of the population. It would not be quite correct to say that every second family there has its car, as in these states the people do not live in apartment houses and the families average larger than those of the big cities. In the cities of these states there must be many families which for one reason or another do not own a car, and the figures indicate that practically every farmer there now has his machine.

There could hardly be a more conclusive argument to show the utilitarian character of the automobile than that furnished by these figures. The farmer uses his car mainly for driving to town. While he may occasionally make the trip purely for pleasure, as a rule it is business of one kind or another that compels him to make it. With the increasing amount of machinery of all kinds in use on the farm it becomes necessary to drive to town more frequently. The whole method of conducting farm business has been changed by the advent of the automobile. Discussing the "gasless Sunday" rule of last fall and the possibility of still greater restrictions on the supply of gasoline, which might also be extended to that part of the country west of the Mississippi, an Iowa dairy farmer said that without the use of his car he simply could not continue his business.

Another interesting feature in connection with the registration figures is the rather irregular rate of increase. If we make an exception of New Jersey, the states at the head of the list showing the rate of increase are all Southern states. There are several reasons to explain this fact. Most of the Southern states have as yet only a comparatively small number of cars, so that a large proportional increase does not mean a very large absolute increase in the number of cars. New Jersey stands rather alone among the states with a high proportional increase, far from her neighbor states of New York and Pennsylvania. She has made up the former lead of these states in respect to "density of automobiles" and now is on a substantially equal footing with them.

It is only natural that the proportional annual increase in automobile registrations should gradually decrease, and the figure of 20 per cent for the whole country for the year 1918 is remarkably good, considering the circumstances. The full effect of the war's interference with automobile production will probably appear only next year.

Tests of Piston Rings

IT is a great pity that there is not some quick and reliable method for making comparative tests of piston rings. A large amount of ingenuity has been spent in recent years in attempts to improve this rather unimportant looking part of the engine. The claims made for the different special rings are all very much the same and there is no readily available method of checking them up.

How important any slight improvement is from the standpoint of fuel economy may be judged from a recent estimate placing the number of piston rings annually produced in the United States at 200,000,000. This figure may be slightly too high, but when it is considered that one automobile factory alone uses 16,000,000 rings per year it will be seen that it cannot be so very far off.

The two aims of practically all inventors of piston rings are uniform pressure all around the ring and elimination of the leakage path at the cut or joint. Formerly it was customary to obtain the necessary "spring" by making the ring to a larger diameter than the cylinder bore and compressing it after material had been removed at the gap, but lately there has been a tendency to produce the "spring" by hammering or peening, the ring being machined

to the diameter of the bore and then expanded. The advantage claimed is that in this way the pressure can be made more nearly uniform all around the ring.

Another change in the methods of ring manufacture has been the substitution of individually cast rings for cast-iron pots from which about a dozen rings are cut. From the individually cast rings very little material is removed in machining, and it is claimed that the chilled skin of the casting is more elastic or more springy than the core material. But the chilling also increases the hardness and therefore the wear of the cylinder walls by the rings. Recently the suggestion has been made to cast the ring blanks in a centrifugal machine so as to compact the iron while it is solidifying.

The automobile engineer whose duty it is to choose rings for an engine must often be in doubt as to the validity of the claims made for different designs. No generally accepted test for ring efficiency exists. Not even the pressure at different parts of the ring circumference can be accurately measured. Dynamometer tests, of course, will give some idea of the efficiency of the ring, but the difficulty is that when one set of rings is to be substituted for another for the purpose of a comparative test the engine must be dismounted and it is practically impossible to exactly reproduce all the conditions of the test.

Returned Soldiers

THERE is a tendency in some quarters to exaggerate the condition of the returned soldier. It is stated that he is not being given a fair chance to secure a job and that in many instances he is being turned loose without any opportunity of making a living and with a good chance of his money running short before he can get suitable employment.

It would not be correct to say that no such condition exists, because there are no doubt many instances where the soldier would like to get work and for a combination of reasons may not be able to get it. Taking the situation generally, however, as it applies to the Mid-West manufacturing districts centering about Detroit, the condition does not apply.

As a matter of fact there is a reluctance on the part of the soldier to return to the job he left. He is looking for something better, and in many cases camp life has put him in a frame of mind making him long for a rest more than for a job. At the Detroit government employment bureau soldiers come in now and then asking what are the chances of a job in a week or two.

A large majority of the factories and industrial concerns which are able to turn to peace-time pursuits are taking back the men who were drafted or who enlisted, and in practically every case the returned soldier is given the first chance for the job, if his qualifications are anywhere near those considered necessary.

In the smaller towns the problem of the returned soldier does not exist. It is those who have been attracted by the lure of the metropolis and decided to seek employment in the big city, which they perhaps had never seen until the war took them there, who constitute a problem. The farm and factory can absorb the returned soldier readily, the big city cannot do so equally well. The soldier who is brought home to the place where he enlisted or from which he was drafted is not going to prove a dangerous factor in the employment situation.

Air Mail Service

CAN we take our long-distance air mail service seriously? Recent map-making and experimental trips have revealed difficulties and irregularities that do not give any great amount of hope that long-distance air mail service is going to prove a success with the present type of planes. It would be folly, indeed, to go to any great expense until experiments on a small scale have shown exactly what can be expected.

The principal fact which has been learned from experience to date is that it is unwise to fly in stages of over 250 miles. If longer trips are to be made they should be done in relays. Another fact which is becoming apparent is that the Liberty engine, although a great war engine, is not the most satisfactory one for mail-carrying service. The fuel consumption of this engine ranges all the way from 26 to 32 gal. per hour, according to records of the flight fields, and this, of course, is not economical from a weight-carrying standpoint alone.

It must also be taken into consideration that an engine of this size and power requires frequent overhauling, and that after 50 hr. of flight there exists an uncertainty as to how much longer the engine will run without failure. It is a fact that Liberty engines have flown from 125 hr. and upward, yet it is the average that must be considered rather than the exceptional.

If the mail service is going to be materially benefited by the introduction of the airplane post on a large scale, it should be entered whole-heartedly, but a close study should be made of the type of engine and plane best adapted to the work. There is no doubt that we have a large store of Liberty engines on hand, and also a large store of the De Haviland type planes, but if these are not the most efficient type, before we get into the matter on a large scale it would seem wise to have worked out the best type of plane for the purpose and also to have carefully determined the length of the desirable stage. The pilots who recently flew from Texas to Detroit demonstrated the futility of the long-distance service under present conditions.

AT the coming S. A. E. meeting in New York much attention will be paid to the subject of fuels. In view of the present precarious fuel situation and the fact that the future of the automotive industry is absolutely dependent upon a rapid increase in the available fuel supply, the papers committee has certainly shown good judgment in making this the leading topic.

☐ Latest News of the

2000 to Attend S.A.E. Victory Dinner

Society's Chicago Meeting to Discuss Engines of Various Types—New York Has Big Program

NEW YORK, Jan. 15—More than 600 tickets already have been sold for the Victory Dinner of the Society of Automotive Engineers, which is to be held at the Hotel Astor on Feb. 6. It is confidently expected that the number of members and guests in attendance will touch and probably top the 2000 mark.

Plans for the Chicago meeting of the S. A. E., which will be held during the week of the passenger car show, have progressed to the point where a tentative program has been adopted. The meeting will be held in the afternoon of Jan. 30, and the program will comprise a number of short papers on truck, tractor and passenger car engines, with a discussion of the possibilities of air-cooled engines, as well as of steam engines. The evening session is to be preceded by a "Home-Coming" supper.

For the New York session the program has been considerably amplified, and as now arranged will include a report by Dr. David White, chief geologist of the United States Geological Survey, on the unmined supply of petroleum in the United States. This will supplement papers by Dr. E. W. Dean, of the Bureau of Mines, on the status of refinery practice, with particular reference to cracking methods; Dr. J. E. Pogue, who will give an interpretation of the engine fuel problem; Dr. H. C. Dickinson, of the Bureau of Standards, who will present a paper on the status of engine efficiency, and E. De Golger, who will give an estimate of the expense of the utilization of Mexican crudes. John J. Utz will give some historical notes on military truck standardization, and Major A. B. Browne is scheduled to outline some lessons in truck design developed in the war. George F. Crouch will present a paper on the application of the marine internal combustion engine to war needs. An entertaining and illuminating presentation on forest products for aircraft use will be made by Clyde H. Teesdale. Lieut. Alexander Klemin and Grover C. Loening will treat of proportioning planes to engines and of high-speed planes respectively.

The Navy Department will co-operate very generously in the program, Commanders H. C. Richardson and F. G. Coburn speaking on airplane and seaplane engineering and production. Starr Truscott will have dirigibles as a subject. It is hoped that Commander J. H. Towers will tell of the operation of naval aircraft.

Elgin in Good Financial Condition

CHICAGO, Jan. 15.—About 1000 were present at the annual stockholders' meeting of the Elgin Motor Car Corp. yesterday. The old board of directors was re-elected, with the exception of A. L. Tull, who resigned. His place was taken by William McMasters, industrial agent of the Indiana Harbor Belt Railway Co. The following directors were re-elected: C. S. Rieman, Gregory L. Baum, W. G. Knoedler, J. M. Smitheler and David Schnitzer. The meeting was a harmonious one throughout and the stockholders passed a resolution of thanks to the management for the satisfactory manner in which the company had been brought through the difficult war period.

England Plans World-Wide Airplane Service

LONDON, ENGLAND, Jan. 13—By Mail—England is laying plans to conquer the airways of the world, according to an exhaustive report which has just been made by the Civil Aerial Transport Committee, which was appointed especially to study future legislation both in the British Empire and among the Allied nations. The report urges that all the Dominion be encouraged to build up large air fleets for aerial mail and passenger transportation. None of the sixty members of the committee expressed any doubt that within a few years passenger lines would be running to all parts of the world. It is pointed out that state ownership of aerodromes and landing stations is necessary in the interest of national defense and highly desirable also for commercial purposes. In that part of the report dealing with the choice of air routes the committee suggests that New York be the Western terminus of the Atlantic route, and points to the advisability of designing and arranging for the establishment of sea stations in the form of ships approximately 600 ft. long with a clear upper deck of 400 ft. This would permit the use of airplanes instead of seaplanes. In an appendix the opinion is advanced that planes capable of flying 500 miles without alighting will fill all requirements.

$280 Reduction for G. M. C. ¾-Ton Truck

PONTIAC, Jan. 16—The General Motors Truck Co. has lowered the price of its ¾-ton truck, model 16, from $1775 to $1495, a reduction of $280.

Trade-Mark "Ford" More Than Name

Far Reaching Decision Gives Additional Protection Against Infringement

DETROIT, Jan. 13—"I am satisfied that the word 'Ford' is not merely the name of Henry Ford, or merely the name of any other man, it is the name of a machine."

This sentence is taken from the decision of Assistant Patent Commissioner F. W. H. Clay in an opinion reversing the decision of the trade-mark examiner in refusing to register the Ford Co. trade-mark as the business slogan for a new line of rubber goods which Ford proposes to market.

The decision is far-reaching. It not only gives manufacturers of all well known products additional protection against trade-mark infringement but it establishes a precedent by sustaining the contention that the Patent Office stand that names are not good trade-marks, does not hold true in all cases. While it does not bar men of similar surnames from doing business under the same, it prohibits them from using their own name as a trade-mark for their product if the goods they market represent articles similar to the output of another firm having established a reputation and marketing its output under the same trade-mark.

It is a final blow to the efforts of certain concerns to market automobile parts and accessories under the names of well-known companies. The Ford Motor Co., has not only had several cases of this nature to deal with, but a number other companies have also been obliged to combat like attempts to infringe upon their names.

In his ruling the Patent Commissioner says there is some force in the applicant's argument that when an automobile has become as well known as the Ford, it is the natural expansion of the regular business to make automobile tires and to extend the trade-mark to them on the basis of the rights acquired by the usage of the automobile itself. He declares it is his conviction that the Ford mark is a good mark at common law and is the exclusive property of the Ford Co., using the name as its trade-mark.

The commissioner holds that for a great many years the public has had a very wide familiarity with this exact form of this word as a mark on an automobile and parts of automobiles. He declares one cannot be justly ignorant of

Automotive Industries

Manufacturers Band Together

Organize to Facilitate Speedy Adjustment of Canceled Orders—Will Post Others

DETROIT, Jan. 13—Detroit manufacturers of war materials, who have millions of dollars tied up in supplies purchased to fill nearly $300,000,000 outstanding war contracts, all of which have been canceled since the signing of the armistice, have organized to facilitate a more speedy adjustment of those contracts still unsettled.

Leading manufacturers of Detroit and other cities in Michigan met here Friday, Jan. 10, and organized a local section of the National Association of Manufacturers of War Material. The duties of the Detroit branch will be to furnish manufacturers with information emanating from the Washington headquarters as to methods of filing claims and to communicate to members the situation with regard to federal action in adjustment matters.

Because of the money tie-up, a number of plants, especially the smaller ones, are in bad financial shape, it is said. One of the largest companies, however, has $4,000,000 invested in war materials practically useless for any other kind of work. Although the board of claims of the Detroit district department, organized for the purpose of compensating manufacturers for losses due to the abrupt termination of contracts, has been ready for work since early in December, only 24 claims have been presented. Three were approved and two withdrawn.

Delay is due to the vast amount of detail work necessary before the contractor can present his claim. All plants handling ordnance work in the district have either been instructed to suspend work or given a definite time by which contracts must be completed. Up to the present time industrial plants have accepted suspension orders on 260 contracts.

Five Per Cent Tax Retained in War Revenue Bill

NEW YORK, Jan. 15—The Conference Committee of the Senate and House of Representatives, which is considering the new war revenue bill, has retained in it a 5 per cent tax on the sale price of passenger cars, tires, inner tubes, parts and accessories. Previously the committee had eliminated the proposed 5 per cent tax on the sale price of motor trucks, but manufacturers are not altogether sanguine that the tax has been permanently eliminated. When the matter was voted on a number of members of the committee voted against the elimination of the tax, and it is for this reason that some fear is expressed that it may be put back in the bill. It is regarded as practically certain now that the 5 per cent on cars, tires, tubes and parts will be left in the bill. It seems likely that there will be no floor tax.

Farm Equipment Prices Will Be Maintained

KANSAS CITY, Jan. 14—Present prices of farm equipment will be maintained at the same level for an indefinite period, according to G. A. Ranney, of the International Harvester Co., and president of the National Implement and Vehicle Association. The assurances that prices would not be reduced or advanced in the immediate future was given at the meeting of the opening session at the convention of Western Implement, Vehicle and Hardware Dealers to-day. There were more than 500 dealers present at the first session.

Military Airplanes at New York Aeronautical Show

NEW YORK, Jan. 15—It is likely that the forthcoming aeronautical exposition, which is to be staged in Madison Square Garden, Feb. 27 to March 6, by the Manufacturers Aircraft Association, will house a number of military exhibits, including many types of American and allied machines as well as a number of enemy trophies. The exposition is assured of the co-operation of both the naval and military air services.

Metz to Make a Six

WALTHAM, MASS., Jan. 13—The Metz Co., which during the war virtually suspended the production of passenger cars to devote its entire facilities to the manufacture of products for the government, is shortly to place on the market a new six-cylinder model which will sell for $1,495. The friction transmission which has long been a feature of Metz cars has been discarded in favor of a three-speed selective gearset. The engine is rated as 45 h.p. and the principal units of the car include a semi-floating axle, semi-elliptic springs with Hotchkiss drive and an electric lighting and starting system. The wheelbase will be 117 in. and tires 32 x 4.

Cleveland Plant for Sparton Radiators

CLEVELAND, Jan. 15—The Sparks-Withington Co. will establish a plant here for the production of Sparton radiators. It will be operated by a local company.

Labor Situation in Detroit

Position Much Better Than Generally Believed—Surplus of Workers Will Be Absorbed Speedily

DETROIT, Jan. 13—The labor situation here seems to have originated many rumors. As a matter of fact it is not half so bad as is generally believed, and it would appear that politics is playing an important part in the issue. Local papers publish an interview with U. S. employment officials to the effect that approximately 30,000 men are out of jobs, and while these figures may be correct, they do not reflect the true state of affairs.

Employent statistics in normal times show that about 15,000 men are continually shifting from one job to another, and this normal floating labor surplus has now been augmented by 5,000 or 6,000 returned soldiers. A number of manufacturing plants are at present closed for inventory and many other firms, having been engaged in war work, have cut their operations in order to readjust their plans to resume production on a normal basis.

Of the returned soldiers now in Detroit, it is estimated that 60 per cent are well provided with money and are desirous of resting for a short period before seeking positions. Labor officials have found that ex-army men out of work will not accept any job which may be offered, but are taking their time and are picking those they consider the most desirable.

A recent announcement which was given considerable publicity, and which told of a serious labor surplus, may have been prompted, it is hinted, by a certain class of employers with the idea of counteracting the effect of Henry Ford's announcement of a minimum $6 wage scale to all employees in all his plants. Ford's new scale has caused considerable hard feeling in certain business circles. It has not met with the approval of government labor bureau men who declare it is causing a labor movement toward Detroit which is not helping local conditions. It is also said that a feeling of dissatisfaction has been created among the workers of other plants.

Automobile and truck makers aver that in from 60 to 90 days the great majority of the plants will be operating on a normal peace basis. Several companies will greatly increase their production schedules in order to care for unfilled orders as well as new business. Part and accessory makers also anticipate a busy year. Thus, labor conditions will quickly adjust them-

selves and the shops will rapidly absorb the present excessive labor surplus.

Although conditions at other Michigan industrial centers seem to be rather sluggish at present, manufacturers are optimistic as to the future and it is evident that increased commercial activity will solve the labor problem in the near future.

—

Two Released Aviators Return to Industry

WASHINGTON, Jan. 15—The United States Air Service continues to discharge its personnel daily. Among those who have recently secured honorable discharge are 1st Lt. Gerald A. Christopher, who will return to the Eclipse Machine Co. as assistant chief engineer, and Lt. Joseph Leopold, formerly chief engineer of the Walker M. Levett Co., who is now associated with the Jones-Matrola, Inc., New York, as mechanical engineer and sales manager.

—

Firestone Steel Products Co. Adds Three to Its Sales Personnel

AKRON, Jan. 15—The Firestone Steel Products Co. has added three men to its sales force. A. D. Droeger as manufacturers' representative, will travel throughout the entire country. C. W. Flick will cover the eastern territory. He was formerly assistant sales manager of the Mason Tire & Rubber Co., and assistant manager of pneumatic tire sales with the B. F. Goodrich Co. J. C. Bailey has been made western representative. He comes from the Mason Tire & Rubber Co.

—

Eight-Hour Day Adopted in Michigan

LANSING, Jan. 14—Eight hours is made a day's work in any mill, mine or factory in Michigan under the terms of a bill introduced this week in the Michigan house of representatives by John Holland of Gogebic County.

The bill, which is a short one, declares no person shall work more than eight hours in 24 "except watchmen and employees when engaged in making repairs or in case of emergency where life or property is in immediate danger." It states further that employees may work more than eight hours if paid time and one-half for all such over-time. It provides for the imposing of fines from $50 to $500 upon violators of the law.

—

New Officers and Directors of Auto Body

LANSING, Jan. 15—The Auto Body Co., at its annual meeting on Tuesday, added M. V. C. Jackson, A. C. Stebbins and H. F. Harper to its board of directors. L. J. Griggs was permitted to withdraw. The following new officers were elected: President, F. M. Arbough; vice-presidents, M. V. C. Jackson and H. E. Thomas; treasurer, E. S. Porter; secretary, F. C. Rush. The new general manager, M. V. C. Jackson, assumed duties Monday. The plant is now operating at about half normal capacity, turning out 200 bodies daily.

General Motors Buys Reliance

New Plant for Olds Motor Works—First Step in General Expansion Planned

DETROIT, Jan. 14—The General Motors Corp. has purchased the Reliance Engineering Co., Lansing. The purchase price of $290,000 includes 31 acres of land, and buildings with 250,000 ft. of floor space, which will be used for the future expansion of the Olds Motor Works.

The completion of the new motor building, 240 by 500, 700 ft. loading docks and additional sidings left little of the Olds Motor Works site, and later acquired old fair grounds property available for additional building expansion. This cramped condition is now relieved by the purchase of the Reliance company, which adjoins the Olds property on the east.

The sale of the Reliance Engineering Co. was effected privately and the court order confirming the sale was filed Thursday. At 11 a. m. on that date the plant was to have been sold to the highest bidder. Samuel T. Douglas of Detroit was receiver, named under the receivership growing out of the case brought by the Union Trust Co. of Detroit against the owners of the property.

The assets of the company are sold in entirety. The General Motors Corp. assumes all outstanding contracts. The plant consists of factory buildings, pattern shop building, pattern vault building, shipping and office buildings. They are brick one and two stories.

Several years ago the Reliance Engineering Co. organized to manufacture gas, gasoline and kerosene engines, hoists, pumping outfits and cream separators. It was placed in receivership March 9, 1917. Lack of working capital was given as the cause of receivership action.

—

DETROIT, Jan. 14.—Rumors that the General Motors Corp. is planning a period of huge expansion cannot be stilled. Although no definite announcement has been made by officials of the company, those who are in close touch with automotive conditions in Detroit claim that organization wheels have been set turning.

The expansion will undoubtedly affect all parts of the organization, although no advance publicity has been given out as to what will be done. While a great part of the new development will be in the production of motor cars, the manufacture of tractors will not be neglected, it is said.

—

Continental Plans 15 to 25 Per Cent Increased Production for 1919

DETROIT, Jan. 14—Officials of the Continental Motors Corp. have adopted a 1919 production schedule which calls for an increased engine production of between 15 and 25 per cent over the 1918 output. The two plants of the Continental Corp. produced approximately 180,000 engines last year, a large number of which were built for the Government.

The company has installed new machinery and is still working upon government work. It is making a four-cylinder engine, but expects to complete the contract some time in February. It is also announced that A. H. Zimmerman, treasurer of the company, has resigned. His place has been filled by G. W. Yoeman, formerly assistant to the president.

—

England Removes Gasoline Restrictions

LONDON, ENG.—(By Mail), Jan. 2—The Government restriction order, limiting gasoline consumption for private use, which was suspended until Jan. 10, has been revoked entirely. This concession enables motor vehicles to be used for any purpose without limitation of distance. Licenses to obtain gasoline are issued under the Finance Act, 1916, and the license feature must therefore remain in force. However, the Petrol Control Dept. is prepared to issue licenses to new applicants, and to increase the quantities allocated to existing license holders, and will endeavor as far as possible to meet all reasonable requirements.

—

Airplane Manufacture Unrestricted

LONDON, ENG.—(By Mail), Jan. 2—British government orders of 1917 and 1918 which prohibited the experimental manufacture without a license of any airplane, engine, or any part of such a machine have been suspended. "Experimental manufacture" under those orders meant any manufacture not under government contract, and included preparation of working drawings, but not of general arrangement drawings.

—

Standard Castings Co. Acquires Mastodon Tractor Tread

CLEVELAND, Jan. 15—The Standard Steel Castings Co., with headquarters here and in Chicago, has acquired the sales and manufacturing rights for the Mastodon tractor tread from the United States Traction Wheel Co. The Standard company is now in a position to supply the tread to tractor manufacturers.

—

Motor Parts Co. Organized

DETROIT, Jan. 15—The Motor Parts Co. has been organized here by M. F. Ketten, R. B. Merrill and E. F. Wilkinson, formerly associated with the Phillip McCracken Co., and will specialize in the production and marketing of axle shafts for all standard cars. The concern has established offices at 212 Telegraph Building. Mr. Ketten, president of the company, is also president of the Consolidated Truck Co. Besides axles, the Motor Parts Co. will market the Green automobile theft protector, a device upon which a patent is now pending.

Rubber Imports Rise 235 Per Cent

December Improves Greatly as Import Restrictions Are Lifted—3 Years' Totals

NEW YORK, Jan. 13—Since the War Trade Board lifted its restriction on the amount of raw rubber for importation, the imports for December, 1918, show a material increase over the preceding month, jumping from 3363 tons in November to 11,292 tons in December. The December tonnage, however, shows a decrease of 1478 tons as compared with December, 1917, and a decrease of 802 tons as compared with the same month in 1916.

The total imports for 1918 show a loss of 16,381 tons over 1917, but a gain of 39,686 tons over 1917. For the year 1916 imports totalled 115,609 tons; for 1917, 171,676 tons; and for 1918, 155,295 tons. The following statistics for the three years have been compiled by the Rubber Association of America:

	1916 Tons	1917 Tons	1918 Tons
January	9,162	12,788	16,084
February	1,597	10,162	13,108
March	10,070	18,624	17,161
April	10,014	13,000	12,703

Wisconsin Dealers to Gather

MILWAUKEE, Jan. 13—A two-day convention of motor car dealers of Wisconsin will be held under the auspices of the Milwaukee Automobile Dealers, Inc., during the twelfth annual show in the Auditorium, Jan. 24 to 30. The Milwaukee association in past years has devoted one day of show week to entertaining the dealers, but since an organization of state dealers was effected at a meeting held during the annual fall show in September, the congregation of the upstate tradesmen this time will assume the style and proportions of a real convention.

French Export Is Simplified

WASHINGTON, Jan. 13—Individual applications for export licenses for France will no longer be referred to the French High Commission, and individual applications for export licenses for Italy will no longer be referred to the Italian High Commission. This supplements the War Trade Board ruling 412, issued Dec. 13, 1918, and W. T. B. R. 453, issued Dec. 21, 1918. Exporters should be very careful before shipping to acquaint themselves thoroughly with the import requirements of the country of destination, as certain of the regulations which were in force prior to the signing of the armistice are still in full force and effect. Information as to French import restrictions may be obtained by applying to the French High Commission, 15th and M Streets, Washington, D. C., and for Italian import restrictions to the Italian High Commission, 1712 New Hampshire Avenue, Washington, D. C.

Export Conservation List Removals

WASHINGTON, Jan. 13—Additional removals from the Export Conservation List include the following, on which licenses will now be granted freely for export:

Ash wood
Balata
Birch wood
Chestnut wood
Crude rubber
Fir timber
Gutta-percha
Gutta-joolatong
Gutta-siak
Lumber
Mahogany wood
Metallic tin
Mica
Oak wood
Pig tin
Pine, yellow, measuring 12 in. by 12 in. and larger size, or 25 ft. long and longer
Plate, as follows:
  Terne
  Tin
Plywood and veneer of all kinds
Pulp wood
Quebracho wood
Rubber, as follows:
  Balata
  Crude
  Guayule
  Gutta-joolatong
  Gutta-percha
  Gutta-siak
Spruce wood
Tin, as follows:
  Block
  Metallic
  Ore
  Pig
  Plate
Walnut wood

Restrictions Lifted on Motor Imports and Exports

WASHINGTON, Jan. 15—The Government restrictions on the importation of agricultural implements, which includes farm tractors, were removed Dec. 24. On Dec. 19, the Government restrictions on the importation of cars, carriages and other vehicles, including motor cars and trucks, were also removed.

Many export limitations have also been lifted. It is understood that motor car, truck and accessory exporters have no difficulty in shipping to South America or to Spain. Permits from the Danish government must still be obtained when making shipment to Denmark.

The embargo prohibiting the importation of motor vehicles into England, France and Italy has not yet been lifted, so that no space is obtainable for such vehicles on outgoing steamers to those ports, although some accessories are being shipped. The necessity of procuring export licenses from the Shipping Board is still in effect.

$31,000,000 Wright-Martin Cancellation

NEW YORK, Jan. 15—It is reported that contracts held by the Wright-Martin Aircraft Corp., totaling $31,000,000, have been canceled. The greatest part of the cancellations will affect the Long Island City Government-owned plant, which was to have turned out 300 hp. Hispano-Suiza engines on a fee basis.

Fit Tractor to Farm or Vice Versa?

Economical Operation Hinges on Proper Answer, Says Farm Management Professor

MINNEAPOLIS, Jan. 10—Who will tell the farmer what he wants to know about tractors—what he must know if a tractor is to be an economical investment for him? The tractor manufacturer does not tell him in the literature he sends out. The tractor salesman does not tell him because he usually does not know himself and because his function is to sell the machine his employer builds. The dealer does not tell him because too often he has contracted to sell a tractor which he may have bought with too little regard to whether it is adapted to his local conditions, and it is up to him to sell it whether or no.

Must the farm be adapted to the tractor, or the tractor to the farm? This is the all-important question to the farmer if he is to make economical use of a tractor. Somebody must tell him—who is going to do it?

The question was asked by F. W. Peck, assistant professor of farm management, University of Minnesota, who spoke to the Minnesota retail implement dealers at their fifteenth annual convention at Minneapolis this week. Professor Peck took as his subject, "The Use of Tractors on Minnesota Farms," and he attacked it from an angle different from any ever before presented to a dealers' convention and one which must vitally interest every manufacturer of tractors.

Things Farmer Wants to Know

Every farmer who buys a tractor must ask certain questions, asserted the professor. These are:

1—Will a tractor do my work more rapidly than my horses can?
2—Will it do as good work?
3—Can I save hired help by using a tractor?
4—Can I farm more land with a tractor?
5—Are my fields adapted for the use of a tractor?
6—Will a tractor displace any of my horses?
7—Can I use a tractor to advantage in work other than plowing?
8—What size of tractor should I buy
9—How many acres will the various outfits plow per day?
10—How much does it cost to plow per acre?
11—Can I use a tractor

The fundamental idea developed by Professor Peck is that profit on the average farm depends upon the proper utilization of labor on the farm, and that in properly utilizing labor lots of power is used. Thus the question resolves itself into whether the tractor is the ideal power unit which will result in the proper utilization of farm labor.

In other words, the test of economy in tractor use is not the displacement of horses nor the cost per acre of plowing,

but the increase in the efficiency of the man per hour or per day.

If, by using a tractor, the man power is increased sufficiently, then the tractor is an economical proposition, otherwise not. For this reason the 11 questions asked by the farmer are logical, common-sense and necessary. Unless some one can answer them affirmatively, or definitely, as the case may be, the farmer cannot know whether or not his particular circumstances will justify the purchase of a tractor and he must take a chance. Taking a chance in farming, too, is likely to prove expensive. This means, therefore, that the manufacturer must build, and the dealer must sell, such a tractor that it will give satisfactory answers to these questions.

The net conclusion reached by Professor Peck is that at the present time the cost of tractor farming is in general no less than the cost of horse farming, irrespective of the fact that it has cost $150 a year to maintain a horse for the years 1917 and 1918, but that, inasmuch as the tractor, provided it is adapted to the particular farm, increases the product of the farm per man, therefore is an economical investment on the average farm of 160 acres and over.

Before adjournment officers for the ensuing year were elected as follows:

President, C. W. Lyman, Northfield, Minn.; vice-president, N. S. Solum, Hitterdahl, Minn.; directors, G. A. Meyer, Lake Elmo, Minn., and Aug. Lundgren, Warren, Minn.; delegate to the National Federation, E. P. Lynch, Faribault, Minn. C. I. Buxton, Owatonna, Minn., was re-elected secretary and treasurer.

Automotive Corp. President Addresses Automotive Engineers

CHICAGO, Jan. 11—"If it is desirable and convenient for the operator to be always on the tractor, then it is desirable and convenient for the farmer to do all his work riding on his horses," was the argument of A. H. Wyatt, president and general manager of the Automotive Corp. of Fort Wayne, Ind., which aroused interest at the monthly meeting of the Mid-West Section of the Society of Automotive Engineers last night.

Mr. Wyatt's paper was entitled "Line Control and Power Steering as Applied to Tractors," and consisted chiefly of a discussion of these features as developed in his design. Mr. Wyatt says that his tractor is just as docile and observant of the rules of the rein as is a horse. Every move the tractor makes is controlled by reins. Two reins are used to steer, operate the clutch and to control the engine speed, and a third is used to shift the gears.

Wyandotte Cleaner Ready

DETROIT, Jan. 11—The J. B. Ford Co., Wyandotte, is now marketing its Wyandotte metal cleaner. This product is intended to remove japan, shellac, paint, oils and greases, preparatory to recoating or repainting. It can also be used as a garage floor cleaner, as it has the quality of cutting and cleaning oil and grease.

Randles Resigns from M.T.C.

Will Return to Duties as Vice-President and General Manager of Foote-Burte Co.

WASHINGTON, Jan. 13—George E. Randles, vice-president and general manager of the Foote-Burte Mfg. Co., Cleveland, who for 16 months has been Director of Maintenance for the Motor Transport Corps, has resigned and will return to Cleveland.

Mr. Randles, during his connection with the Motor Transport Service, contributed greatly to the formidable program of that service, and his tenure of office is looked upon as a concrete illustration of the patriotism, subordination of individual interests to the needs of the Government and the sterling loyalty of the American business man.

Upon the acceptance of his resignation, Mr. Randles was called to the large reception room of the Transport Service and, in the presence of the personnel, officers and civilians, was presented with a gold watch as a token of the high esteem and kind regard of his co-workers. The presentation address was made by Lt.-Col. Edward Orton, Jr.

During his direction of the Maintenance Division Mr. Randles designed and standardized a base repairshop for Army use, which is capable of accomplishing tasks which no commercial or manufacturing institution can do. Also he built a crating shop at Camp Holabird, Md., where trucks can quickly be taken apart for shipment.

Another valuable contribution to the service has been the organization and training of the personnel whose work is the operation of these shops; the securing of the necessary thousands of automobile mechanics, the fitting of them into their respective niches and the drilling of them in the necessary team work to make their efforts efficient. This has been a complex task, but it was successfully handled by Mr. Randles. This work has been accomplished so as to make it possible to carry out not only the present program of the Army but it will also meet the demands of peace and be ready for any future wars.

Necessity of Roads Pointed Out

WASHINGTON, Jan. 13—The Senate Committee on Post Office and Post Roads, which deals with all congressional highways legislation, declared this week that there must be no letup in road construction despite the armistice, due to the need of roads for food distribution. Three measures are pending before Congress on highway matters which are designed to increase the national highways mileage and to improve those roads now in existence, as follows:

Joint resolution "200," authorizing the transfer from the War Department to the Department of Agriculture of all available dispensable and suitable war material for distribution to the highway departments of the several States for use on the highways.

Senate bill "5088," increasing the present unexpended appropriation of about $60,000,000 for road purposes by the addition of $125,000,000 for expenditures to June, 1920, and $100,000,000 a year thereafter for 4 years. It also is proposed to increase the appropriation for national-forest roads of $1,000,000 a year on the present 10-year road building program by a sum sufficient to construct 17,000 miles of forest roads, which the Government has already planned and which are necessary in order to utilize the vast resources of the national forests. The estimated cost of these roads is $50,000,000.

House bill "13308" carries an appropriation of $1,000,000 for an extension of motor-truck parcels post service. This is an increase from the $300,000 provided in the last post office appropriation bill, which also authorized the War Department to transfer to the Post Office Department motor trucks for which it had no further use. Under last year's appropriation 27 motor truck routes were established, all but one of which were operated east of the Mississippi River. The results, even in the initial stage, are such as to warrant an increase in the number of routes and their extension to the trans-Mississippi region, where rail and water facilities of transportation are altogether inadequate.

Senate bill "5088" has the approval of President Wilson and Secretaries Houston and Baker.

Additional Names of Chicago Exhibitors

CHICAGO, Jan. 13—Seven passenger-car, nine truck and twenty-four accessory exhibitors will have their products on display at the Coliseum, Jan. 25 to Feb. 6. The list of names is as follows:

Passenger Cars

Templar Motor Corp.	Cleveland
Maibohm Motors Co.	Racine
Dorris Motor Car Co.	St. Louis
Apperson Bros. Automobile Co.	Kokomo
Saxon Car Co.	Chicago
Rue Motor Co.	Chicago
Marmon Chicago Co.	Chicago

Trucks

Dorris Motor Car Co.	St. Louis
Panhard Motors Co.	Grand Haven, Mich.
Sanford Motor Truck Co.	Syracuse
Mutual Truck Co.	Sullivan, Ind.
Fulton Motor Truck Co.	Farmingdale
Fowler Motor Truck Co.	Chicago
Rue Motor Co.	Chicago
Available Truck Co.	Chicago
Diamond T Motor Truck Co.	Chicago

Accessories

Gray Heath Co.	Chicago
Hercules Buggy Co.	Evansville, Ind.
Jefferson Electric Mfg. Co.	Chicago
Johnson Auto Lock Co.	Chicago
Morand Bros.	Chicago
Natl. Wire Wheel Co. Works	Geneva, N. Y.
Perfex Radiator Co.	Racine
Trindl Machine Works	Chicago
U. S. Auto Supply Co.	Chicago
West Steel Casting Co.	Cleveland
Bell Tire & Rubber Co.	Chicago
Essenkay Products Co.	Chicago
Mitchell Bynon Co.	Chicago
Stahl Rectifier Co.	Chicago
Peter C. Cole	Chicago
Ahlberg Bearing Co.	Chicago
Empire Mfg. Co.	Binghamton, N. Y.
F. W. Wakefield Brass Co.	Vermilion, O.
Radium Dial Co.	Pittsburgh
U. S. Auto Gear Shift Co.	Eau Claire
National Mileometer Co.	Detroit
Holland Brass Works	Chicago
Inland Machine Works	St. Louis
Ahlberg Bearing Co.	Chicago

Boston May Get Truck Show

BOSTON, Jan. 13—There is more hope now for trucks being taken care of at the Boston show than there was a few weeks ago. At first it was figured out that the owners of Mechanic's building would rather keep the wool, flour, etc., stored in the basement where they would get a big rent week after week than have one week of a motor truck section. And that would mean a car show solely. Now there are plans to have the basement emptied and the entire show will be held in one week instead of planning to stretch it over two weeks.

Trial of Jobbers Is Begun

Jury Drawn for Legal Battle, Which Is Expected to Last About a Month

NEW YORK, Jan. 12—The trial of the members of the Jobbers' Association on a charge of violating the Sherman anti-trust law began to-day in the United States District Court in this city.

The first day was taken up with the usual preliminaries and the second day's session was not to begin until 2 p. m. because of other business to which Judge Hand must attend. It is anticipated that the trial will last about a month. The sessions are in the Post Office building in City Hall Square. The prosecution is being handled by District Attorneys Geyler, Matthews and Williamson.

The chief counsel for the defense is James H. Wilkerson, Chicago, formerly a United States district attorney. He is assisted by Claude A. Thompson and Emory Buckner, New York, both experienced in Government cases. The following men are represented by their personal attorneys: George Edmunds, Edmunds & Jones, Detroit, by Attorney L. W. Goodenough; T. M. Brooks, Automobile Supply Co., Chicago, by Attorney C. M. Peters; William K. Norris, McQuay-Norris Mfg. Co., Chicago, by Attorney John F. Greene; F. B. Caswell, Champion Spark Plug Co., Toledo, by Attorney Edward J. Marshall.

The jury was drawn to-day. It is said that an unusual number of witnesses has been called by both sides and it is expected that the case will be fought with unusual vigor by both sides.

Representatives of other trades and trade organizations are interested in the outcome and the representative of at least one other organization, from Texas, is here to watch the proceedings.

Would Establish 600 Motor Truck Routes

WASHINGTON, Jan. 13—Establishment of motor truck routes as a means of reducing the cost of living by transporting farm product to the cities was advocated yesterday by Fourth Assistant Postmaster General Blakslee in asking the Senate Post Office Committee to appropriate $8,975,000 in the Post Office bill for that purpose. Under the House bill $1,000,000 is provided to be used in extending the plan.

No Change in Gasoline Price Likely in Canada

TORONTO, Jan. 13—It is unlikely that there will be any change in prices of gasoline and oils. The flat rate plan, which was put in effect by one of the large firms last April, will be continued. A number of firms handling gasoline and oils have been urging the adoption of a standard rate, but so far little progress has been made.

Some of the oil men are not inclined to regard the plan as feasible for the Dominion, basing their views on the long hauls to various points. In spite of the large falling off in fuel oil sales owing to the closing of munitions plants, the price has only dropped a cent a gallon. The manufacturers are meeting the situation by lessening the output of fuel oil and increasing the production of gasoline. It is stated that the shortage of coal in many districts this season is causing much larger demands than usual for oil for fuel.

Japanese Commission Visits Nash Motors

KENOSHA, Jan. 13—Charles W. Nash and the Nash Motors Co. last week entertained the commission of Japanese army officials who are making a tour of military manufacturing centers of the United States in behalf of the government of Japan. The commission consists of Maj. Saburo Yamanaka, Maj. Tomotsugu Tohara, and Maj. Zenturo Miki. Mr. Nash tendered the visitors a luncheon, following which the big Nash plant was inspected.

Price Changes

Hupp Prices Reduced

DETROIT, Jan. 13—The Hupp Motor Car Co. has reduced the price of its roadster and touring car. The prices of the other models remain unchanged. The new price list is as follows:

Model	New Price	Old Price
Roadster	$1335	$1500
Touring Car	1335	1500
Coupe	2100	2100
Sedan	2185	2185

Grant Prices Down $25

CLEVELAND, Jan. 13—The Grant Motor Corp. has revised the prices of its models as follows:

Model	New Price	Old Price
Roadster	$1220	$1245
Touring Car	1220	1245
Sedan	1745	....
Coupe	1725	....
Detachable Sedan	1500	....

Peerless Prices Advanced

CLEVELAND, Jan. 14—The Peerless Motor Car Co. has advanced its prices as follows:

Model	New Price	Old Price
7 Passenger Touring	$2,760	$2,550
4 Passenger Roadster	2,760	2,550
4 Passenger Coupe	3,320	3,050
7 Passenger Sedan	3,580	3,250
7 Passenger Sedan Limousine	3,720	3,690

Oakland Prices Drop

PONTIAC, Jan. 14—The Oakland Motor Car Co. has reduced the price of all 1919 commercial car models $110. The price list is as follows:

Model	New Price	Old Price
Touring Car	$1,075	$1,185
Roadster	1,075	1,185
Sedan	1,650	1,760
Coupe	1,650	1,760

Liberty Fuel Proves 65% Benzol

Results of Tests by Fuel Administration Revealed—Nearly 30% Kerosene

WASHINGTON, Jan. 14—Liberty Fuel, announced several weeks ago as having been discovered by Captain Wiesgerber, is largely benzol. As a matter of fact it is 65 per cent benzol mixed with 25 to 30 per cent of kerosene with a small percentage of amyl acetate. The Fuel Administration has completed an anlysis of the liquid which shows that these are its principal ingredients. History reveals that there is nothing new in the mixture of benzol and kerosene. As long ago as 1911 and 1912 a number of tests were conducted on the Brooklands Speedway in England on such a mixture which at that time proved quite satisfactory. The limiting factor in the use of such a mixture, however, is the small amount of benzol available and the expense in producing it. It is considered improbable by oil experts that the cost of producing benzol in quantities necessary to make it commercially valuable as a substitute fuel can be brought down to the point where it can be sold as cheaply as gasoline.

The principal difficulty in using benzol is that it solidifies at comparatively high temperature as compared with gasoline. For example, benzol will crystallize at 18 deg. Fahr. On the other hand the boiling point is 175 deg. Fahr. as against about 140 deg. for the average grade of good gasoline. This would indicate that it would be more difficult to start a cold motor on a benzol-kerosene mixture than on gasoline.

Large Space for Accessories at K. C. Tractor Show

KANSAS CITY, Jan. 14—So many unique features have been planned for the coming tractor show to be held in this city Feb. 24 to March 1 that it will be quite a departure from the usual trade display. One of these is the extra large amount of space which is being taken for tractor accessories.

Another feature is that nothing will be allowed upon the grounds except tractors and their accessories. There will be no side shows, no opportunity for a man to exhibit something which does not strictly belong to the aim of the exhibit.

Again no souvenirs will be allowed, no presents to attract visitors to particular exhibits. The only matter allowed to be given away will be literature describing the articles the dealers has to display. Neither will there be any catalogues this year.

Winton Shifting Back to Peace Time Production

CLEVELAND, Jan. 15—All the old officers and directors of the Winton Co. were re-elected at the annual meeting

held Tuesday. The company, which has been devoting its efforts entirely to war work, is gradually shifting back to a peace basis. It is still working on government contracts, but is resuming production at the rate of about five cars daily.

100,000 Ford Tractors for 1919

DEARBORN, Jan. 15—Production of 500 Fordson tractors daily within the next 90 days is called for in the new output schedule of Henry Ford & Son Co. The plant is at present turning out 225 machines daily, and within 30 days will be hitting well above the 300 mark. Officials of the company announce that the 1919 production schedule calls for the completion of 100,000 tractors. This is more than three times the 1918 output, when 30,000 tractors were made and sold.

Hansen Leaves Stewart-Warner to Manage Standex

CHICAGO, Jan. 15—V. N. Hansen has resigned as sales supervisor at the Stewart-Warner Speedometer Corp. He will devote his time to the management of the Standex Mfg. Co., which he has organized with offices and plant at 341-349 E. Ohio Street, to manufacture and market motor specialties under the trade name "Standex." Prior to his connection with Stewart-Warner, Mr. Hansen was engaged in the manufacture of the V-Ray spark plug at Marshalltown, Ia.

Monroe Motor Co. at Receiver's Sale

PONTIAC, MICH., Jan. 14—The receiver's sale of the manufacturing plant of the defunct Monroe Motor Co. will be held here Jan. 25, at 1 p. m. The factory property consists of modern buildings having 100,000 ft. of floor space, sprinkler, heating and lighting systems, and is suitable for automobile, truck or tractor manufacture.

New Studebaker Plant for 100,000 Annually

SOUTH BEND, Jan. 14—The Detroit plants of the Studebaker Corp. will continue the production of six-cylinder cars and parts; the new Studebaker plant here will be devoted to the production of the new light-four. The new South Bend plant will have an annual capacity of 100,000 cars.

Olds Production to Exceed Normal

LANSING, MICH., Jan. 14—The Olds Motor Works expects to reach its normal pre-war production by Feb. 1. The factory is now running at 80 per cent of its normal capacity. The company contemplates to increase its production to exceed by 25 per cent all previous records.

Spencer With Indiana Electric Steel Co.

INDIANAPOLIS, Jan. 15—M. G. Spencer, formerly connected with the Midvale Steel Co. and later with the Watertown Arsenal as chief chemist, is now in charge of the metallurgical operation of the Electric Steel Co. of Indiana.

2,000,000 Tractors on Farms in 10 Years

Agronomist Taylor Makes a Startling Prediction—Says Three-Bottom Is Best

KANSAS CITY, MO., Jan. 15—That 2,000,000 tractors would be operating on the farms of this country within the next 10 years was the startling prediction made this morning by W. E. Taylor, agronomist, of Deere & Co., Moline, to the members of the Western Association of Implement and Vehicle Dealers in session in this city. These 2,000,000 tractors, said the speaker, would displace 50 per cent of the horse-drawn implements used on the farm at present. The 240 concerns making tractors, he asserted. will build 200,000 machines during the coming year.

In discussing the operating efficiency of the present type of tractor, Taylor gave it as his opinion that it has not proved its adaptability for every kind of soil. For example, it was not suited for steep hills or side hills, nor was it adapted to perform on rough or stony soil. However, wherever it could be used it reduced the cost of farm operation and increased production. He cited the results of the Harrisburg demonstration as typical of tractor operation costs.

The three-bottom plow, in Taylor's opinion, was the most economical machine for average farm use. The two-bottom unit, he said, did not show any economy over horse operation. On the other hand, the three-bottom machine and one man could accomplish as much work as two men and ten horses.

The future of agriculture, said Taylor, depended for its growth upon the development of the tractor, and as an earnest of this conclusion he advised the dealers to push the sale of tractors.

The Century Theater, where the convention is being held, was crowded, although the attendance was not as great as in past years. Governor Allen of Kansas also delivered an address.

Fuel Conservation Orders Withdrawn

WASHINGTON, Jan. 15—All fuel conservation orders have been withdrawn by the United States Fuel Administration in so far as relates to coal, and industries can now use any quantity of coal they desire or require. This information was made public to-day in a formal announcement by the United States Fuel Administration.

Portland Show Feb. 24-March 1

PORTLAND, OREGON, Jan. 20—The Portland Automobile Dealers will hold a show Feb. 24 to March 1 in the Portland Auditorium, which affords 40,000 sq. ft. of floor. The show will be limited to the membership of the association, which has 38 members, and will contain probably 44 makes of automobiles, 24 makes of trucks and 6 makes of tractors, as well as considerable automotive equipment. The dealers' state manager, M. O. Wilkins, plans to stage a run a couple of weeks before the show from Portland to Seattle, and has invited the Washington dealers to come to Portland for the show. They also expect to have the Oregon County dealers come to Portland during that week, and it is probable that a meeting will be held Friday, Feb. 28.

Jobbers Meet June 2-6

CHICAGO, Jan. 20—The Automotive Equipment Association, the jobbers' association with its new name, will hold its next meeting June 2, 3, 4, 5 and 6 at the Homestead Hotel, Hot Springs, Va. June 2 and 3 will be taken up with meetings of committees and the directors. The general sessions will be held June 4, 5 and 6.

Sunbeams for Indianapolis Race

PARIS, FRANCE, Jan. 15—Special Cable—Two more foreign drivers have been entered for the 500-mile race on the Indianapolis Speedway, May 31. The British Sunbeam company has entered two cars which are to be driven by Chassagne and Christiaens. It is considered probable that the Fiat company will start a car, though no driver has been nominated yet.

Trade-Mark "Ford" More Than Name

(*Continued from page* 186)

what everybody knows. The use of the term has become so extensive, he adds, that he is convinced there was a time when the word "Ford" did not mean the individual in Michigan who is named Henry Ford, but primarily meant a particular kind of automobile. "The automobile is probably known by numerous people," he continues, "who are not aware of the fact that it is a man's name." He declares it is probable that the man Henry Ford first became widely known because of the reputation of the automobile rather than the automobile becoming known because it was made by Henry Ford.

The commissioner holds that the Ford Co. has a right to curtail the liberties of another by the name of Ford if the other Ford attempts to market automobile parts and accessories under the name of a famous automobile. He declares the right is not in the name but in the particular use of the name, and adds that it is hardly conceivable that another Ford could in mere ignorance infringe upon the Ford company's mark.

In conclusion he avers that if Ford was at one time merely a surname it is now no longer so. It is now as truly an index of a reputation and a mark of origin as any mark one could think of and he declares it ought to be registered as the courts have held it may be monopolized.

Morgan Chief Engineer for Cleveland Co.

CLEVELAND, O., Jan. 15—Major N. B. Morgan has been appointed chief engineer of the Cleveland Tractor Co. He had been engaged in automobile engi-

neering for 14 years until June, 1917, when he was appointed assistant to the chief of the Ordnance Department of the Army.

—

Latin-American Tractor Possibilities

WASHINGTON, Jan. 13—Extensive areas of agricultural land in Latin-American countries offer a rich field for the development of farm tractor trade, states a special tractor report compiled by the Bureau of Foreign and Domestic Commerce. Many of the estates, comprising hundreds of thousands of acres, still cultivate their crops of grain, sugar, and cotton under the old systems, that require large numbers of laborers and horses.

Power farming on these great plantations invariably shows economy of time and expense, and the recent increase in shipments of tractors from the United States to Latin America indicate that the more progressive ranch owners are beginning to realize the value of new methods. In the fiscal year 1918 more tractors were shipped from this country to the Latin American countries than in all the four last years preceding, and in the first quarter of the 1919 fiscal year these exports amounted to more than a third of the total 1918 shipments.

The direct cause of this unprecedented demand for tractors in Latin America is doubtless the awakened interest in agriculture growing out of war-time needs and prices. The value of the tractor in increasing the agricultural production of Latin America is almost equalled by its importance as a road maker. The lack of transportation facilities is acutely felt in some of the richest sections of South America, and the tractor is proving of incalculable advantage in the construction of needed highways.

One of the chief obstacles faced by the manufacturer in the introduction of tractors is the natural aversion of a conservative rural community to new and complicated mechanical appliances. Inexperienced operators, failing to meet with success in the use of an untried machine, condemn and abandon it. The manufacturer must prepare to overcome this difficulty by providing ample instructions and demonstrations and should, moreover, take special pains to furnish the proper kind of tractor for the particular class of work desired.

Another obstacle in selling tractors in Latin America is the high cost of gasoline, but it is probable that with the close of the war there will be a reduction in the price of this fuel. In contrast with the scarcity of fuel for tractors, the ranch owner has available a large supply of horses and practically unlimited natural pasture, making his outlay for animal power comparatively small.

To meet this condition the manufacturer must demonstrate that the land can be much more quickly and evenly worked, and to a much greater depth, with the use of a tractor than with horses.

Tire Export Figures Are Satisfactory

Average Monthly Value for 5 Months Ending November in Excess of That of Previous 12 Months

NEW YORK, Jan. 15—Supplementing the information given in tabular form covering exports of automobile tires by countries and years, given elsewhere in this issue, the following figures representing the value of tire exports during July, August, September, October and November are of interest as indicating that our export trade is being maintained despite shortage of crude rubber and the fact that the cars of many countries are restricted in operation in consequence of the scarcity of gasoline. Our exports of automobile tires for the five months are as follows:

1918	Value
July	$1,217,584
August	1,566,589
September	1,321,034
October	930,204
November	1,268,845
	$6,304,256

During the fiscal year which ended June 30, 1918, our monthly average value of automobile tire exports was $1,166,472. For the four months enumerated above the average per month is $1,260,851.

Pro and Con of Government Railroad Ownership

Sentiment Appears Against It in General, and Both the Association of Railroad Executives and the Holders of Railroad Securities Oppose It

NEW YORK, Jan. 13—During recent weeks there has been a great variety of conversation and "news" about the railroads. There has been a lot of talk about Government ownership, but there is no well defined faction that has come out in favor of it. A few newspapers have advocated it, but *sentiment generally seems to be not in favor of the operation of the railroads by the Government*. However, there is a lot of conversation on the subject of Government ownership.

Early this week, Dow, Jones & Co. sent out from Chicago a lengthy telegram addressed, presumably, to a large number of business publications, among them AUTOMOTIVE INDUSTRIES. The telegram is reproduced herewith:

There are two well defined factions at work:

1—*The railroad executives' association, which is made up of the men who manage the roads.*

2—*The "Warfield faction," consisting mostly of presidents of insurance companies, presidents of banks and trust companies and others, who are the owners of the railroad properties.*

Faction No. 1 is, therefore, the men who manage the roads. Faction No. 2 is the people who own the roads.

Both factions are working toward the same end in that they are opposed to Government ownership.

Faction No. 1, the managers, has advanced a definite plan.

Faction No. 2, the owners, will shortly announce a plan, but has not as yet except that it opposes Faction No. 1's plan.

It is said by some that Faction No. 1, the managers, is trying to carry water on both shoulders, so that their jobs will be safe no matter what happens.

Faction No. 2, the owners, wants the investment in the properties safeguarded.

The Executives' Plan

Faction No. 1, the road managers and executives, wants Government regulation and protection, but NOT Government ownership. It proposes:

A—*Federal incorporation, which would be incorporation nationally instead of in states, as at present.*

B—*A director general of railroads with a seat in the Cabinet of the President of the United States.*

Faction No. 2 will announce its plan shortly, but inasmuch as neither faction will write the bill that Congress must pass on the subject, both factions are disseminating information, and the reading of conflicting stories leaves the average reader somewhat up in the air.

The statement that AUTOMOTIVE INDUSTRIES received concerning Warfield was prompted, it is stated, by the fact that John J. Mitchel, a Chicago banker, who is also vice-president of Warfield's "securities owners' association," was reported the other day to have come out in favor of Government ownership. The telegraphic statement denies that Mitchel favors Government ownership.

Recently Warfield has issued other statements in favor of his ideas. The statement that AUTOMOTIVE INDUSTRIES received was sent from Chicago by Dow, Jones & Co., which prints the *Wall Street Journal* and also operates a ticker and news service. It frequently sends out statements for financial men as a matter of courtesy, which, it states, it did in this case.

Warfield is president of the Seaboard Air Line, a large southern road with 3000 to 3500 miles of trackage and which in 1917 did over $30,000,000 of business. He is also president of the Continental Trust Co. of Baltimore. He some time ago organized and is president of the National Association of Owners of Railroad Securities. He, at the time the Government took over the roads, was active in securing for the roads better contracts than the Government at first offered. It is said that many of the executives in Faction No. 1 are in accord with Warfield's ideas.

SPECIAL DISPATCH FROM CHICAGO TO AUTOMOTIVE INDUSTRIES: CHICAGO, ILL., Jan. 10.—S. Davies Warfield, of Baltimore, president of the National Association of Owners of Railroad Securities, and of the Continental Trust Co., of that city, has been in Chicago since Monday in consultation with the executive committee of the National Industrial Traffic League in connection with plans for the return of the railroads to private operation. As a result of these conferences, it is understood he has adopted many suggestions made by the committee. Mr. Warfield was also in consultation with John S. Miller, of the law firm of Miller, Starr, Brown, Packard & Peckham, who is one of the advisory counsel of the securities association, together with ex-Senator Elihu Root, John G. Milburn, New York; Hugh L. Bond, Jr., Baltimore, and Forney Johnston, Birmingham, Ala.

He conferred with Luther M. Walter, of general counsel of the association and of the firm of Borders, Walter & Burchmore; also with John J. Mitchel, president of the Illinois Trust and Savings Bank, who is vice-president of the Securities Association.

Asked regarding Mr. Mitchel as having been quoted as in favor of Government ownership, Mr. Warfield in passing said: "The intentions of Mr. Mitchel at the time were misunderstood; he is no more in favor of Government ownership than I am." Being told that Director General McAdoo had resigned and would immediately return the railroads to their owners, Mr. Mitchel states: "If this takes place without remedial legislation the financial chaos will be disastrous, and I would prefer Government ownership."

The National Industrial Traffic League is of national scope and represents through constituent membership leagues and others over 250,000 shippers of the country. The executive committee, which has been in session here since Monday, is composed of members of traffic bodies located throughout the country.

Before leaving for the East, when asked regarding the securities association's plans, Mr. Warfield said: "The National Association of Owners of Railroad Securities represents in membership over $5,000,000,000 of the $17,000,000,000 railroad securities in the hands of the public, when you consider that the one-fourth of the total investments of the great life insurance companies are composed of railroad securities; that over 30,000,000 unduplicated life insurance policies are outstanding; that every life insured has, therefore, one-fourth of the provision made after death invested in railroad securities; that 50,000,000 people, nearly one-half the country's population, have a financial interest in the railroads, you can form an idea of how important become the methods under which these properties are to be returned to their owners.

"The responsibility of Congress in providing for this large proportion of our population, together with the business interests of the country, is very great. Unless the railroads are returned under safe and sane methods, the credit structure of the country will not stand the strain and all business will suffer accordingly.

"Our membership includes nearly all the life insurance companies, and directly represents over 25,000,000 of the 50,000,000 investors in railroad securities. These include depositors in mutual savings banks, holders of life policies, individuals, trustees of estates, universities, colleges and fiduciary institutions.

"The executive committee of the securities association has been working on plans for the return of the railroads that shall be fair to all alike. The interests of the shippers and the security owners are largely identical; without adequate railroad facilities the business of the country halts; without the co-operation of the shippers a fair and adequate return cannot be had on railroad investment to afford facilities and service essential to business success.

"My visit to Chicago is in connection with the policy adopted by our association to co-operate with and ask in return the co-operation of the shipping interests in plans for the return of the railroads. Conferences have also taken place in Washington and elsewhere with representatives of the shippers and others from various sections of the country. We are gratified at the evidence of desire to co-operate for the general good. Unless we are tolerant of the views and interests of all and a spirit of 'live and let live' during these days of reconstruction prevails we shall not have learned the lesson for which the blood of millions of men has been shed.

"The conferences with the executive committee of the National Industrial Traffic League have been productive of gratifying results. We shall adopt many of the suggestions made."

Mr. Warfield said that the plans of the association, now nearing completion, will shortly be presented to the Senate committee now holding hearings at Washington.

Mr. G. M. Freer, of Cincinnati, and president of the traffic league, said last night: "The executive committee of the league is appreciative of the co-operative spirit shown by Mr. Warfield in the several days' conferences with our committee and our members, and good results must necessarily come of it.

"This is the first time the owners of the railroad properties have extended hands to the shippers and it cannot fail to produce good results. I think it can be said that the shippers of the country realize, and the war has emphasized it, that unless the railroads are given reasonable return on the investment in them and on the money required to give the shippers additional facilities and service in proportion to the increase in their business, we offer as much as those who own the railroads.

"We are considering the whole subject. The purpose of Mr. Warfield and those of our committee are not far apart. The league will send representatives to Washington to present its views to the Senate committee."

It is understood that the committee of the traffic league is opposed to the compulsory federal incorporation of the railroads and also to the creation of a single political government head for the control of the railroads.—Dow, Jones & Co., 208 S. LaSalle St., Chicago.

Hollis Buys American Strawboard Co.

TIFFIN, OHIO, Jan. 14—The Hollis Tractor Co., Pittsburgh, a company capitalized at $2,500,000, has purchased the plant of the American Strawboard Co., and will begin the manufacture of farm tractors within 30 days.

Clas President of Lewis Steel Co.

MILWAUKEE, Jan. 13—Angelo R. Clas, secretary of the Falls Motors Corp., Sheboygan Falls, Wis., has resigned to become president and general manager of the Lewis Steel Co., Toledo, in which concern he recently acquired a financial interest.

—

E. A. Scheu, formerly Eastern district manager of the New York branch of the King Motor Car Co., has been made sales manager with headquarters in Detroit.

—

R. M. Mann, who was in charge of the Brooklyn branch of the King Motor Car Co., has been made assistant sales manager of the home office.

—

J. R. George, formerly connected with the F. S. Carr Co., Boston, makers of automobile fabrics, has become assistant sales manager of the Barley Motor Car Co., Kalamazoo.

—

Gilbert U. Radoys has been appointed advertising manager and assistant sales manager of the Haynes Automobile Co., Kokomo. He has been previously associated with the Hudson Motor Car Co., the Packard Motor Car Co., Detroit, and with the Nordyke & Marmon Co., Indianapolis.

—

D. F. Edwards, treasurer of the Gier Pressed Steel Co., Lansing, has returned to that city and will resume his work at the plant. He held the rank of major in the purchasing and supply division at Washington.

—

Lee Anderson, lately vice-president of the Hupp Motor Car Corp., and recently director of Aircraft Production in the Detroit zone, has severed his connection with the Hupp company to become affiliated with the Theo. F. MacManus Advertising Agency. He will be succeeded in the Hupp company by Oliver C. Hutchinson, who has been supervisor of wholesale branches and sales manager.

—

Milton J. Budlong has retired as vice-president, general manager and a director of the export firm of Gaston, Williams & Wigmore, New York. He has also retired as a director and vice-president of the Globe Steamship Line. His plans for the future have not been made public.

—

Leo N. Burnett, having received his honorable discharge from the Navy, has returned to Detroit and is back at his old position as advertising manager of the Cadillac Motor Car Co. He relieves John A. Cleary, who has returned to Philadelphia to again become promotion manager for the Automobile Sales Corp.

—

P. J. F. Batenburg, chief engineer and designer of the Four Wheel Drive Auto Co., Clintonville, Wis., has severed his connection with the company. He has not yet made any other connection.

Men of the Industry

Changes in Personnel and Position

Frankel Is Now Roller-Smith Co. Assistant Sales Manager

M. Frankel, formerly manager of the Chicago office of the Roller-Smith Co., makers of electrical instruments and circuit-breakers, New York City, has been promoted to the position of assistant sales manager. He will remain at the Chicago offices at 740 Monadnock Building and will supervise its activities, as well as those of the Cleveland office at 711 Williamson Building, and also of a new office which will be established in Detroit at an early date. The latter will be a direct factory branch.

—

Rex W. Wadman has opened a western office in Chicago at 72 West Adams street.

—

J. H. Ficken has resigned from the Carlisle Cord Tire Co. and will in future be connected with the Kelly-Springfield Tire Co.

—

Louis Rosenberg has been appointed advertising and sales manager of the Keystone Tire & Rubber Co., New York.

—

Frank B. Barnett, for 15 years Chicago manager for the Class Journal publications, has resigned that connection to assume the vice-presidency of Motor Life, New York.

—

Homer Blocker, who has been assistant for the past 2 years, has been appointed advertising manager of the Republic Rubber Corp.

—

Norval A. Hawkins, for 10 years sales manager of the Ford Motor Co., has resigned to give all his time to his own business interests. Mr. Hawkins was first appointed auditor of the company, and in December, 1909, was made commercial manager.

—

J. M. Harris, for 5 years service manager of the Milwaukee branch of the Packard Motor Car Co. of Chicago, has been promoted to manager of passenger-car service of the headquarters in Chicago. He is succeeded by W. J. Neumyer.

—

N. F. Ozburn, who has been a lieutenant in the navy, and **Dunbar Abston,** lieutenant in the Field Artillery, composing the firm of Ozburn, Abston & Co., have secured their release from active duty, and are now back in Memphis.

—

Thomas L. Moore has been appointed southwestern district manager for the General Tire & Rubber Co., and will have headquarters at Dallas.

Jackson Leaves Briscoe for Auto Body

LANSING, Jan. 9—W. V. Jackson, vice-president of the Briscoe Motor Corp., of Jackson, Mich., will assume the permanent management of the Auto Body Co., this city on Jan. 15. A. C. Stebbins, vice-president of the Auto Body Co., has been acting as general manager until a suitable man to fill the vacancy can be found. Mr. Jackson has been vice-president of the Briscoe Corp. two years. He was formerly general manager of the A. O. Smith Corp., Milwaukee, and was with that concern five years.

—

A. M. Whaley has been appointed southern sales manager for the General Tire & Rubber Co., with headquarters at Atlanta. He was formerly southern district manager for the Kelly-Springfield Tire Co.

—

Otis H. Adams has been appointed advertising and sales promotion manager of the Connecticut Telephone & Electric Co., Meriden. Formerly he was with the Martin V. Kelly Co., and prior to that was connected with the Class Journal Co.

—

James E. Wood has been appointed manager of the Cleveland office of the Roller-Smith Co., at 711 Williamson Building. He assumes the position formerly held by C. S. Ripley.

—

V. L. Kloepper has been appointed chief engineer of the Automotive Department of the National Tool and Mfg. Co., St. Louis. He was formerly designing engineer for the Dorris Motor Car Corp., St. Louis.

—

D. G. Caywood has been appointed special representative of the Black & Decker Mfg. Co., Baltimore. He will carry on the field work for the distribution of the Black & Decker specialized products. The appointment was effective Jan. 1. Mr. Caywood was formerly sales manager of the Brunner Mfg. Co., Utica, N. Y.

—

Ford Wages Aggravate Labor Discontent

DETROIT, Jan. 13—Henry Ford's recent announcement of a $6 minimum wage scale has started a slight labor movement towards this city, which is having a tendency to aggravate present labor conditions here. Conditions at best are none too good.

Labor officials are endeavoring to stem this flow by sending warnings to other parts of the country notifying workers that there are more men than jobs in Detroit. Mr. Ford's new scale is said to be the cause of considerable adverse comment in manufacturing circles and it is rumored that an attempt may be made to file a protest with the Department of Labor at Washington.

Inasmuch as practically every business in the city was on one side or the other of the recent Ford-Newberry Senatorial fight, it is hinted that politics is playing an important part in the affair.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

O'Bannon Acquires Taunton Oil Cloth

NEW YORK, Jan. 13—The O'Bannon Corp. has acquired the Taunton Oil Cloth Co., Taunton, Mass. The Taunton Oil Cloth Co. is an old established concern that has had its products on the market for more than sixty years. It makes oil cloths. The plant will be run under the personal management of Nathan Newbury, treasurer of the Taunton concern.

Canadian Plant for Clyde

MONTREAL, Jan. 13.—Clyde Cars Co. of Canada has opened a Canadian plant for the assembling and distribution of Clydesdale trucks for Canada and the Imperial Colonies. It is at 73-81 St. Paul Street, Toronto. Clydesdale trucks are constructed in accordance with the subsidy scheme specifications of the British War Office.

Detroit Office for Roller-Smith

NEW YORK, Jan. 13—The Roller-Smith Co. has opened a Detroit office in the new Telegraph Building. It is in charge of C. H. Nicholson, formerly connected with the Chicago office of the company.

Canadian Distributer for Moline Tractor

MOLINE, ILL., Jan. 13.—The Moline Plow Co. has contracted with the Willys-Overland, Toronto, for the distribution of Moline tractors and implements for the Dominion of Canada. Overland branch houses will carry a stock of repair parts.

Automotive Products Co. to Change Name

DETROIT, Jan. 9—Because two other accessory companies are doing business under a like name, papers have been filed to change the name of the Automotive Products Co., incorporated last week, to that of Autoware Corp.

Milwaukee to Unite Motor Trades

MILWAUKEE, WIS., Jan. 13—Plans which have for their purpose the amalgamation of all sections of the motor car and supply industry and trade of Milwaukee under the leadership of the Milwaukee Automobile Dealers, Inc., are being completed by a special committee created a short time ago, with Alfred Reeke as chairman. It is hoped to complete the organization so that it will be one of the results of the annual Milwaukee show, Jan. 24 to 30.

"Shelko" Accessories and Supplies

MADISON, Jan. 13—L. F. Schoelkopf, head of the L. F. Schoelkopf Co., distributer of the Ford in Dane County, has recently created a manufacturing and jobbing department in accessories and supplies, which is marketing a line of goods under the brand of "Shelko."

Dividends Declared

The Kelly-Springfield Tire Co., $1 quarterly, common.

Nash Motors Co., $10 a share, common.

Temporary Receivership for Interstate Tractor Co.

WATERLOO, Jan. 14—The Interstate Tractor Co. has been placed in the hands of receivers. The court appointed as receivers Floyd L. Chamberlain, president of the Chamberlain Machine Works, and Howard S. Miller of the Cedar River Sand & Gravel Co. The receivership is considered a temporary one and the first step toward reorganizing, with the object of continuing the business. The company is held to be solvent with gross assets of approximately $2,000,000.

More Capital for General Tire

AKRON, Jan. 13—The General Tire & Rubber Co. has increased its capital stock from $1,000,000 to $2,500,000. The following officers have been re-elected: President, M. O'Neil; vice-president, W. O'Neil; secretary, W. E. Fouse; treasurer, Charles Herberich; directors, the officers and T. F. O'Neil, G. F. Burkhardt, W. L. Beckley and J. A. Diebolt.

Manitowoc Plating Will Add

MANITOWOC, WIS., Jan. 13—The Manitowoc Plating Works, Manitowoc, Wis., is contemplating the erection and equipment of additions costing about $15,000 early next spring. W. J. Wachowitz is manager.

Highway Trailer Co. 1918 Financial Report

EDGERTON, WIS., Jan. 13—The Highway Trailer Co., at its annual stockholders' meeting, reported unfilled orders in excess of $105,000, while its 1918 business amounted to more than $500,000, consisting largely of Government contracts for special military trailers. The balance sheet showed assets of $222,000, including enlargements and improvements costing $25,000 made during the past year. A total of $49,279.60 was paid for salaries and wages. An interesting item is the disbursement of $14,879.80 for express and freight. The company declared a 7 per cent dividend on a capital of $179,000, payable Feb. 1. President James W. Menhall and other officers and directors were re-elected.

George Wurtz, for several years general Wisconsin traveling representative of the mechanical goods department of the Diamond division of the B. F. Goodrich Co., Akron, O., has been promoted Eastern manager of the same department, with headquarters in Pittsburgh.

Acme Adds to Personnel

CADILLAC, MICH., Jan. 13—The Acme Motor Truck Co. has made the following additions and changes in its organization. H. L. Browne has joined the sales force, and will act as factory representative in Colorado, Wyoming, New Mexico and Utah. He was formerly connected with the Service Motor Car Co. J. E. Bowles, who, for the past year has been special representative in the middle western states, will be transferred to the Pacific Coast, with headquarters at San Francisco, commencing at once. George P. Gould will act as factory representative in Maine, Massachusetts, New Hampshire and Vermont.

New Machine Tool Company for Green Bay

GREEN BAY, Jan. 13—The Conradson Machine Tool Co. has been organized at Green Bay, Wis., with a capital stock of $300,000 to manufacture turret lathes and other machine tools.

Klumb Engine & Machine Co. Dissolved

SHEBOYGAN, WIS., Jan. 13—The Klumb Engine & Machine Co., which disposed of its plant and equipment some time ago, has discontinued business and the corporation has been dissolved.

Ford to Use Power Dams

DETROIT, Jan. 13—The Henry Ford interests have secured options on nearly all power dam locations on Rouge River from Dearborn to Northville. There are three power dams at Northville, three between Northville and Plymouth, one at Plymouth, one at Newberg and one at Nankin. Utilization of all power of nine or ten dams is contemplated, it is said.

Ford Branch Managers Meet

DETROIT, Jan. 13—Branch managers of the Ford Motor Car Co. were in annual convention here Jan. 7 to 11. Practically every sales district in the United States and South America was represented. Managers were unanimous in declaring the 1919 business outlook was unusually promising, and a number predict that the end of the season will see all previous sales records shattered.

The following branch managers were present:

R. S. Abbott, Atlanta; W. C. Anderson, Chicago; O. L. Arnold, Pittsburgh; L. C. Block, Philadelphia; H. M. Buckley, Fargo, N. D.; J. A. Deignan, Oklahoma City; H. C. Ethridge, Jacksonville; A. W. Gilpin, Milwaukee; C. L. Gould, Omaha; B. L. Graves, Los Angeles; E. H. Hampton, Buenos Aires, Argentine, S. A.; J. A. Handin, Salt Lake City; J. J. Harrington, Boston; Charles J. Hendy, Denver; C. C. Hildebrand, Minneapolis; Joseph W. Holt, Charlotte, N. C.; R. P. Jones, Washington; J. S. Keown, Louisville; A. J. Langford, Dallas; J. B. Lund, San Francisco; W. M. MacDonald, Houston; F. E. McClure, Cleveland; W. S. McNamara, Portland, Ore.; P. F. Minnock, Des Moines; H. K. Munroe, New Orleans; R. S. Neeley, New York City; G. C. Nichols, Cincinnati; Gaston Plantiff, Long Island City; R. P. Rice, Kansas City; E. L. Rockelman, Seattle; N. J. Schmucker, Jr., Scranton; G. B. Tyler, Buffalo; N. Udell, Indianapolis; C. S. Williams, Memphis; J. J. Wright, St. Louis.

Calendar

ENGINEERING

S. A. E. Meetings

Feb. 4-6—New York. Winter Meeting. Society of Automotive Engineers, Engineering Societies' Building.

Feb. 6—Victory Dinner, Hotel Astor, New York.

Feb. 5—Minneapolis Section, S. A. E. — Hotel Radisson. "Radiator Cooling Fans."

March 5 — Minneapolis Section, S. A. E.—Hotel Radisson, "Tractor Service and Sales."

April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

MOTOR SHOWS

Jan. 11-18—Los Angeles, Cal. Automotive Exposition.

Jan. 15-18 — Spokane, Wash. Progressive Automotive Show in dealers' salesrooms. Auspices of Spokane Automobile Chamber of Commerce.

Jan. 16-18—Dallas, Tex. First Annual Mid-Winter, Adolphus Hotel Annex. Dr. W. G. Langley, Manager.

Jan. 20-25 — Shreveport, La. Shreveport Automobile Dealers' Assn. Henry B. Marks, Manager.

Jan. 20-25 — Hartford, Conn. Broad Street Armory, Auspices of Agricultural Interests.

Jan. 24-30 — Milwaukee, Wis. Eleventh Annual, Milwaukee Automobile Dealers, Inc., Auditorium. Bart J. Ruddle, Manager.

Jan. 25-Feb. 1—Chicago. Passenger cars, Coliseum.

Feb. 1-15—New York. Automobile Dealers' Assn. Charles A. Stewart Manager, Hotel Woodward, Broadway and 55th St.

Feb. 3-6 — Chicago. Trucks, Coliseum.

Feb. 5-8—Fargo, N. D. North Dakota Automobile Dealers' Assn., Auditorium.

Feb. 10-15—San Francisco, Cal. Third Annual Pacific Automobile Show, Motor Car Dealers' Assn. of San Francisco. Exposition Auditorium. G. A. Wahlgreen, Manager.

Feb. 10-15—Rochester, N. Y. Rochester Automobile Trades Assn., Exposition Park. George C. Donahue, Manager.

Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.

Feb. 15-22 — Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.

Feb. 15-22—Albany, N. Y. Albany Automobile Dealers' Assn. State Armory.

Feb. 17-22—St. Louis. St. Louis Auto Mnfrs. & Dealers' Assn. Robert E. Lee, Manager.

Feb. 17 - 22 — Louisville, Ky. Louisville Auto Dealers' Assn.

Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.

Feb. 17-22 — Pittsfield, Mass. Pittsfield Automobile Dealers' Assn., State Armory. James J. Callahan, Manager.

Feb. 17-22 — Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.

Feb. 17-22—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

Feb. 18-22—Baltimore, Md. Baltimore Automobile Dealers' Assn. and Automobile Club of Maryland, Fifth Regiment Armory. H. M. Lucius, General Manager.

Feb. 22-Mar. 1—Hartford, Conn. Hartford Automobile Dealers' Assn., Inc., Broad Street Armory. Ben F. Smith, Manager.

Feb. 23-March 1—Cedar Rapids. Auditorium, Automobile Dealers' Assn.

Feb. 24-March 1—Kansas City, Mo.—Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

Feb. 24-Mar. 1 — Springfield, Mass. Automobile Dealers' Assn. Harry W. Stacy, Manager.

Feb. 24-Mar. 1—Portland, Ore. Ninth Annual, Dealers' Motor Car Assn., Auditorium. M. O. Wilkins, Manager.

Feb. 27-March 6—New York Aircraft Exhibition by Aircraft Manufacturers' Association, Madison Square Garden.

March — Scranton, Pa. Thirteenth Regiment Armory, Scranton Automobile Assn.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrandt, Manager.

March — Great Falls, Mont.—Montana Automobile Distributers' Assn.

March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.

March 1-8—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.

March 3-8—Columbus, O. Columbus Automobile Show Co., Memorial Building. W. W. Freeman, Manager.

March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.

Mar. 5-8—Quincy, Ill. Quincy Automobile Trades Assn., Armory.

Mar. 10-15—Paterson, N. J. Paterson Automobile Trade Assn., Fifth Regiment Armory. H. MacGinley, Show Manager.

March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

Mar. 10-15—Omaha, Neb. Fourteenth Annual, Omaha Automobile Trade Assn., Auditorium. Clarke G. Powell, Manager.

Mar. 12-19—St. Joseph, Mo. Sixth Annual, St. Joseph Automobile Dealers' Assn.

March 15-22 — Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.

Mar. 15-22 — Harrisburg, Pa. Harrisburg Motor Dealers' Assn., Overland Warehouse. J. Clyde Myton, Manager.

Mar. 22-29—Pittsburgh Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.

Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.

April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.

TRACTOR SHOWS

Jan. 20-25 — Hartford, Conn. Broad Street Armory.

Feb. 24-Mar. 1—Kansas City, Mo. Fourth Annual Tractor Show, Sweeney Building, Kansas City Tractor Club. Guy H. Hall, Sec.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show, Wichita Tractor and Thresher Club. Forum.

CONVENTIONS

Feb. 4-6—New York. Meeting Society Automotive Engineers.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

Lober Mfg. Co. Enlarges

TOLEDO, Jan. 9—The Lober Radiator & Mfg. Co. has been incorporated with a capital stock of $50,000 to take over the Lober Art Brass & Specialty Co. The present plant is to be enlarged and 5000 ft. of floor space and 100 employees added. The concern made airplane radiators during the war.

Motor Vehicle for Every 18 Persons

(*Continued from page* 102)

For four years, Iowa has held first place. She started out after a record in 1915 by registering a motor vehicle for every 16 persons and each year this has been consistently bettered. In 1916 it was 13, and Nebraska tied the record. Prior to 1916, California was the leader, having a motor vehicle for every 27 in 1912 and for every 19 in 1914. Nebraska took first place in the year between, 1915, registering a vehicle for every 25 persons. It is hardly fair to give the place that year to the District of Columbia, which had a vehicle for every 21 persons.

Last year there was one motor vehicle for every 20 persons in the United States.

Two years ago, only five states boasted registering more than 200,000 cars each. Last year eight states went over this figure. This year there are ten states well over 200,000 and one more that has nearly reached this total. Two years ago, not a single state had reached the 300,000 mark; even New York was well below it. Last year, New York, Illinois, Ohio and Pennsylvania topped 300,000. This year Iowa went into the 300,000 class and two states, New York and Ohio, graduated out of it into the 400,000 class.

To-day, eighteen of the forty-nine states and territories can count their motor vehicles in figures of six digits, which is two states more than last year.

Three National Tool Transmissions

ST. LOUIS, Jan. 9—The National Tool & Mfg. Co., is now building three new models of automobile transmissions, designed for small, medium, and heavy types of passenger cars.

Simpson Now Victory Truck

ST. JOSEPH, MO., Jan. 13—The Simpson Truck Co. has changed its name to the Victory Truck Co., and has increased its capital stock from $50,000 to $100,000.

Starkweather-Snook Open Chicago Office

FORT MADISON, IOWA, Jan. 13—The Starkweather-Snook Corp., manufacturer of the S. & S. shock absorbers, has opened a branch office and warehouse at 1402 South Michigan Avenue, Chicago, with Chas. Snook in charge. The main office and factory will continue at Fort Madison and the Chicago branch will carry a complete stock.

Torbensen Axle Co. Erects New Building

CLEVELAND, Jan. 15—The Torbensen Axle Co. have started work on a new two-story brick, steel and mill constructed building, 100 x 140, as an addition to its present buildings, to cost about $75,000. Completion of the building is scheduled within 45 days.

Still Higher Standards Are Needed

If America Is to Compete Successfully for World Trade She Must First Set Up the Mark of Quality

IT IS TIME TO BUILD FOR A PERMANENT BUSINESS

Constructive, Institutional Establishments Must Replace Those of Transient and Short-Lived Dividend Production

By H. M. Swetland
President United Publishers Corp.

THERE are many lessons which the American manufacturer can learn from Europe, particularly from England.

The war has performed a great service to both England and France in forcing them into production on a scale which classes their manufacturers among the great quantity producers of the world.

They have learned to use automatic machinery and progressive assembly and the utility of unskilled labor for all routine operations.

Manufacturing plants have been doubled and quadrupled in size and equipment, with modern and permanent construction and facilities for labor saving and maximum production, and the number of employees has been correspondingly increased, ranging from five to forty thousand in automotive, shipbuilding and general munition plants.

This enormous pro-

Mr. Swetland, who is also President of the Class Journal Co., on January 2 returned from Europe, where he traveled extensively through England, Scotland and France as a member of a party of American business paper representatives who were the guests of the British Government. The party was afforded unusual opportunity of investigating social environment, industrial activities and matters pertaining to war

ductive capacity, well organized and fully equipped, will rapidly evolve from the production of munitions and instruments of war into the manufacture of the necessary and luxurious commodities of life.

Further, the British Government during her later war period has fostered the reconstruction of her industries, *and the automotive manufacturer is in some instances well in advance of reconstructed production.*

Some Post-War Models Ready

For example—The Rolls-Royce plant has its product fully determined. It will build two cars—one a large car of practically the same character as the present model, to which will be added a small car, a four-seater with a smaller engine, which will have the Rolls-Royce character in materials and workmanship, but will have less capacity.

The Austin car, which is fully designed and ready for the market, presents many points of interest. In the first place, it has a very artistic and well-finished design. You have to look for the top. It disappears in a little pocket back of the rear seats covered with a narrow leather apron, and is entirely unobservable unless you look for it. This, of course, also protects the top.

Specialized Refinement in Design

This pocket keeps the top clean and dry and renders it easily available in case of emergency. Then the seating is an entirely new feature. There are four seats, two in front and two in the rear, which are adjustable to the passenger, both in height and in the inclination of the back. The back of the seat is high, having a projecting roll at the top which is fitted to the passenger, making a thoroughly comfortable seat for a long journey.

While the design of the car at the rear gives no evidence whatever of a compartment for tires, the entire back opens into a rear door, which discloses a compartment which carries two tires, tubes, tire tools and everything necessary for quick repairs. It is a thoroughly concealed compartment which is not observable as you look the car over.

The complete housing of top and spare tires permits an exterior entirely unmarred by protuberances.

These illustrate some of the points of superiority in design referred to.

Substantial Methods Inherited

Nothing short of a close personal investigation will give the correct impression of the strength and solidity of a British or Continental enterprise.

They seem to have formed the habit or to have inherited the idea of doing things in a strong, substantial way, and the result is that their enterprises run through from generation to generation, improving with each decade in strength and solidity of purpose.

It is at least an English trait of character, evidenced in their architecture of both public and private buildings, their shipping, and the full line of manufactured products. *They construct for durability and have not neglected design.*

Take one look at their locomotive. It is a finished product of harmonious design and utility not to be seen in the same product of any other country.

England Looking to World Markets

If England has learned quantity production, if she builds for quality and durability, if she is sensitive to design and finished product, with her great munition factories yawning for production, is it not fair to assume that she is looking with confidence to the markets of the world?

This is the day of reconstruction.

With all due respect to the quality of American products, which, in many instances, equal or excel those of any other country, if America is to compete for the markets of the world, these conditions of foreign production must have serious consideration.

We Must Develop QUALITY

Has not the time arrived when the American manufacturer should set up first the mark of high quality?

Should not the manufacturer take more pride in the quality of his product and the service which it renders to the world than in

the number of dollars that can be squeezed out of it?

It seems to be all a question of the ultimate desire back of the manufacturer.

If the most important point is the production of large profits and quick dividends then it is perhaps wise to turn out a product which will pass muster in the salesroom, get the check and let the consumer worry about the quality.

Adequate Inspection Vital

But if the desire is a permanent business, well established, with satisfaction to manufacturer, merchant and consumer, then it is time to produce the greatest possible quality, using substantial and well-tried materials, coupled with workmanship adequate to the conditions, followed by an inspection which really *inspects and rejects all imperfections.*

The matter of inspection and rejection needs the attention of the manufacturer in our automotive industry. Too many glaring imperfections are passed along to the consumer.

These things should be coupled still further with the European idea—particularly in France—of combining excellent workmanship and good materials with artistic design.

More criticism of the Liberty engine was offered among the great manufacturers of England because of its design and general appearance and finish than on the performance of the product on which America spent so many millions.

Reconstruction is at hand.

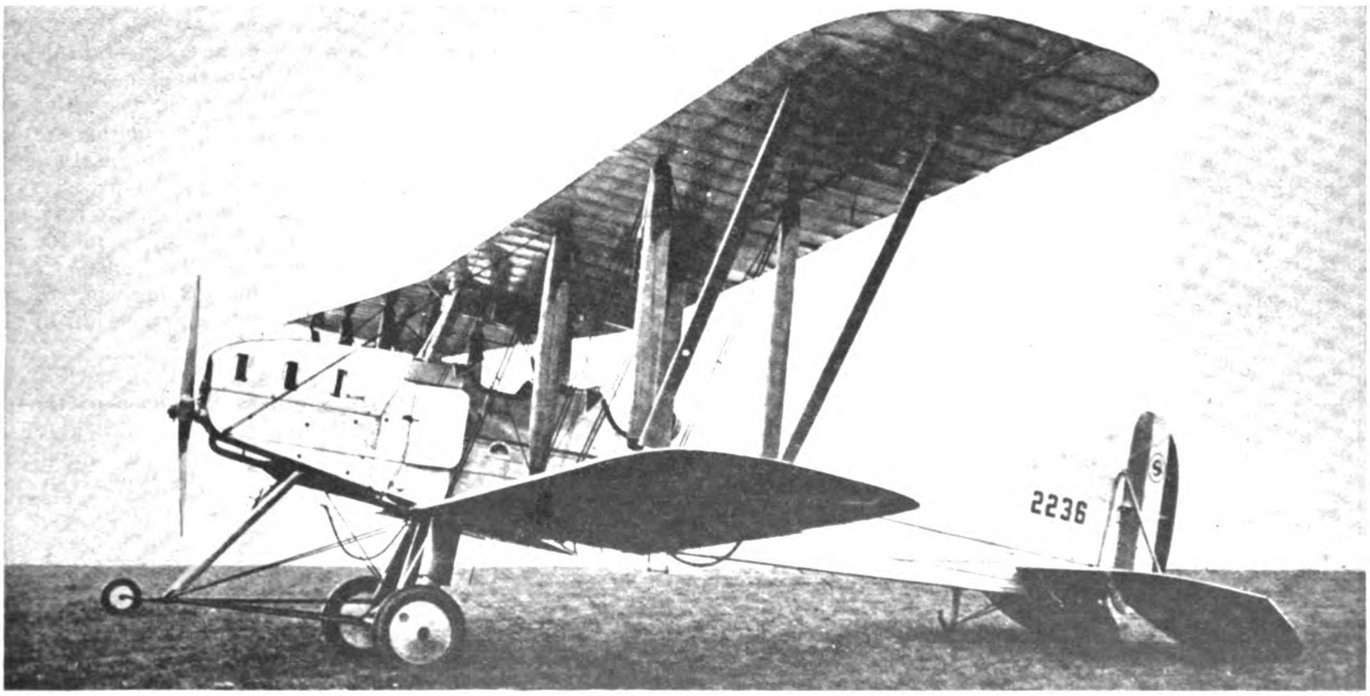
The world is entering on new conditions.

The question of the adjustment of labor and capital, as well as the question of raw materials, transportation and matters of legislation, is to receive a severe shake-up in the next ten years.

It is time to build for a permanent business.

American manufacturing enterprise must now evolve from transient and short-lived dividend production to an institutional, permanent and constructive establishment which will outlive its progenitors and establish the solidity of American industry in the future markets of the world.

R. E. 7 (Reconnaissance Experimental) Biplane



This machine was built at the Royal Aircraft factory and was used as a self-protecting artillery observation machine, night bomber and contact patrol machine. It is fitted with a 138-hp. R. A. F. 12-cylinder engine

Radiator Cooling Fans

The Fan the Controlling Factor in Any Cooling System—Fan Design, Mounting and Drive—Advantages of Fan Housings—Proper Location of Fan Relative to Housing

By Louis Schwitzer*

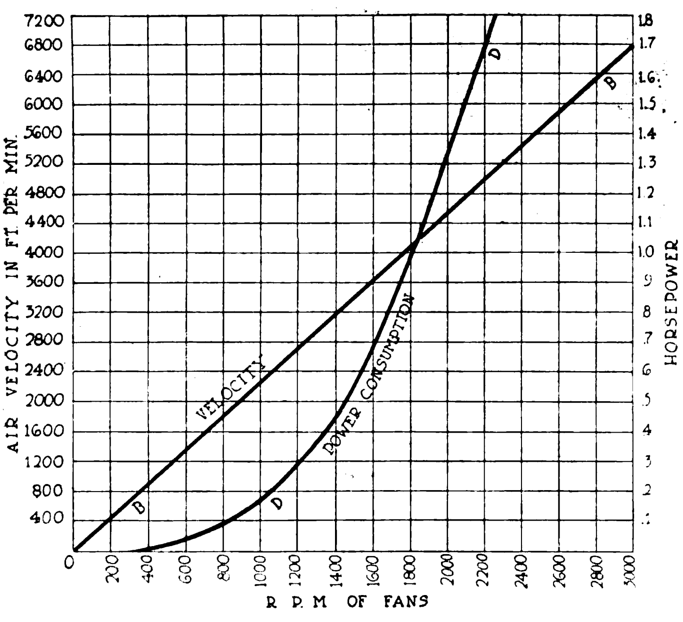
THE problem of cooling, in all water cooled road vehicles, resolves itself into a question of how much air can be passed through the radiator. Researches have shown that when other conditions are reduced to uniformity, the heat dispersal varies directly with the quantity of air drawn through the radiator. Therefore, the fan is the governing factor in cooling, and the determination of its correct type and its installation are of utmost importance. The fundamental condition of effective cooling is that a perfect balance has to be maintained between the heat units carried from the engine into the cooling water and radiator and the heat units disposed of by the radiator to the air passing through it. Expressed in the form of an equation,

B.t.u. imparted to cooling water = B.t.u. imparted to air.

To raise the temperature of 1 lb. of air 1 deg. Fahr., 0.2375 B.t.u. is necessary. The B.t.u. imparted to the cooling water can be determined from the horsepower output of the engine and its fuel consumption per horsepower hour. It is obvious from the above equation that with any given temperature rise a sufficient amount of air must be drawn through the radiator by the fan to secure a heat balance, from which we derive that

B.t.u. per minute imparted to cooling water
= Air volume × specific weight of air × 0.2375 × temperature rise of air.

*President Automotive Parts Co., Indianapolis, Ind.



Speed-horsepower and speed-air velocity curves of fan

The B.t.u. per minute imparted to the cooling water in different types of engines may be taken at the following figures, which are sufficiently accurate for all practical purposes:

80 B.t.u. p. hp. per min. for overhead valve engines
100 B.t.u. p. hp. per min. for L-head engines
110 B.t.u. p. hp. per min. for T-head engines

The specific weight of the air can be taken as 0.071 lb. per cubic foot at 100 deg. Fahr. The question of the temperature rise of the air upon its passage through the radiator has been thoroughly treated by Mr. Modine of the Modine Mfg. Co., in his S. A. E. paper of last January. Reference is there made to the physical laws that the amount of heat given off is proportional to the difference in temperature between the radiating body and the air, and that the loss of heat by convection is nearly proportional to the difference in temperature between the hot body and the air. These laws indicate that we are interested in maintaining the surface of the radiator at as high an average temperature as is practical. A temperature rise of 25 or 30 deg. is well within the practical limit, and these figures may be used in the discussion here.

Limitation of Frontal Area

The air volume is a function of the open frontal area of the radiator, in square feet, and the air velocity in feet per minute. These are the two variables which determine the efficiency and economy of a cooling system. The frontal area is limited by construction details, such as width of frame, height of bonnet, etc., and cost. The size can be determined from the above equation after a consideration of these construction details and the assumption of a certain air velocity. The open frontal area varies between 75 per cent and 83 per cent of the total frontal area, depending on the construction of the radiator core.

If, then, from the above equation with a certain assumed air velocity, the required frontal area of the radiator is determined, it is necessary to design a fan to give this air velocity under conditions of maximum economy. Large diameter fans with comparatively low speeds will be selected.

The power required for operating fans increases very rapidly with the speed of revolution and all out of proportion with the relatively small increase in air velocity or volume. At the left is a typical air velocity and horsepower chart which shows this condition clearly.

A large fan will deliver the same volume of air at a lower speed than a smaller fan and use considerably less horsepower. For instance, to deliver 7000 cu. ft. of air per minute requires 2 hp. with an 18-in. fan, 1.4 hp. with

a 20-in. fan and only 1 hp. when a 22-in. fan is used.

After a fan of the proper diameter and type has been selected that will deliver the largest volume of air with regard to the horsepower and the necessary and desirable radiator frontal area, its proper installation must be considered.

With slow moving vehicles, such as trucks and tractors, where the initial air velocity due to the vehicular motion is negligible, fan housings should be employed to insure not only the most uniform air velocity through the radiator but also the maximum efficiency of the fan. To be able to use the largest diameter fan with a given frontal area this area should be as nearly as possible in the form of a square. This will allow of a simple and efficient fan housing.

The fan housing must be designed so that the fan will be entirely inside of it. Tests have proven that with a fan partly inside and partly outside the housing, the air velocity drops about 10 per cent and the horsepower required is increased 20 per cent, as against running the fan entirely inside the housing.

Below are the data of a test made with a 23-in. fan at different speeds, the fan being located first entirely inside the housing, and then half inside and half outside. The fan was directly coupled to the shaft of the dynamometer, to eliminate any slippage, and the radiator was mounted on a slide, so that observations could be made for different positions of the fan relative to the radiator housing.

RESULTS OF TESTS TO DETERMINE BEST POSITION OF FAN RELATIVE TO HOUSING

Test No.	Distance of fan from radiator core	Relation of fan to housing	R.p.m. of fan	Hp. required	Average air speed ft. per m.	Average air speed per hp. ft. per m.
1a	3 in.	½ in. inside	1000	0.572	1449	2535
1b	4⅝ in.	Half out	1000	0.666	1305	1960
2a	3 in.	½ in. inside	1200	0.915	1692	1850
2b	4⅝ in.	Half out	1200	1.06	1497	1402
3a	3 in.	½ in. inside	1400	1.43	2142	1500
3b	4⅝ in.	Half out	1400	1.73	1803	1043

The fan housing must be deep to prevent sharp angles at the radiator corners, and the fan itself should not be too close to the rear face of the radiator core. There is no fixed rule for calculating the most efficient distance of the fan from the core, but tests should be made in each case to determine it. However, it will be found that when the diameter of the fan is practically equal to the width and height of the radiator core, there is little difference in the effects with this distance anywhere between 2 and 3 in. Fans of small diameter relative to the size of the core should be further from it, to be able to draw air through the corners and give a uniform air velocity through the total frontal area of the radiator. The opening in the fan housing should be such that the distance between the tip of the fan blade and the edge of the housing does not exceed 1½ in., to prevent back drafts. Preferably the outer tip of the blade should be ¼ in. from the edge of the housing toward which the fan blade moves when the belt is tightened and 1½ in. from the opposite side. This gives an opening 1¾ in. larger in diameter than the fan. Direct gear or chain driven fans can, of course, be arranged in the center of the opening of the housing.

In passenger cars, where no housings are used, care should be taken that the fan is not brought too close to the radiator, as this contributes considerably to air noise. No fan housings are necessary, as the initial air velocities are great, and with the small amount of space available underneath the bonnet the housings would have to have such flat corners that they would be more a detriment than an advantage, on account of back draft around these corners.

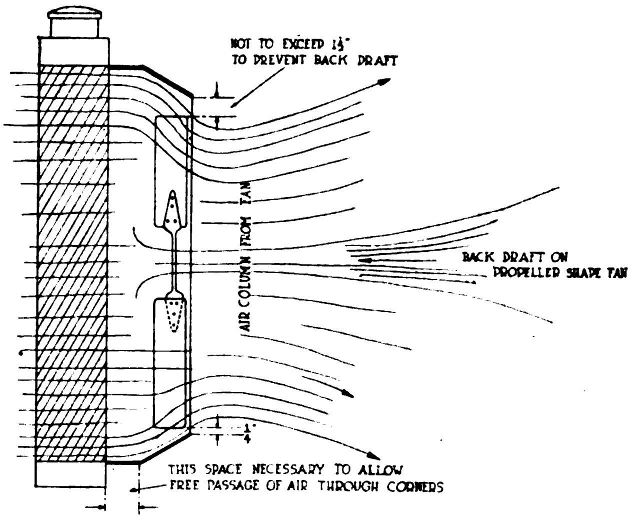


Diagram of fan housing

When designing a housing it is worth while to note the shape of the air column away from the fan. Contrary to common belief, there is no centrifugal discharge of air from the fan, but the air currents assume a hyperbolical shape, as shown in the illustration. This is due to the reverse current around the fan axis. With straight bladed fans this is not as pronounced as with propeller shape blades. On tests with the latter, back drafts have been measured behind the fan as high as 100 ft. per minute, forming a cone toward the center of the fan.

In order to obtain a positive air current through the radiator and to avoid back drafts, more importance should be paid—particularly in passenger cars and trucks—to the air outlet underneath the bonnet. The air expands a great deal under the hood, and with an inadequate outlet a static pressure is built up which seriously interferes with the capacity of the fan and relieves itself by backing out through the radiator. There should be at least 20 per cent more outlet area under the bonnet than the total open area through the radiator. Dust shields between the frame and the engine should not close up tight against the flywheel housing, particularly if the space between the toeboards and the crankcase is restricted, as is the case on most cars. A liberal opening should be left by inclining the dust shields toward the rear or putting louvres in. Many a case of serious heating trouble has been cured by providing ample openings in the dust shields or under-pans.

A good size opening through the under-pan or dust shields on both sides of the engine underneath the dash is much more effective than the louvres in the bonnet, as the motion of the vehicle (particularly of passenger cars) produces an injector action on the air under the bonnet which assists materially in the disposal of the hot air.

If louvres are cut in the bonnet, care must be taken not to get them too close to the radiator, as this would allow the fan to suck air through them, and naturally this would detract from the amount of air going through the radiator and reduce the cooling efficiency. By tests on various vehicles it has been observed that if the first louvre is placed 10 in. from the radiator there will be no negative drafts through it.

A proper size fan and housing will be useless unless means are provided to drive the fan and drive it efficiently for long periods. Therefore, the driving mechanism for the fan deserves serious consideration. Ample width and size of belts and large diameter pulleys must

be used. Sufficient belt contact must be provided to transmit the horsepower necessary to drive the fan positively without slippage and frequent adjustments even with the belt somewhat slack. No pulleys of less than 3-in. diameter should be employed on the fan, and, if flat belts are used, 1¼ in. should be the minimum width for any size of fan. With V belts, according to Graton & Knight, a 28-deg. angle is the most efficient, and a width of ⅝ in. at the top is the least to be employed. Manual belt adjustments have proved more successful than automatic take-ups. These latter give trouble due to spring breakage and undue vibration of the fan. There have been some successful automatic take-ups, but their cost is in most cases prohibitive for ordinary automotive road vehicles.

The fan as a whole should be given the same careful consideration as any other part of the tractor. Pressed steel fans are used most frequently, and are the strongest and lightest for a given diameter. The spiders and blades must be made from a good quality steel, strong enough to withstand the centrifugal stresses, rigid enough to prevent vibration, and perfectly balanced. The curve and angle of the blades must be chosen to give a maximum air velocity with a minimum horsepower requirement. The blade assembly should be bolted and not riveted to the hub, to allow an easy exchange, as the blades frequently get damaged through interference.

Failure of Bearings Troublesome

Failure of fan bearings has been the cause of the most irritating trouble, and the use of the proper bearings is, therefore, of the highest importance. In fact, 90 per cent of the failures of fans are due to improper bearing installation.

In a cooling fan there is both a radial load and a thrust load. The radial load is due to three distinct causes:

First, the weight of the parts supported, including the hub, pulley, blade assembly, etc.

Second, the static tension in the belt.

Third, the belt pull which drives the fan.

The belt pull is the total pull of the tight and loose sides of the belt. The factors determining this pull and the methods of ascertaining its amount are discussed below.

The load produced by the weights of parts resting on the bearing is in most cases very small, varying from 3½ to 10 lb.

The personal equation enters into the adjustment of the fan belt, and consequently the load on the bearing resulting from the tension in this belt cannot be calculated, as it depends on how much force is used in tightening it. It has been found that even crowbars are used to tighten the belt, and this might easily bring the load up to several hundred pounds.

The belt pull is the resultant pull of the tight and loose sides of the belt, and can be figured from the following:

H = Horsepower transmitted
N = Speed of pulley in r.p.m.
R = Radius of pulley in inches.

The torque in lb.-in. is

$$T = \frac{63{,}025 \times H}{N}$$

and the tangential force in pounds on the rim of the pulley, or the effective belt pull, is:

$$P = \frac{T}{R}$$

P is equal to the difference between the tension T_1 in the tight side and the tension T_2 in the slack side of the belt—

$$P = T_1 - T_2$$

The tensions act approximately in the same direction and it is the sum of these tensions which produces the load on the bearings. Therefore, we must solve the formula

$$P_p = T_1 + T_2$$

and get the load produced by the belt pull.

Thrust Loads

On the other hand, the thrust load on the bearing is due to only one factor, namely, the pressure of the air column delivered by the fan. There have been many misconceptions about this thrust load. In ordinary fans, as used at present for radiator cooling, this load is practically negligible up to 30-in. diameter fans. It has been proved by calculation and actual tests to be less than one-twentieth of the radial load produced by a belt pull sufficient to transmit the torque. When considering the additional load put on by the belt adjustment and weight of the fan, the thrust load is still a smaller percentage of the radial load. The pressure per square foot is exerted by a moving air column

$$P_t = 5.2h$$

Where h is the velocity head in inches of water and V the velocity of air in feet per minute.

$$V = 4000 \times \sqrt{h}$$

or

$$h = \frac{V^2}{16{,}000{,}000}$$

and from this formula we can solve

$$P_t = 5.2 \times \frac{V^2}{16{,}000{,}000}$$

In a test a fan was mounted so as to float on a shaft in such a manner that the end thrust was registered directly on a scale. It was found that an 18-in. fan running at 1750 r.p.m. and producing an air velocity of 2000 ft. per minute showed an end thrust of 3.25 lb. This coincides quite closely with the calculation below:

$$P = \frac{5.2 \times 4{,}000{,}000}{16{,}000{,}000} = 1.3 \text{ lb. per square foot.}$$

In the case of an 18-in. diameter fan, which presents an area of 2.54 sq. ft.,

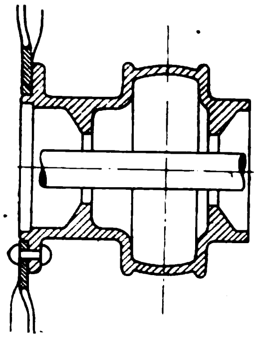
$$1.3 \times 2.54 = 3.3 \text{ lb.}$$

is the total pressure of the air column, or the total thrust load.

Affected by Initial Air Velocity

The end thrust also depends on the initial air velocity produced by the motion of fast-moving road vehicles. This air velocity will naturally tend to drive the fan and will reduce end thrust. At a certain speed the initial air velocity is equal to the one due to the fan, and the thrust loads will be balanced. At speeds above this the thrust will be reversed. This would indicate that on passenger cars there is the least necessity for provisions to take up thrust loads.

The foregoing shows that the radial load is the one that has to be taken care of in cooling fans, and that the thrust load is so small that it does not justify using a combination bearing. The small amount of thrust load is best taken care of by a plain thrust bearing, using a floating bronze washer between two hardened and ground steel surfaces. There is not sufficient pressure to squeeze the oil film out between the washers and the thrust will be carried on an oil film. This arrangement is simple and does not call for means of adjustment or extremely accurate machine work like ball thrust arrangements. The latter also do not stand any abuse or hard handling through the shops and in service, and require expert and careful assembling. Fan mountings equipped with flex-



Fan hub design which is wrong because it requires constant replenishing of the lubricant supply

ible roller and plain thrust bearings have been tested recently in a laboratory to the equivalent of 100,000 miles of automobile service without detrimental depreciation or failure of the thrust washers.

Cup and Cone Bearings

Cup and cone ball bearings have been widely used up to date, but their basic principles are wrong for most of our fan applications. It takes an expert to know when these bearings are properly adjusted, and when not in proper relation to each other they are noisy and deteriorate rapidly. If the bearings are too tight, undue strain is put on the already severely taxed surfaces, with the result that their life is materially shortened. A certain blow or shock at such a time causes indentation of the races and is apt to cause breakage. The slightest wear interferes with the proper action of the cup and cone bearing. Carrying a thrust load in addition to the radial load results in a considerable reduction of the radial load carrying capacity, which is the main load to be taken care of in cooling fans. The best practice is to let the bearings do one thing and do it well, rather than do two things indifferently. With bearings designed to carry one load only, we have none of these complications, hence their design and mounting conditions are simple. This includes annular ball, roller and plain bearings. If such bearings are properly built they will operate indefinitely. Their advantages for this kind of service are many and very quickly seen. If at any time the housing or mounting in which such bearings are operated is taken apart for any purpose, any novice can put it back again without any danger of mistake, for there is no adjustment involved.

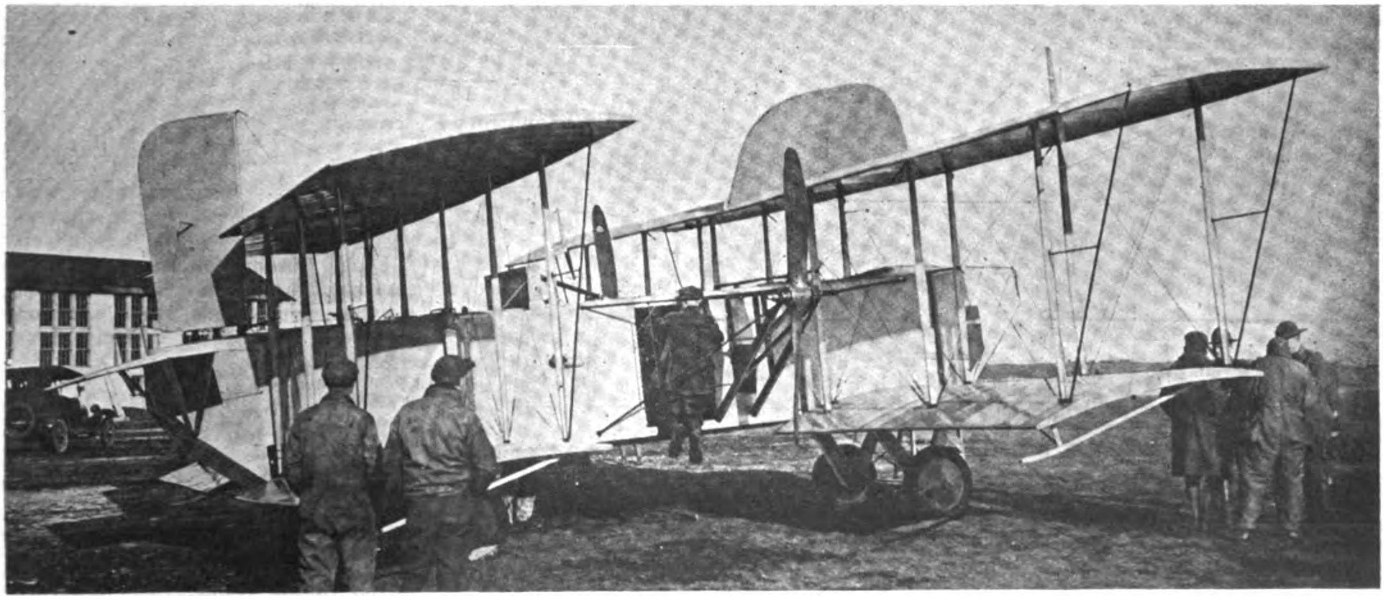
These bearings, it will thus be seen, cannot be adjusted too loosely, causing noise and poor alignment. Neither can they be adjusted too tightly, which would increase the strain on the operating surfaces, and which might even cause breakage in the case of excessive shock.

Hub Design

As none but fluid lubricant should be used for fans, the hub should be designed so that the oil will reach the bearings and not be held by circumferential force against the pulley rim. The bearings therefore should be the largest diameter in the inside of the hub. Designs like that illustrated by the sketch are wrong, as they require constant replenishing of the lubricant. The bearings would run dry even with the hub nearly half full of oil. Provision should be made to keep the dust out and the oil in. This can be done in a simple way by making the center of the fan blade spider solid, bolting it to the front flange of the hub and inserting into the rear a suitable felt retainer. Adjustable stuffing boxes have not proven successful. They are either too tight or too loose, as no care will be given them. When tight, they cause slippage of the belt and deterioration of same, excessive heating of the hub and spindle, scoring of the shaft and destruction of the felt; when loose and not properly locked they cause oil leakage and are being shaken off by the fan vibration. The fan shaft should be made of high-grade material and heat treated to obtain a high resistance against fatigue. The fan supports must be rigid, and rather too heavy than too light, to prevent vibration and breakage. Account should be taken of the fact that in most cases such breakage causes destruction of the radiator and necessitates expensive repairs.

Summarizing the foregoing, it has been shown that the fan is the most potent cooling factor, and the essential features of its design and operation are:

LARGE DIAMETER AND LOW SPEED.
PROPER DESIGN OF BLADES FOR MAXIMUM AIR EFFICIENCY WITH A MINIMUM HORSEPOWER.
WIDE BELT AND LARGE DIAMETER PULLEY.
RADIAL BEARINGS, OIL AND DUST TIGHT.
A SUITABLE FAN HOUSING ON SLOW-MOVING AUTOMOTIVE ROAD VEHICLES.



This new tandem plane recently made its initial flight at Mineola, Long Island. It is one of the regular twin-engine pusher machines, and has an additional set of wings attached to the fuselage

An Analysis of the Hotchkiss Drive*

Loads on Rear Springs the Resultant of Weight Carried and Torque or Brake Reaction—Spring Action Under Road Shock Reduced by Effect of Torque on Spring

By Otto M. Burkhardt

THE reaction of the torque transmitted to the driving wheels of a motor vehicle has a tendency to lift the front wheels off the ground. The torque necessary to raise the front wheels is

$$T \times R = W_f \times b$$

where

T = Tractive force at circumference of driving wheels in lb.
R = Radius of driving wheels in in.
W_f = Load on front wheels in lb.
b = Length of wheel base in in.

From the above equation we find that the force tending to lift the front wheels off the ground if a certain torque $T \times R$ is transmitted to the rear wheels may be expressed by

$$W_f = \frac{T \times R}{b}$$

Let W be the weight of a motor truck when loaded. The weights on the rear and front wheels then will be about ¾ W and ¼ W respectively. The tractive force of heavy commercial vehicles is generally smaller than $0.6 \times W_r$, but for passenger cars it is frequently larger. We may, therefore, take this as a practical average value. For a wheelbase of 8.4 times the radius of the driving wheels, we find that under the above given circumstances the force tending to lift the front wheels off the ground is:

$$W_f = \frac{T \times R}{b} = \frac{0.6 \times W_r}{8.4} = 0.0536\, W.$$

The latter amount is equal to 21½ per cent of the weight on the front wheels. As this phenomenon lends itself admirably for the determination of the tractive force, it was utilized in some well known experiments by Professor Riedler.

We may now with advantage apply our equations to a practical example, that of a 5-ton truck of 20,000 lb. spring-supported weight. Hence

$$W = 20{,}000 \text{ lb.}$$

*From a paper presented to the Buffalo Section of the S. A. E.

$$W_r = \frac{3\,W}{4} = 15{,}000 \text{ lb.}$$

$$W_f = \frac{W}{4} = 5000 \text{ lb.}$$

The truck is equipped with an engine developing 50 hp. at 1000 r.p.m. The total gear reduction is 50 to 1 in low gear, and the efficiency of the mechanism may be taken as 80 per cent. We obtain, therefore, a driving power reaction moment of

$$T \times R = \frac{50 \times 63024}{1000} \times 50 \times .8 = 126{,}000 \text{ lb.-in.}$$

With a 14 ft. = 168 in. wheelbase the force tending to raise the front axle is:

$$W'_f = \frac{126{,}000}{168} = 750 \text{ lb.}$$

The chassis shown in figure 2 is provided with a torque rod, which is provided to impart the wheel power reaction to the frame. As the torque rod is 50 in. long the pressure exerted at the end of the rod is

$$P' = \frac{126{,}000}{50} = 2520 \text{ lb.}$$

This pressure is comparatively small and easily taken care of.

As a single force cannot balance a couple, we must have another force equal and opposite to P' with its point of application in the center of the axle. The latter force, being the reaction of the former, has been denoted with P''. We shall now resolve the force P' into two components P'_f and P'_r with their points of application at the centers of the front and rear axles respectively. The former of the two components is what we have so far known as W'_f as we shall presently see. It is:

$$P'_f = \frac{P' \times 50}{168} = \frac{2520 \times 50}{168} = 750 \text{ lb.} = W'_f$$

$$P'_r = \frac{P' \times 118}{168} = \frac{2520 \times 118}{168} = 1770 \text{ lb.}$$

If we now subtract P'_r from P'' we obtain

$$P'' - P'_r = 2520 - 1770 = 750.$$

The force $P'' - P'_r$ is, therefore, also equal to W'_f, but acting in the opposite direction.

From this it follows that when the maximum torque is transmitted to the rear wheels, the loads on the rear and front wheels have changed to

$$W''_r = W_r + W'_f = 15{,}750 \text{ lb. and}$$
$$W''_f = W_f - W'_f = 4250 \text{ lb.}$$

Let us now take another torque rod of the same length as the one considered but extending from the rear axle equal distances in both directions and having both ends linked to the frame. The pressure on both ends of the torque rod will then be alike, *i. e.*, 2520 lb. If, how-

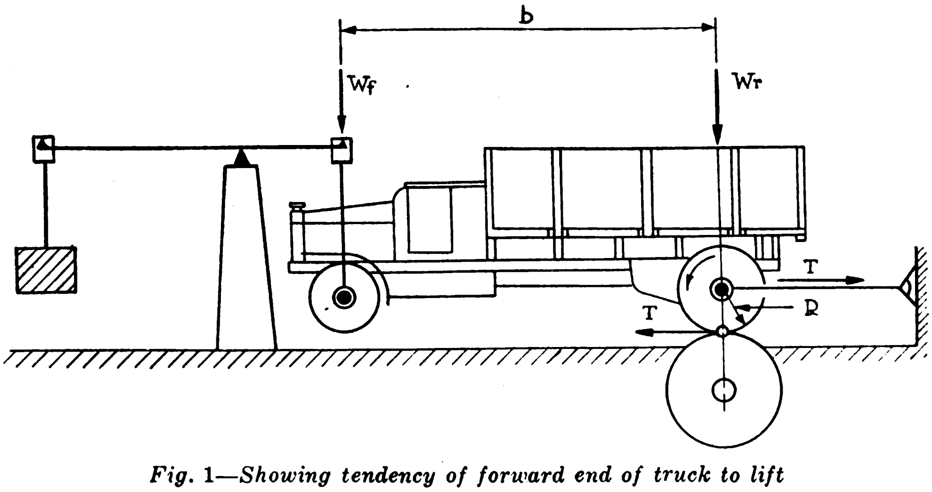


Fig. 1—*Showing tendency of forward end of truck to lift*

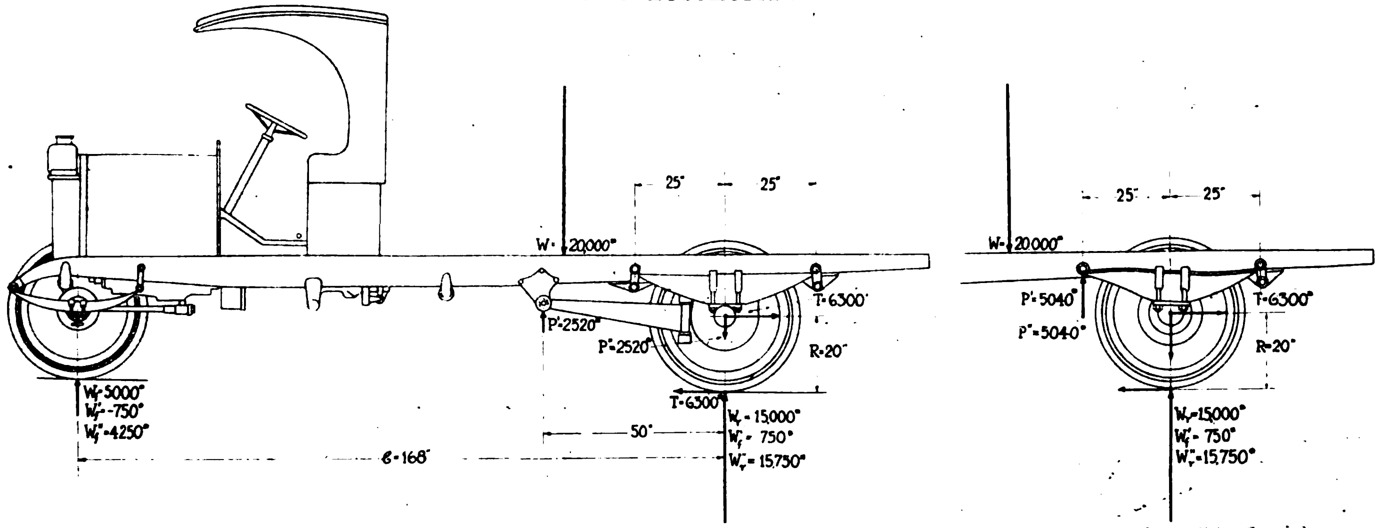

Figs. 2 and 3—Loads and reactions with ordinary and Hotchkiss drive trucks

ever, we substitute a rear spring for the torque rod all conditions are changed.

To prove our contention a chassis is shown in Fig. 3 in which the springs act as torque rods. With the same power and gear ratio we obtain the same loads as before on rear and front wheels,

$$W''_r = W_r + W'_f = 15{,}750 \text{ lb.}$$
$$W''_f = W_f - W'_f = 4250 \text{ lb.}$$

Now the whole system is in balance. The springs are centrally secured to the axle and each rear spring bolt must necessarily carry a load of

$$\frac{15{,}750}{4} = 3938 \text{ lb.}$$

The torque reaction is to be imparted to the chassis through the rear springs. As the springs are designed to take loads in one direction only it must be taken for granted that the two rear spring halves to the left of the axle center have to withstand the reaction of 126,000 lb.-in. If we assume the rear springs to be 50 in. long we have two half springs each 25 in. long to take this reaction. This means an extra load of

$$P' = \frac{126{,}000}{2 \times 25} = 2520 \text{ lb.}$$

on each of these spring bolts. It is absurd to think that the right hand halves of the rear springs could take part of this load because this would require a downward pull, whereas it is quite evident that the spring halves here under consideration cannot pull in one direction and at the same time push in opposite direction to support half of the load which is carried by either rear wheel.

In the chassis shown in Fig. 3, we have, therefore, one half of the rear spring loaded as before with

$$\frac{W''_r}{4} = \frac{15{,}750}{4} = 3938 \text{ lb.}$$

while the other half is loaded with $3938 + 2520 = 6458$ lb.

Every motor truck is provided with brakes. If they are in good condition and applied with some force it is generally possible to lock the rear wheels. This produces a moment of about

$$15{,}000 \times 0.6 \times 20 = 180{,}000 \text{ lb.-in.}$$

This braking power acts in a direction opposite to the driving power and its reaction also is opposite in direction to the driving torque reaction. That is, in the case of the Hotchkiss drive, Fig. 3, the rear instead of the front halves of the rear springs transmit the reaction to the chassis. We observe that the braking power is 43 per cent larger than the driving power. In determining this figure the load of which the rear wheels are relieved when the brakes are applied has been neglected because if chains are used the braking power may even be larger than here assumed.

Now in case of the chassis shown in Fig. 2 the rear springs are loaded less than ordinarily when the brakes are applied. However, in the chassis of Fig. 3 the load on the rear halves of the rear springs is much increased by the application of the brakes. Following the same reasoning as before we have:

$$W'_f = \frac{180{,}000}{168} = 1070 \text{ lb. and consequently}$$
$$W''_r = W_r - W'_f = 15{,}000 - 1070 = 13{,}930 \text{ lb.}$$
$$W''_f = W_f + W'_f = 5000 + 1070 = 6070 \text{ lb.}$$

Each of the rear halves of the rear springs receives an additional load

$$P' = \frac{180{,}000}{2 \times 25} = 3600 \text{ lb.}$$

These half springs are, therefore, loaded with $\frac{13{,}930}{4}$ $+ 3600 = 7083$ lb.

The minimum load ever carried by the rear wheels of either chassis may be taken as 6600 lb. (Vehicles running without load.) The minimum load per spring bolt is, therefore,

$$\frac{6600}{4} = 1650 \text{ lb.}$$

If the springs for both chassis are designed to deflect 4 in. under the maximum load, then if the vehicles are running with very little load the spring deflection in case of the chassis shown in Fig. 2 is

$$d_s = 4 \times \frac{1650}{3938} = 1.675$$

while in the case of the chassis shown in Fig. 3 the least deflection is

$$d_s = 4 \times \frac{1650}{7083} = .932.$$

The difference in the riding qualities of the two vehicles is, on this account, quite considerable. In fact, the latter vehicle if badly designed, may be entirely unsuitable for the transportation of light delicate goods.

Fig. 3 illustrates how unequally the springs deflect. This accounts for the well-known phenomenon that in most Hotchkiss drive trucks the brakes hold all right if applied gently but not if applied vigorously, or vice-versa. The trouble of loose spring clips so closely associated with the Hotchkiss drive is also well known. Furthermore, it is well known that the speed of the vehicle is dependent upon the suspension. A vehicle equipped with torque rod may, therefore, safely be operated at somewhat higher speed than one without this member.

So far, we have assumed that the reaction of the tractive force is a constant draw bar pull acting in the center of the rear axle. In practice the tractive force is generally utilized to accelerate the gross weight of the vehicle, to overcome road resistance or resistance due to gradients. During acceleration the reaction of the tractive force has its point of application in the center of gravity of the vehicle. When gradients are negotiated at a constant rate of speed or under other constant running conditions the reaction has its point of application in the front end of the radius rods if such are provided or in the front spring bolts in case of the Hotchkiss drive arrangement.

Now every engineer knows that the center of gravity of

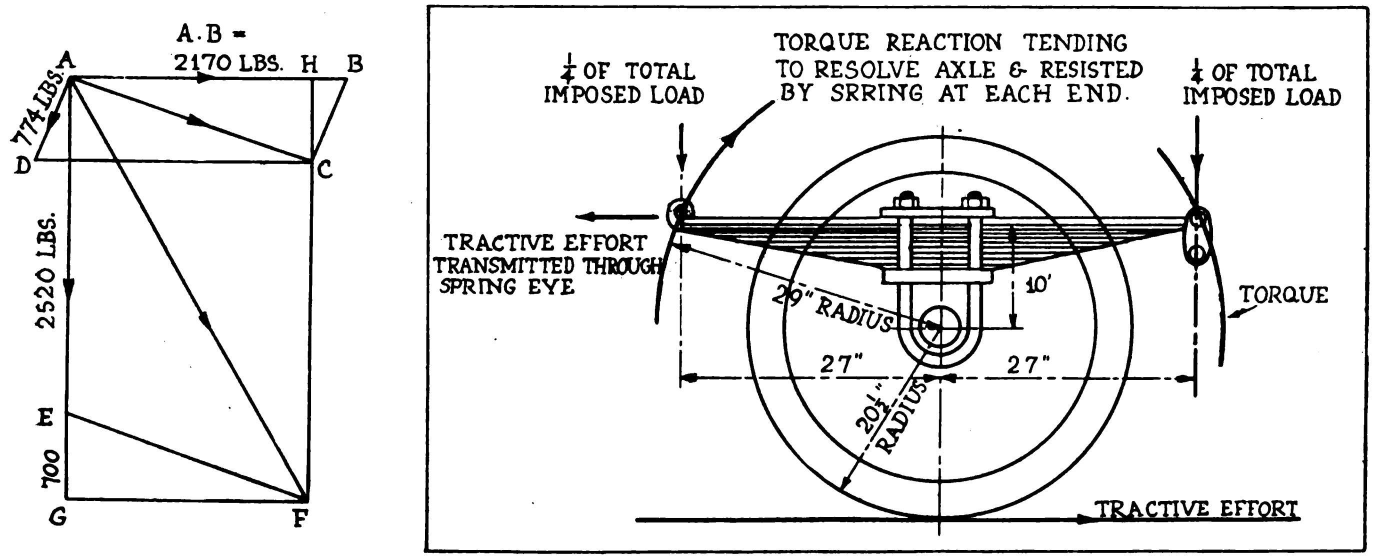

Fig. 4—Drawing revealing a misconception of the action of a Hotchkiss drive

a motor vehicle as well as the other points of reaction above mentioned are generally further from the ground than the center of the rear axle. Consequently in these cases we have to deal with a moment of much larger magnitude than those so far considered.

That such fundamental principles are being neglected is shown by Figs. 4 and 5, which are reproduced from leading trade papers. In connection with Fig. 4 the writer states that the torque reaction is resisted by the spring at each end. This we have proved to be an erroneous conception. Furthermore, we learn from the magnitude of the forces that the writer imagines the reaction of the tractive force to be acting in the center of the axle, whereas in reality it is acting through the top leaf of the spring. The writer shows it there but neglects it. This makes it appear advisable to place the spring way above the axle. Hardly anybody, and least of all the advocates of underslung spring design, can reconcile themselves with such a conclusion. This, however, is no reason and another hypothesis should be invented, because in an exact science like mathematics and mechanics there is no need for hypotheses. Nevertheless, we find in another article by a well known company that in its opinion a load acting vertically in the center of a perfectly symmetric spring can impose unequal loads on the spring bolts. Fig. 5 is reproduced from this article and speaks for itself, for it is all fiction, with not a bit of truth in it.

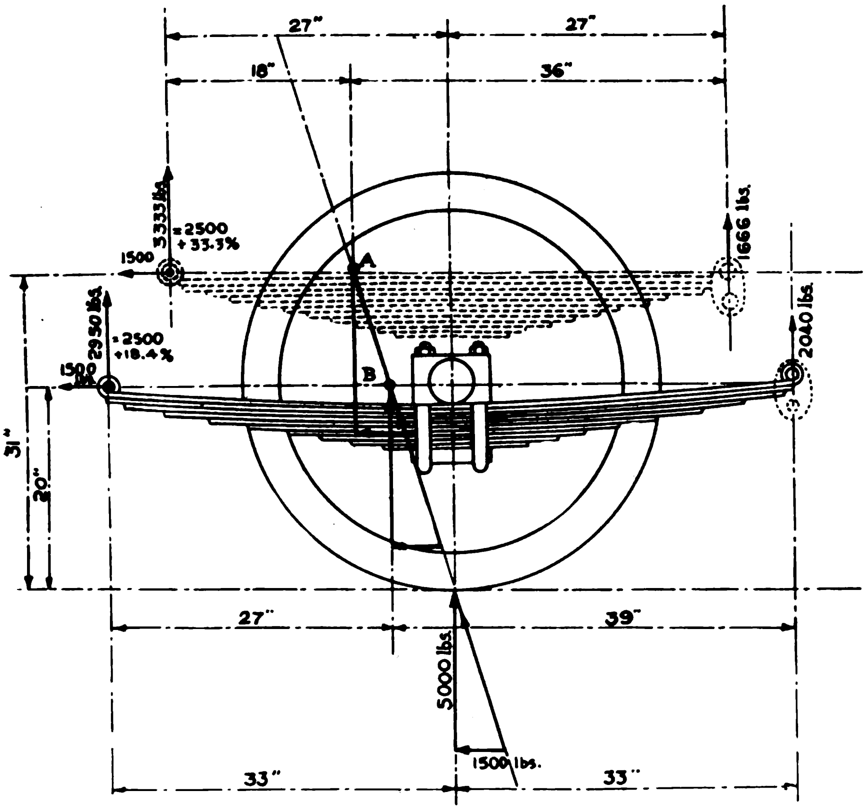

Fig. 5—An incorrect load diagram

Spark Plug Manufacture in Great Britain

PREVIOUS to the war the production of spark plugs in Great Britain was insignificant. There were three firms manufacturing, and their total output for all purposes during 1914 was not more than 5000. To-day five firms in the country are producing mica plugs, and their output for the year ending October 31 last was 2,148,726. The October output was 303,449, as compared with a monthly output of 420 in 1914. It is admitted, however, that there is room for further improvement of the mica plug for aircraft engines.

Acieral Aluminum Alloy Pistons

A NEW aluminum alloy which lends itself well to the production of sand-cast pistons is being marketed by the Acieral Company of America, New York City. The alloy is furnished in sand castings, rods and sheets. It does not contain any zinc, or magnesium, and is claimed to have a high tensile strength, the guaranteed minimum being 20,000 lb. per sq. in. Other physical properties of the alloy are as follows: Elongation, 2.5 per cent; Brinell hardness, 60; fusion temperature, 1380 deg. Fahr.; coefficient of heat expansion, about 50 per cent greater than that of cast iron.

We are informed that the Acieral alloy is the result of experimental and research work in France and the United States. Since there is no zinc in Acieral alloy, it is less given to crystallization than other aluminum alloys. The outstanding physical properties of Acieral are its compactness and homogeneity. The castings machine easily and take a very high polish. The specific gravity of the alloy is only 2.86, which is less than that of pure aluminum. All of the general advantages of aluminum pistons, such as light weight, high heat conductivity, etc., apply also to this alloy.

How Valuable Are Profit-Sharing Plans?

1—To the Employee 2—To the Employer

Any System Which Attempts to Satisfy the Physical Necessities of the Worker Without Increasing His Responsibility Must Fail

By Harry Tipper

THE changes in business organization in manufacturing establishments which have been made in the past few years, in the attempt to provide a common method of expressing the common desires and purposes of the human beings composing the organization, range all the way from complete "republics" to shop committees and boards of appeal indefinitely organized and with no authority. They represent, in fact, all stages of development, from the informal getting-together of supervisors and subordinates for a particular occasion to a thoroughly worked-out system by which the group of workers can be bound closely together for the purposes of production and distribution. While this variety is exhibited in the actual developments of such organizations, the same purpose runs through them all—the idea of getting-together so their grievances may be aired, adjustments made and a common responsibility understood.

Profit-sharing systems have been tried over a much wider field and to a much greater extent than systems of organization for these purposes. Because the wage system is the point of attack in almost all cases, and serves as the text for the actual expression of all forms of discontent, it has been the most usual point of consideration in the endeavors of manufacturers to remove the discontent. In fact, it is evident that for one manufacturer who has dipped deep enough into the causes of discontent to see the necessity for the creation of an organization to undertake their adjustment, fifty manufacturers have observed the fundamental failure of the wage system to satisfy the demand of the workers and have instituted some form of additional remuneration to adjust matters in this respect, which form amounts to profit-sharing to some extent.

Various Forms of Profit-Sharing

But there is a wide difference between these methods of wage adjustment and the organization attempts which have been considered in the earlier articles, in that while organization attempts are all based upon the fundamental principle of getting together and establishing a common responsibility, these attempts at profit-sharing run all the way from a mere arbitrary bonus upon wages given as a reward for production to a full-fledged system of sharing the profits of the organizations among capital, government and governed in the manufacturing establishment.

The numerous forms of profit-sharing which have been established to meet certain immediate necessities are not sufficiently important and do not depart sufficiently from general practice to be worth considering in this connection. Bonus systems for production, stock-sharing systems and time-study systems, where the payment is made for the different requirements of a task, are all valuable as far as they go, but they secure their principal value from the comparison with other establishments in which these systems are not in vogue. The common adoption of such systems would mean their elimination as a means of satisfying the worker and removing the causes of discontent or accelerating their adjustment.

This same thing of course is true in a very much greater degree of systems of high minimum wages with purely paternalistic interest in the worker's welfare, along the lines developed by the Ford company and others. Their present value is undoubted as a means of retaining the best class of skilled workers and of securing a flow of the most efficient skilled workers to replace those that naturally drop out. Such systems undoubtedly reduce the turnover and increase the productive efficiency so long as they represent a departure from the usual practice and have not been commonly adopted. They do not in themselves provide incentive and they are far removed from giving the worker any share in the responsibility for production or any partnership in the responsibility of the organization, and they must inevitably fail whenever the competitive advantage they offer is eliminated by the common adoption of similar systems in a general way. It makes no difference to what extent such systems may appear to remove the causes of discontent, temporarily to reduce the labor turnover and to eliminate strikes for a given period of time.

Must Consider Employee's Responsibility

Any system which attempts to satisfy the physical necessities of the worker or his present physical ambitions without increasing his responsibility in connection with the conditions of his own work in the organization unit of which he is a part is bound to fail ultimately because group organizations of human beings are held together by the common necessity and the common responsibility shared by all members of the group.

In the profit-sharing systems which have come to the writer's attention there are one or two based so evidently upon the responsibility of the various individuals of a group to the group necessities and upon unusual recognition of the value of a permanent working force that some examination of their condition is of interest as indicating the departure which has been made by individual concerns from the usual practice and the lengths to which individual manufacturers have gone in their endeavor to solve this labor question.

Had the following system emanated from a professional Socialist it would have been decried as Bolshevism, but it was established by a successful and hard-headed manufacturer who employs a force of 250 people, most of whom are not organized, and therefore could not at any one time develop much strength in a strike or materially embarrass his production.

The system is based upon three cardinal points:

1. The allowance of 6 per cent on the invested capital as a part of the expense of the business.

2. The provision of a living wage to all employees, from the president to the night watchman, this living

wage being based upon the general cost of living in the social surroundings which must govern to some extent their cost.

3. The division of gross profits equally between the invested capital and the workers in the business, including in the workers all who spend their time in the active organization of the business, from the president down. The details of this organization represent many further interesting facts. The one-half of the surplus of gross profit which is the share of the workers is divided as follows: One-third to the selling force, one-third to the executive department and offices, and one-third to the factory.

All Are Included

In each case this division includes supervisors and supervised alike. There is no distinction between the man who is spending his life governing a department of the business and the man who is spending his life working under that supervisor.

The amount paid out of the fund created by the allotment of this share of the profits for the worker is divided according to the salary which has been designated to each worker under the living wage clause. The wages themselves are adjusted periodically according to necessity, but they are adjusted only from top to bottom when any adjustment takes place. In other words, there is no adjustment of one worker or one department of workers because of a market necessity, so that there can be no discontent arising from an adjustment of wages which must be made.

The payment of the fund which is set aside for the active workers in the establishment has been the one point which has created considerable discussion and which has led to different methods in the three or four organizations which have established practically this system of operation.

In one instance the conditions are laid down by the officers of the company and no worker can secure his share of the fund except under those conditions. In the meantime the fund is deposited for them with the concern as trustee. In this concern the office staff, the selling force and the supervisors are paid their share annually in a lump sum, but the workers in the factory can only draw their money out under the following conditions:

First, leaving the employ of the company.

Second, buying a home.

Third, buying insurance.

Fourth, in emergency, to be determined only by the president of the company. The reasons for this are obvious. It is the desire of the company of course to protect a man against his own weakness to some degree, and it was found when this system was put into operation that some of the workers had spent all their money in a few days upon speculative investments and extended vacation from the work, a period of dissipation, and in other ways lost the value of their year's endeavors.

Profits Distribution Left to Committee

In another organization in which the same problem came up the conditions under which a man could draw the money accruing to him as his share in the profits were left to the determination of the committee of workers drawn by election from every department of the company.

In all these cases the living wage is placed at such a figure that it will pay all ordinary expenses, including the usual medical attendance, the education of children, etc., so that the share in the profits is expected to provide a fund for emergency and for old age.

The weakness of the first attempts in this scheme of profit-sharing was the placing of the fund at the disposition of the company itself, and to this is due some suspicion which has attached to it in the minds of some workers who have been familiar with the system. This difficulty has been eliminated in the later development by placing the control of the fund in charge of a committee of workers, so that it is not decided by the company, which might be suspected of deciding as to its disposition from the interests of the company itself.

There are two other out-croppings which come in as a necessary corollary to the adoption of this system which are in themselves of greater interest and perhaps have as much to do with the success of the system as the actual character of the profit sharing. The most important of these is the necessity for a statement to the employees as to the amount of business done, the cost of doing business, the profit, etc., so that the employees may know what their share will be. Without this of course the system would not remove the old suspicion that the scheme was a scheme to get a lot more work without giving a proportionate share of the increase to the worker. Books might be juggled, statements might be made which were not correct, and expenses introduced so that the result would be that at the end of the year only a small fund was available for distribution.

Keeping the Workers Posted

To clear away any possible misunderstanding in this direction and to give the workers an opportunity to see what the business is doing, a committee of workers, one from each of the different departments, meets once a month and gets up a statement of the condition of the business, being supplied with the information for that purpose from the company's books. Inasmuch as this committee takes in a man from each department, including the auditor's department and the purchasing department, it is obvious that the net result is complete publicity to the workers on the actual profits made.

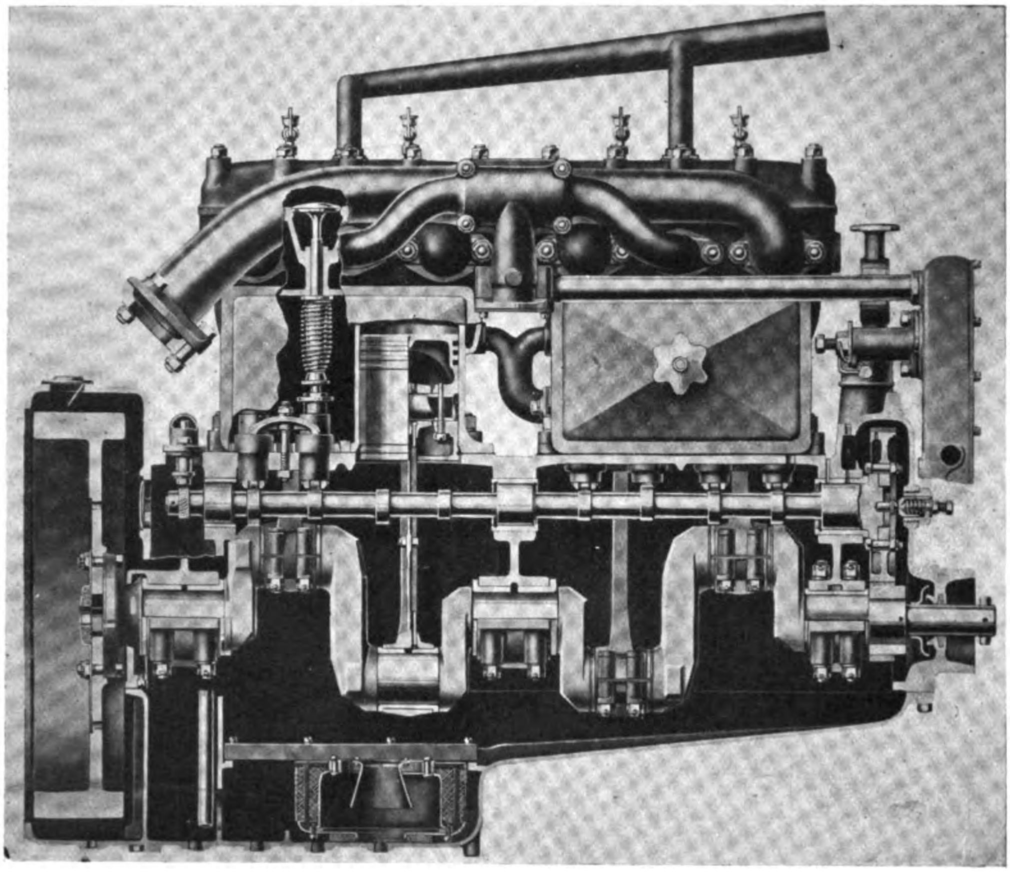
The benefits of this item extend far beyond the confines of the profit-sharing system out of which it grew. The real reason why there is so consistent a demand on the part of the workers for a larger share in the rewards of business without regard to the effect of such demands is the ignorance of the worker as to the percentage which becomes profit and the relation which his wages bear to the cost of doing business. Every worker in this establishment sees the statements simplified so that he can understand them as to the cost of material, cost of labor, cost of all items entering into the total expense of the business, and he has an opportunity to realize the insignificance of the share which capital is securing out of the business as an investment.

Has Stabilized Working Force

The system has been a success in the small establishments in which it has been tried. It has stabilized the working force so that the turnover of labor is very small. It has made each man an inspector, interested in the quality and speed of his output and of the output of the other workers. It has made each man take an interest in the maintenance of quality and accuracy all through the plant, because every worker receives a portion of his material advantage from the way in which the product is received on the market, from the price it secures, and from the contentment of the customer. It has developed an interest all through the organization in the necessity for pleasing the customer in every way, and it has resulted in the payment of a large amount above the 6 per cent allotted to the stockholders, so that the invested capital has not suffered by the development, but has apparently increased its earnings by this method.

Continental Adaptation of Class B War Truck Engine

Designed for Military Use, It Will Now Be Manufactured for Tractors and Heavy Commercial Cars—Aluminum Crankcase and Bell-Housing a Feature



Partial section through Continental B2 truck and tractor engine

THE Continental Motors Corp. has adapted the Class B war truck engine to commercial usage and is now on the market with its Model B2, which in all essential qualities corresponds to the Class B truck engine, being manufactured under the same rigid inspection rules, of the same material and to the same dimensions as this engine which was very successful in Government service. As this engine was designed with little regard to cost, to meet a high standard of performance and endurance, it is not by any means a low-priced engine, but on the other hand one which may be expected to give a good return in service in the tractor and heavy truck fields for which it is being manufactured.

The four cylinders are cast in pairs with detachable heads and mounted on an aluminum crankcase with a removable aluminum pan. The cylinders are L-head, with inclosed valve mechanism, and the engine is furnished in unit powerplant type adapted for three-point suspension.

The performance, as taken from a block test, is shown by the accompanying chart upon which are plotted curves of torque, mechanical efficiency, indicated horsepower, brake horsepower, thermal efficiency, fuel consumption and frictional horsepower. The cylinder dimensions are 4¾ in. by 6 in., or 120.7 by 152.4 mm.

The engine is strictly a heavy-duty type, having a piston displacement of 106 cu. in. per cylinder and 424 cu. in. for all four cylinders, with a clearance ratio of 25.3 per cent, giving a normal compression of 60 lb. The firing order is 1-3-4-2. The valves are on the right side of the engine, the head diameter being 2⅜ in. and the diameter of the opening, 2⅛ in. The seat angle is 45 deg. and the lift of both the inlet and the exhaust valve is 11/32 in. The manifolds are on the right side and assembled in a unit to give an exhaust heated intake. The engine is designed to take the standard No. 1 S. A. E. bell housing flange and the standard type of multiple disk clutch. The standard flywheel is 19⅞ in. outside diameter and weighs 126 lb.

The entire design is suitable for tractor use, in that

there has been no sparing of material where rigidity is required. The crankshaft is 2½ in. in diameter and is carried in three bearings. The camshaft is 1¼ in. in diameter and is also carried in three bearings. The crankshaft bearings are of the following dimensions (front to rear): 2⅜ by 3 in., 2½ by 4 in. and 2½ by 4 in. The camshaft bearings are: 2¼ by 2⅛ in., 2⅛ by 1¾ in. and 2 by 1⅜ in.

The cooling system is designed to be ample under the most adverse conditions of load and temperature, the water being circulated by a centrifugal pump located on the left side of the crankcase between two cylinder blocks. The water inlet elbow is cast iron, being integral with the pump, with rubber connections to each of the cylinder block intake headers. The water outlet pipe is of brass

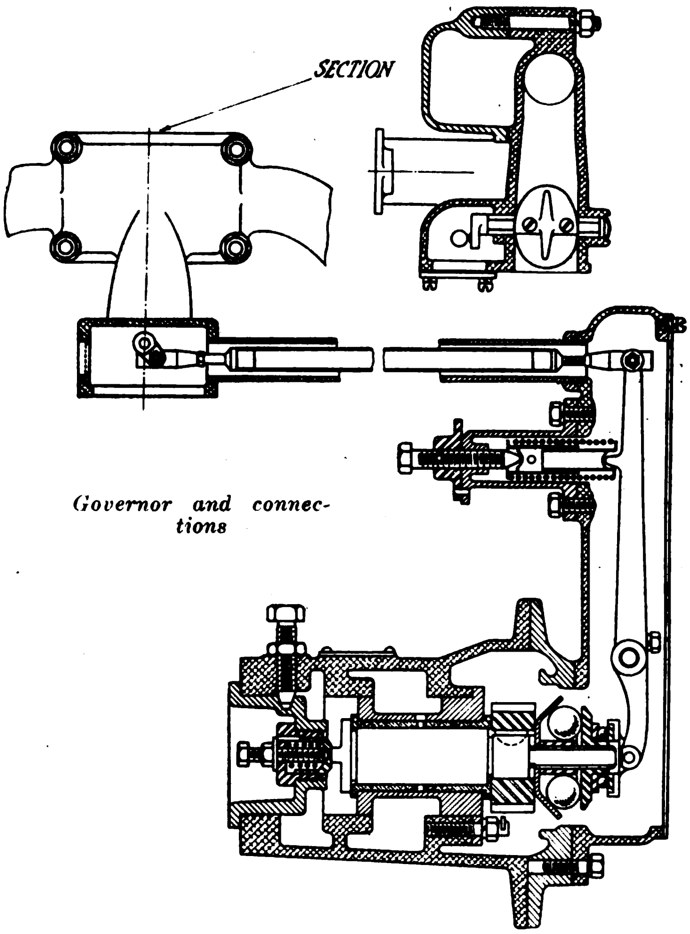
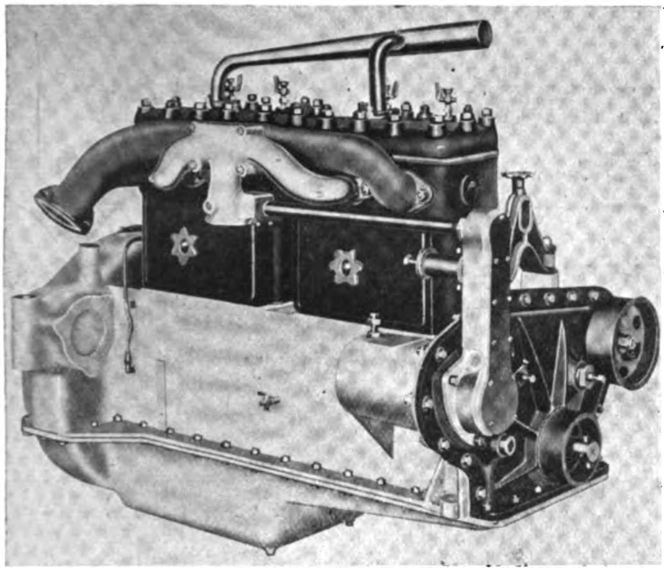
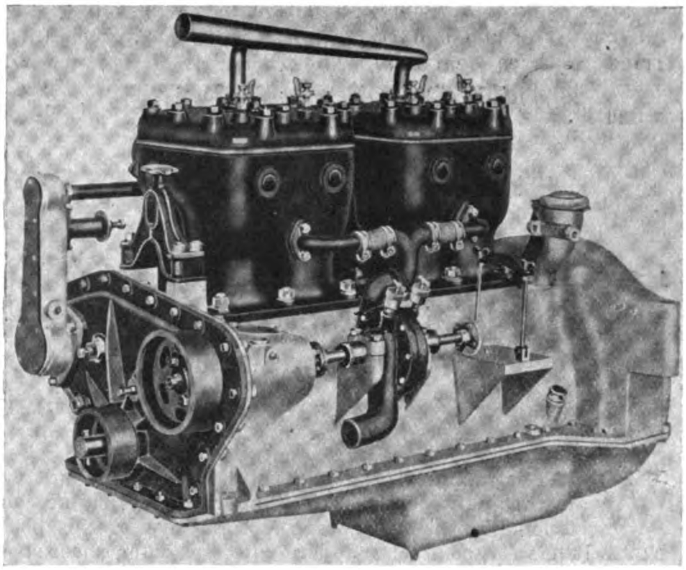
Cross section of engine



Governor and connections





Right side—Continental B2 truck and tractor engine—Left side

tubing and is a separate unit, tapered throughout its length. The water pump shaft rotates at crankshaft speed in a clockwise direction, looking at the front end of the engine. The fan is 20 in. in diameter and is driven by a flat belt, 2 in. in width, the drive pulley being 6⅜ in. and the driven pulley 3¼ in. in diameter.

A complete pressure feed is used for oiling, the oil pump being of the gear type and forcing oil to all bearings of the crankshaft, connecting-rods, camshaft, piston pins and gearcase. Splash is used for the cylinder walls.

The magneto is mounted on the left side and is driven off the water pump shaft. The carbureter fitting is for a vertical type, 1½ in. standard S. A. E. flange. Special provision is made in the gearcase for a distributor to be driven from the pump drive shaft. Spiral gear drive is used for the vertical shaft.

The governor is fitted and mounted on the gearcase cover and driven from the generator drive shaft. It controls the butterfly valve by means of a horizontal rod leading back to the intake passage. Provision is made also for a lighting generator to be secured to the right side of the engine looking at the flywheel end. This is driven by an independent shaft. The starting motor also mounts on the right side of the engine and attaches to pads cast on the side of the crankcase and to the boss on the flywheel housing. The starting motor drives through the teeth on the flywheel, connection being established by means of a Bendix shift.

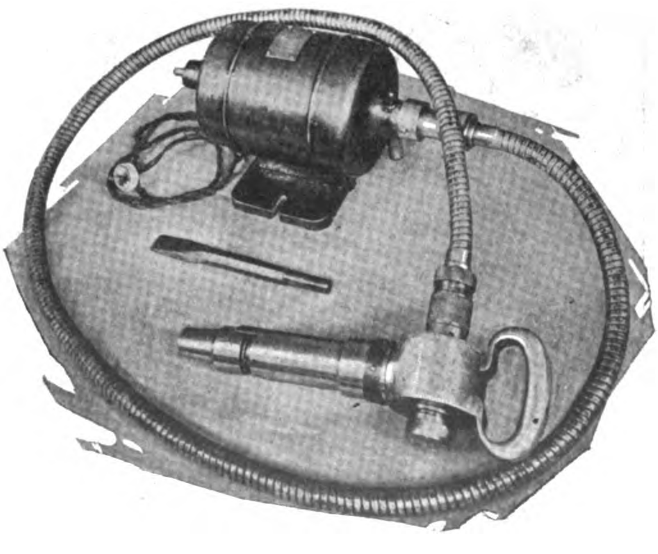
Titan Pneumatic Hammer

A NEW form of power hammer has been placed on the market by the Titan Automatic Tool Company, New York. The motive power is derived from an individual electric motor and is transmitted to the tool pneumatically, but the air is used in the hammer at atmospheric pressure only. The hammer outfit comprises three elements, viz., the hammer proper, the electric motor and a flexible shaft. The motor and shaft are standard construction and do not need to be described here. The motor is of from 1/10 to 1/3 hp., depending upon the size of the hammer used, and is of the shunt wound type. The length of the flexible shaft will vary in accordance with the work for which the hammer is to be used.

Within the body of the hammer is a chamber at one end of which is the tool holder and at the other end of which is a plunger which is reciprocated by the motor through the intermediary of the flexible shaft. Within the hammer is a freely slidable projectile which is hurled against the tool holder at the rate of 2000 times a minute, by the reciprocating plunger, whereby the hammering action is obtained. There are two openings or ports in the chamber, through which it communicates with the atmosphere when the hammer is not working. One of these ports, the lower one, is between the tool holder and the sliding projectile, and is never closed. The other port is between the plunger and the sliding projectile and is closed by the operator when the hammer is to be started operating.

Suppose the plunger to be rapidly reciprocated by the motor, the second port being open; the hammer then will not work because the pressures at both ends of the projectile are equal (atmospheric). Now suppose the second opening to be closed; then that portion of the chamber between the plunger and the projectile is no longer open to the atmosphere, and the travel of the plunger will reduce the pressure within the chamber. The sliding projectile will now follow up the plunger, owing to the fact that air under atmospheric pressure acts on the lower end of the projectile, the lower end of the chamber being always open.

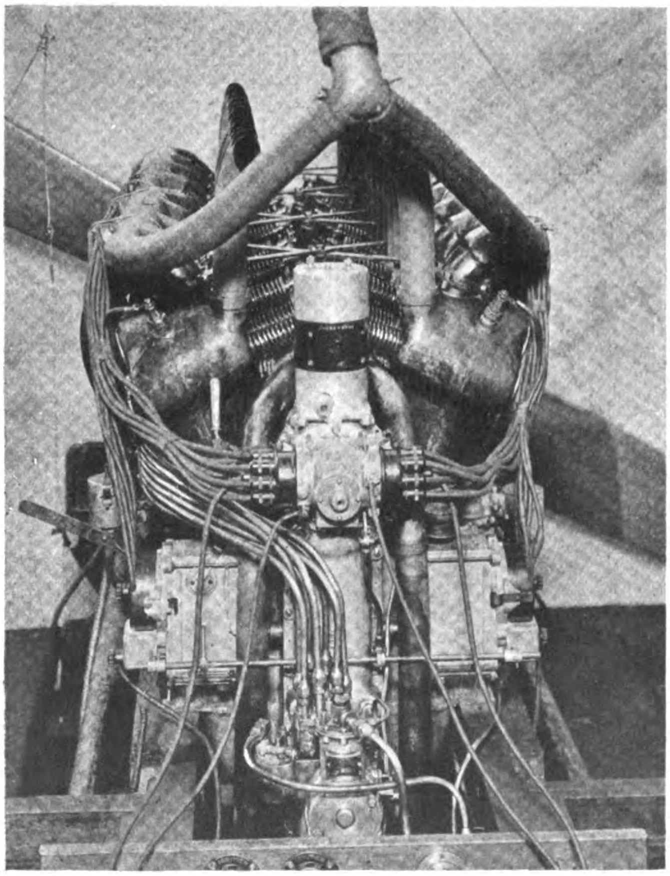
When the hammer is laid aside for a moment, it stops working, but the motor continues to run. One of the advantages claimed for this penumatic hammer is that no moving parts whatever are used to insure the proper return of the sliding projectile to its starting position.



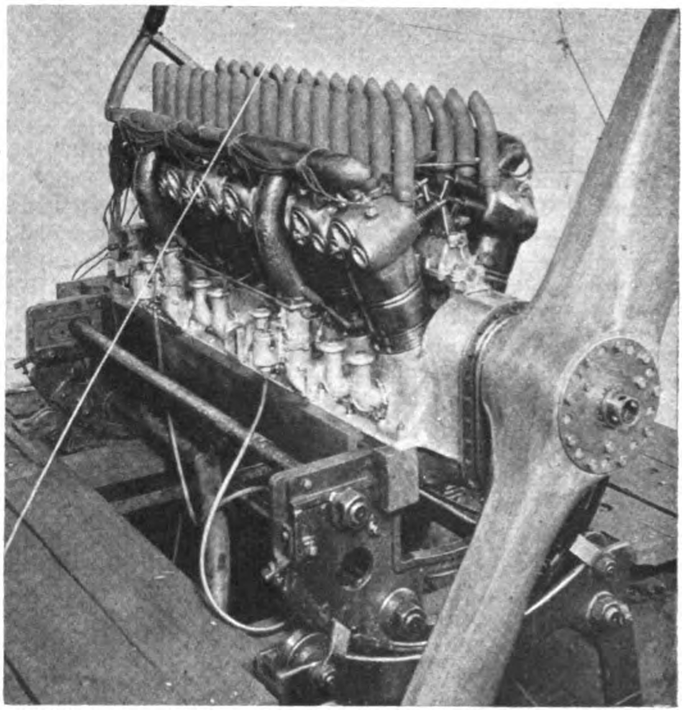
Duesenberg Sixteen-Cylinder Aircraft Engine

Largest Engine for Airplanes Ever Built in This Country—Weight Per Horse-Power Little More Than 1½ Lb.—Cylinder of Wrought Steel and Sheet Steel Jackets Welded On—Both Generator-Battery and Magneto Ignition

WHAT is probably the largest size engine ever built for aircraft purposes is a 16-cylinder V type engine constructed by the Duesenberg Motors Corp. of Elizabeth, N. J. It has forged steel cylinders with welded-on sheet steel jackets and a barrel type crankcase of cast aluminum. The cylinder bore is 6 in. and the stroke 7½ in., corresponding to a total piston displacement of 3393 cu. in. One engine of this design has been completed and has been subjected to a long series of tests and to experimental development. Three others, embodying some slight changes in design suggested by the tests of the experimental engine, are now in course of construction. While it has been the intention to build the engine in both the direct-drive and the geared-down type, the experimental engine has a reduction gear fitted. This consists of the Magg system of gearing, wherewith a greater degree of rolling motion is obtained than with ordinary involute gearing. The gears have teeth of approximately 3⅝ diametral pitch and 4 in. face. They give a reduction in rotative speed from 1800 to 1250 r.p.m., and the center distance of the two shafts is 8 in.



Distributor end of the engine, showing air starter, magnetos, battery distributors, electric generator



Three-quarter view of engine from propeller end

The cylinders are made from steel forgings and are open at both ends. The wall thickness varies along the length in accordance with the stresses to be supported, the average thickness being ⅛ in. On the outside of the cylinder are turned nine circumferential flanges, including the one by which the cylinder is secured to the crank chamber. This latter is located some distance from the lower end, the cylinder being formed with a spigot extending 2¾ in. into the crankcase. Most of the studs holding the cylinders to the crankcase extend through long bosses or lugs and are provided with nuts inside the case. The cylinder head is made of a series of stampings which are gas-welded together. It is cut with an internal thread and screws over the upper end of the cylinder against the topmost flange, after which it is welded in place. No. 18 gage sheet steel is the material from which the jacket is made. The latter is formed in three stampings, as shown in one of the photographs, which are welded together, to the lowest one of the small flanges and to the cylinder head. The object of the intermediate ribs is not only to strengthen the cylinder against radial force but also to help transfer the heat quickly from the cylinder wall to the cooling water. The top part of the head is a steel forging which carries a flange to which the jacket is welded. A couple of corrugations are pressed in the jacket at midlength to take up differences in expansion and contraction between the cylinder and jacket, as well as to stiffen the jacket wall.

As the maximum power which can be obtained from an

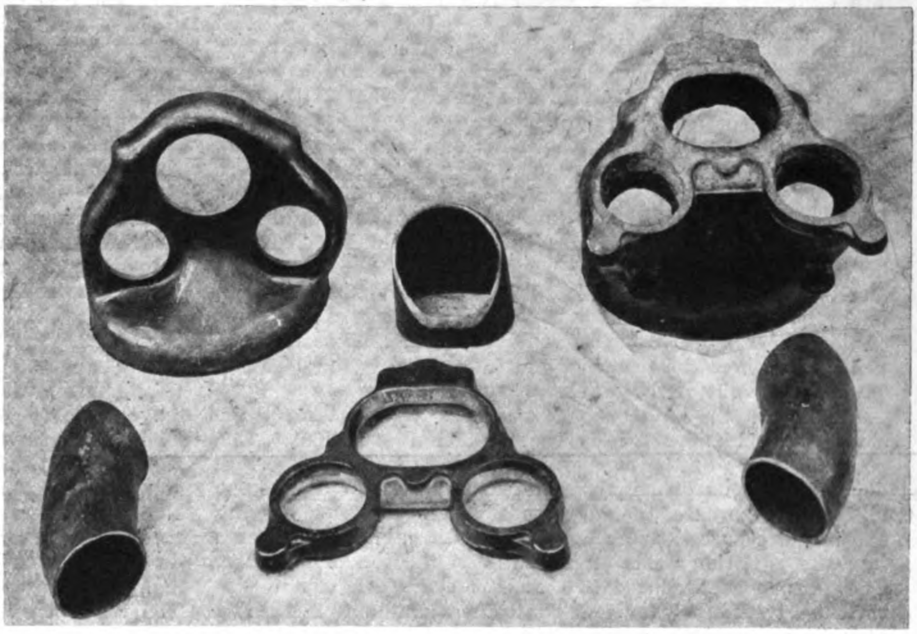
engine of a given piston displacement depends to quite a degree upon the compression carried, considerable interest attaches to the compression ratio of an airplane engine. In the Duesenberg 16-cylinder engine the ratio of compression chamber volume to total volume at the beginning of the stroke is about 21 per cent. The cylinder barrel is forged of low-percentage nickel steel and is case hardened on the inside to afford the best possible track for the aluminum piston.

With cylinders of this large size there are naturally very heavy stresses on the lower end of the cylinder, the base flange and that part of the aluminum crank chamber to which it is bolted, due to the side thrust of the piston against the cylinder wall. By tying the individual cylinders together these stresses can be distributed and the dangers of failure greatly reduced. In the Duesenberg engine the cylinder heads are formed with lugs by which each pair of adjacent cylinders are tied together. These lugs are so located that they overlap and a bolt passes through the two. In addition each pair of opposite cylinders is tied together by a couple of steel stampings which are clamped to lugs formed on the exhaust outlet flanges on the cylinder heads, one stamping being placed on top and one below the lugs and bolts being passed through stampings and lug. Each finished cylinder weighs 22 lb. The valve arrangement is very similar to that which has always characterized Duesenberg engines of smaller size, except that each cylinder has two exhaust valves and a single inlet valve. The valves are located in the cylinder heads with their axes perpendicular to the cylinder axis. The valves are arranged in a triangle, the two exhaust valves being located directly below the single large inlet valve. Thus the cool incoming charge passes directly over the heads of the exhaust valves and tends to keep them cool. The exhaust valves have a clear diameter of 2 3/16 in. each, with ½ in. lift, while the inlet valve has a clear diameter of 2 15/16 in. with 9/16 in. lift.

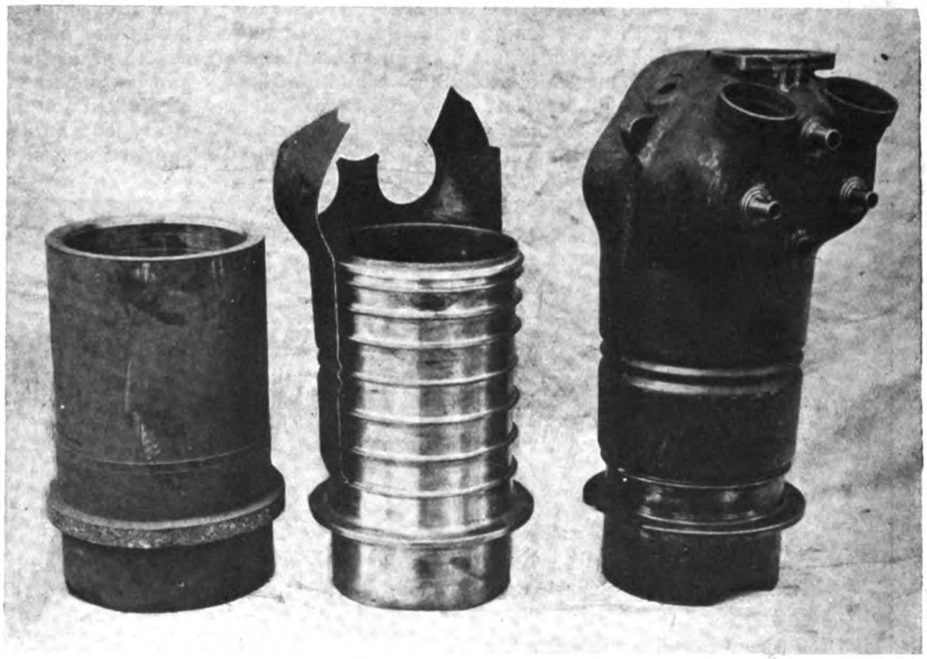
The valve stems pass through guides bushed with Non-Gran bronze and each is surrounded by two concentric springs which together exert a pressure (when the valve is closed) of 60 lb. in the case of the exhaust and 70 lb. in the case of the inlet valve. Each valve is actuated separately through a rocker arm from the camshaft located in a housing directly above the crank chamber. This housing is cast of aluminum, in two parts joined in a horizontal plane through the camshaft axis. It extends the whole length of the crank chamber, to which it is rigidly bolted, and it adds considerably to the strength of the latter in the vertical center plane. All of the rocking levers are bushed and are threaded over a hollow, stationary pivot shaft held between the camshaft housing and caps on same. At their lower ends the rock levers carry hardened steel rollers acting as cam followers. The openings over the valves are closed by means of shaped aluminum threaded plugs. These are formed with flanges on the inside in order to facilitate heat dispersion.

The pistons are cast of Magnalite and are formed with internal ribs for strength and to facilitate the transfer of heat from the piston head to the skirt. Each piston carries a single triple-unit Duesenberg compression ring, the details of which may be seen in the sectional view. The pistons are 7 in. long. The piston pins, which are made of chrome-nickel steel 1¾ in. in diameter, hollow, hardened and ground, have bearings directly upon the aluminum of the piston bosses. The connecting rod is clamped tight in the upper end of the connecting rod by means of a screw through a split lug on top of the rod. The rods are of the tubular type, of chrome-nickel steel. One rod is of the ordinary or straight type, while the other one on the same crankpin is yoked. The practice of having the piston pin bear directly on the aluminum is old with Mr. Duesenberg, having been employed in all of his racing engines, and has proved absolutely satisfactory.

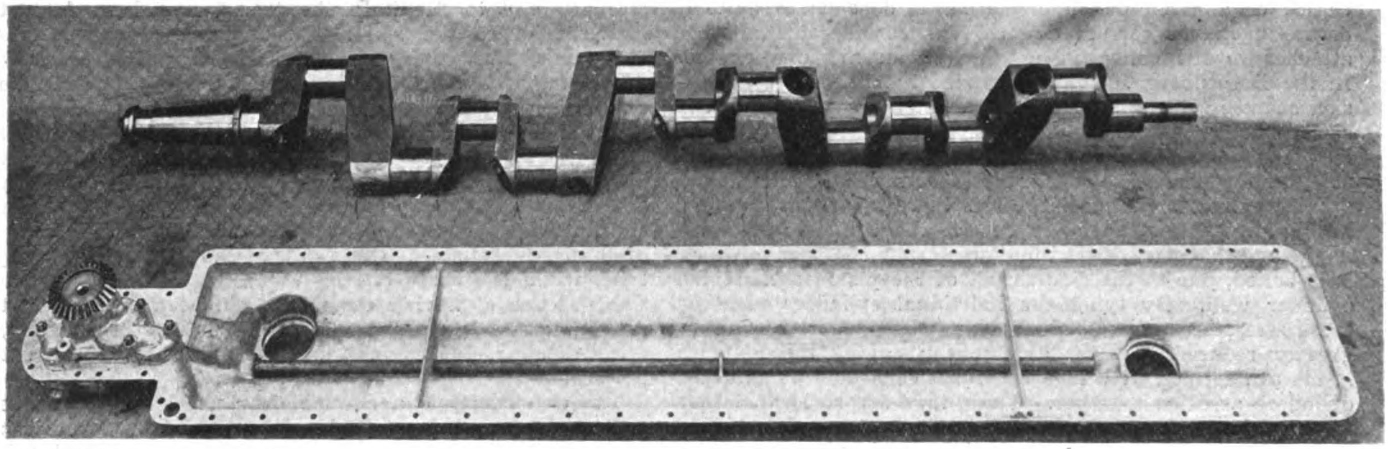
The crankshaft is a chrome-nickel steel forging of very substantial proportions. It is a five-bearing type and in one sense consists of two four-cylinder crankshafts joined end to



Parts from which the cylinder head is built up



Illustrating different stages in the manufacture of a forged steel cylinder with welded-on sheet metal jacket



Crankshaft and oil pan. Note that the oil pump is carried on the oil pan

end in such a manner that the planes of the two shafts are at right angles to each other. With the exception of the main bearing at the propeller end, which is a ball bearing, all bearings, both main and connecting-rod, consist of Non-Gran bronze shells with babbitt lining. All bearings are 2⅞ in. in diameter and 3 in. long. As indicated above, there are always two throws between adjacent main bearings and the crank pins of these two throws are connected by a long crank arm which is of nearly square section but is drilled lengthwise for lightness. The short arm at the propeller end also is drilled out in this way. While the crankshaft is quite husky, it contains absolutely no surplus material. The bores of the journals decrease from the valve gear end to the propeller end where the torque to be transmitted is the greatest. The total weight of the crankshaft is 199 lb.

As far as the intermediate bearings are concerned, the crankshaft is supported by the crankshaft positions. The partition walls of the case which carries these bearings are double or of box girder type, and to still further add to the rigidity of the case, the four studs which hold each bearing cap in place pass through holes drilled through enlargements in these partition walls all the way to the top of the case. These studs are reduced in diameter over their middle unthreaded portion. They screw into the aluminum of the case at both ends and in addition are secured by a cottered nut at the top.

Naturally the large number of closely spaced large holes for the cylinder tends to weaken the crankcase structurally, and to compensate for this weakening effect the case is made of the barrel type. The bottom is left open in the crankcase casting and is closed by means of a shallow aluminum base plate; the propeller end is also left open and is closed by means of a steel end plate worked out from a solid slab of steel with ribs, etc., to give the very strongest form for the weight. There are round hand holes on one side of the crankcase opposite each set of connecting-rod heads, which are closed with suitable cast cover plates. While there are box girder partitions in the crankcase at each intermediate crankshaft bearing, midway between these box girders there are substantial arch-shaped ribs and the panels of the lower portion of the case have inside diagonal or cross ribs to add to the strength of the case. A supporting flange is cast on each side of the case at the height of the crankshaft axis, for supporting the engine in the fuselage. The weight of the crankcase casing when machined is 180 lb.

Intermediate Shaft High Speed

The camshaft is driven through the intermediary of a vertical shaft with bevel gears at both top and bottom. The drive from the crankshaft to the vertical shaft is without change in speed, so that the latter shaft runs comparatively fast and can be made correspondingly light. This shaft is supported in annular ball bearings at both top and bottom. Near its lower end the vertical shaft carries a helical gear meshing with another helical gear on a cross shaft which drives the two Dixie magnetos used for ignition. These magnetos are set on bases cast integral with the crankcase. The reduction of 2:1 required for the camshaft is obtained at the upper end of the vertical shaft, where a small pinion meshes with a bevel gear of twice the number of teeth on the forward end of the camshaft. As a matter of construction it is interesting to point out that the bevel gear at the lower end of the vertical shaft is forged integral with the shaft, while the bevel pinion at the upper end of this shaft and bevel gear on the camshaft are secured in place by means of splined joints. Both of these latter gears have comparatively long hubs on which are mounted the inner races of the supporting ball bearings.

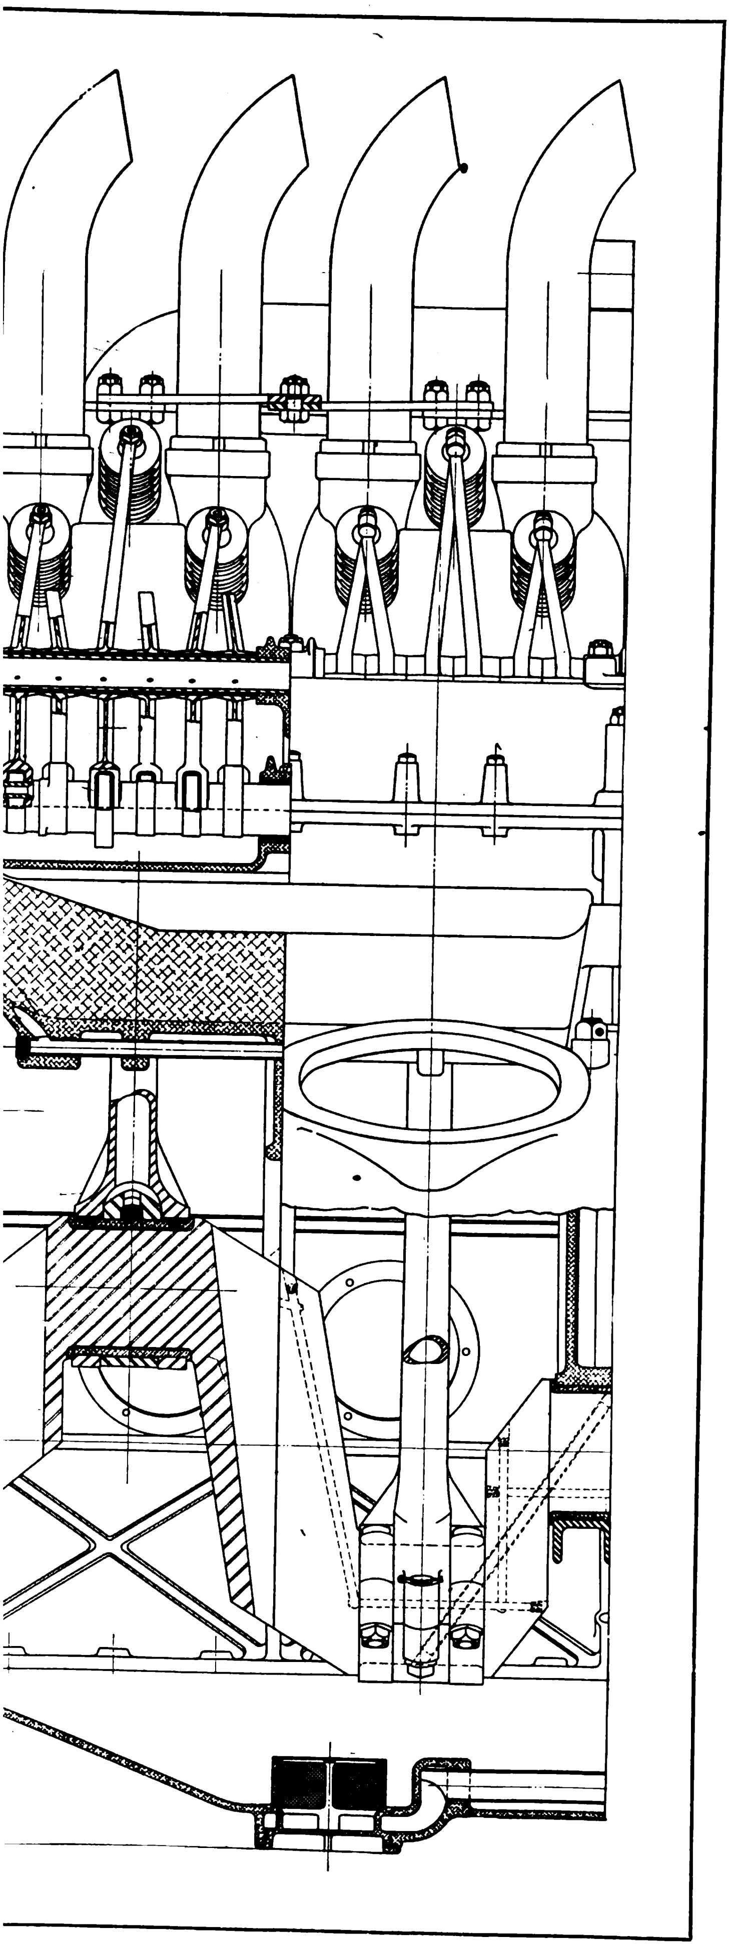
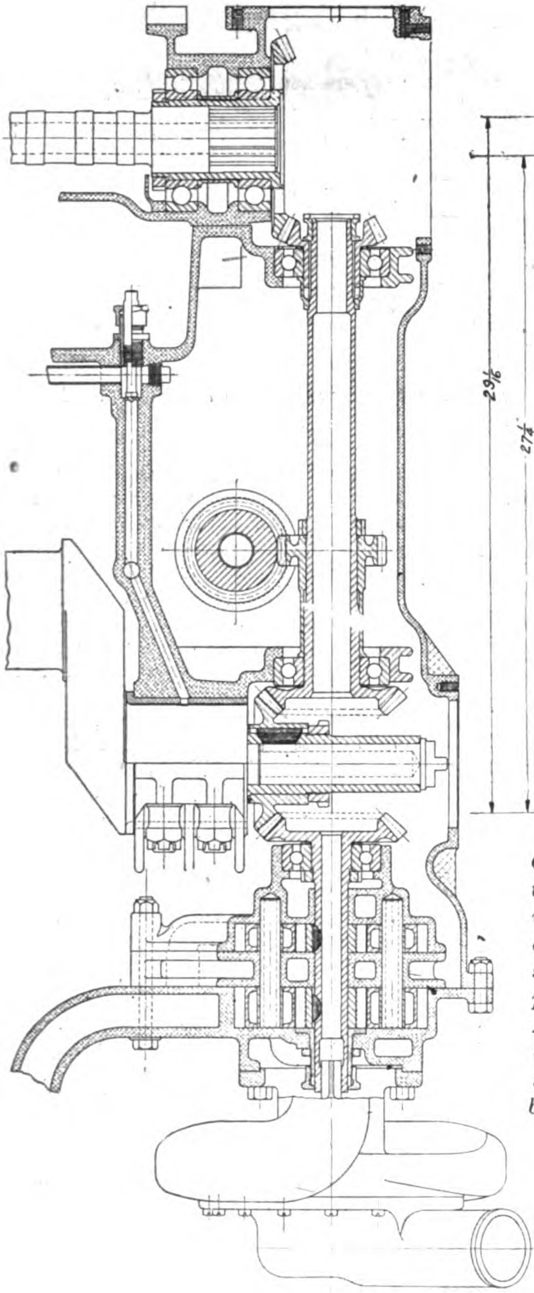
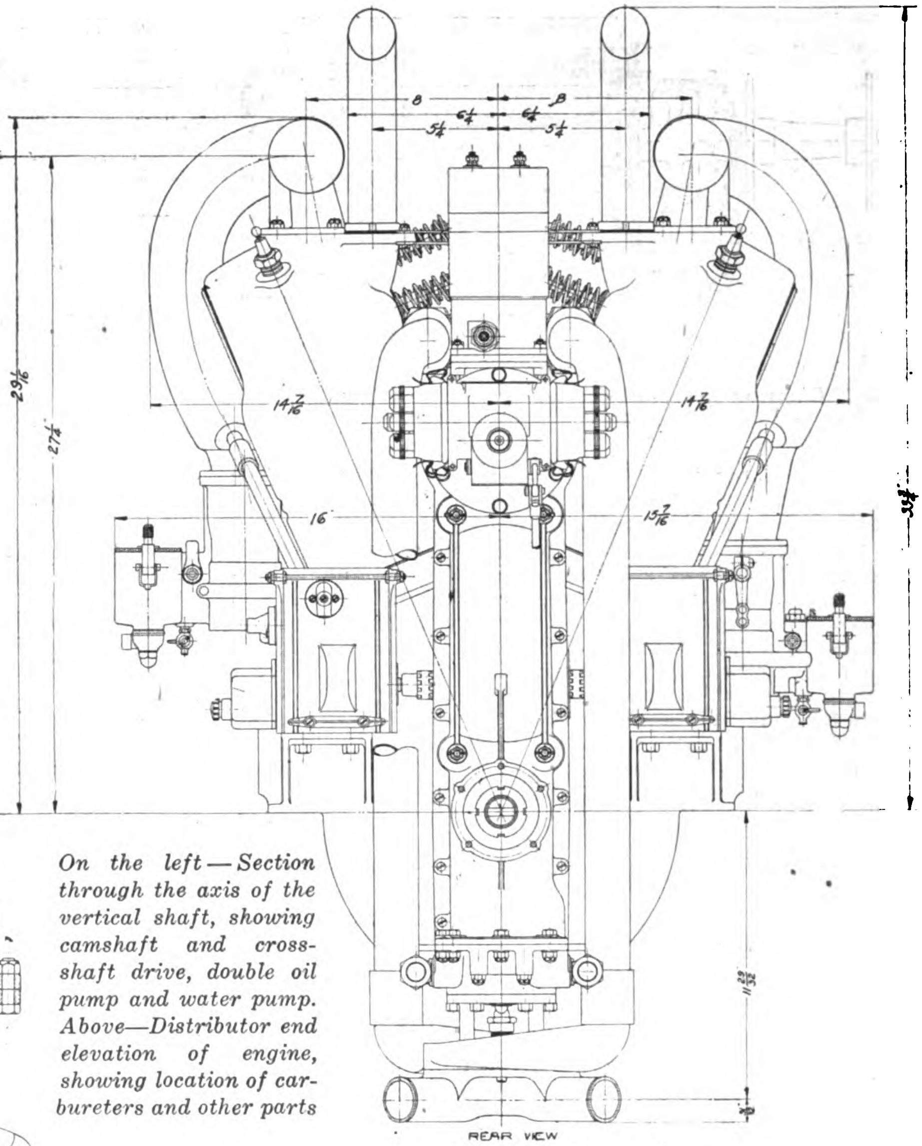
8"







On the left — Section through the axis of the vertical shaft, showing camshaft and cross-shaft drive, double oil pump and water pump. Above—Distributor end elevation of engine, showing location of carbureters and other parts

The camshaft is an integral forging with a main diameter of 1¼ in., the base circle of the cams being 1 5/16 in. The vertical shaft together with the gearing for the camshaft and the accessories is enclosed in an aluminum housing forming part of the crankcase casting. To the top of this housing may be bolted a vertical generator of Delco design, which is driven from the camshaft bevel gear. Directly below the crankshaft is mounted the oil pump, which is of the triple gear type and made in two sections, and below this is arranged the water pump, which is of the centrifugal type with two outlets. Both the oil pump and the water pump are driven through the same vertical shaft, which is in fact the shaft of the oil pump and which has the driving bevel gear forged integral with it.

In addition to magneto ignition provision is made for battery ignition, and a combination interrupter and distributor of Delco design is bolted to the vertical shaft housing directly in line with the camshaft. This distributor is driven from the camshaft by means of an integral key engaging with a transverse slot cut into the forward end of the camshaft. It is double-ended, eight cables extending from each end to one set of cylinders.

Combustible mixture is supplied to the sixteen cylinders by four carbureters of 2¼ in. size. Miller carbureters have been used on the experimental model. Air is drawn into the carbureters through the hollow partition walls of the crankcase, which at the sides of the crankcase debouch into semi-cylinders with their axes vertical. Caps are bolted over these outlets so as to form cylindrical sockets into which the carbureters are set. **On one side of the motor two of the carbureters are connected directly to the crank chamber and on the other side the two carbureters are fastened to an air duct, which in turn is secured to the crankcase opposite the central box girder. The ends of the box girder passages through which the air enters are intended to be connected up to funnels or scoops extending forward from the engine outside the fuselage, so as to take advantage of the speed of the plane to fill the cylinders.**

Of the two sections of the oil pump one is a feed pump and the other a scavenging pump, the lubricating system used being that known as the dry sump system. The pumps are mounted on the crankcase pan and are driven at crankshaft speed. The delivery pump forces oil through a single main oil lead fitted into the crankcase to each main bearing. The main distributing lead is fitted into the crankcase with packing glands, this being made necessary by the comparatively high oil pressure employed, which rises to 75 lb. per sq. in. when the engine runs at full speed. From this main distributing line a lead is taken off at the valve drive end, containing a regulating or pressure reducing valve which reduces the pressure on the oil to 2/8 lb. per sq. in. This low pressure line extends along the top of the crank chamber and from it there are two upward passages to the hollow camshaft and to the hollow rocker shaft. There are also passages through the cylinder flanges and cylinder walls, through which oil is

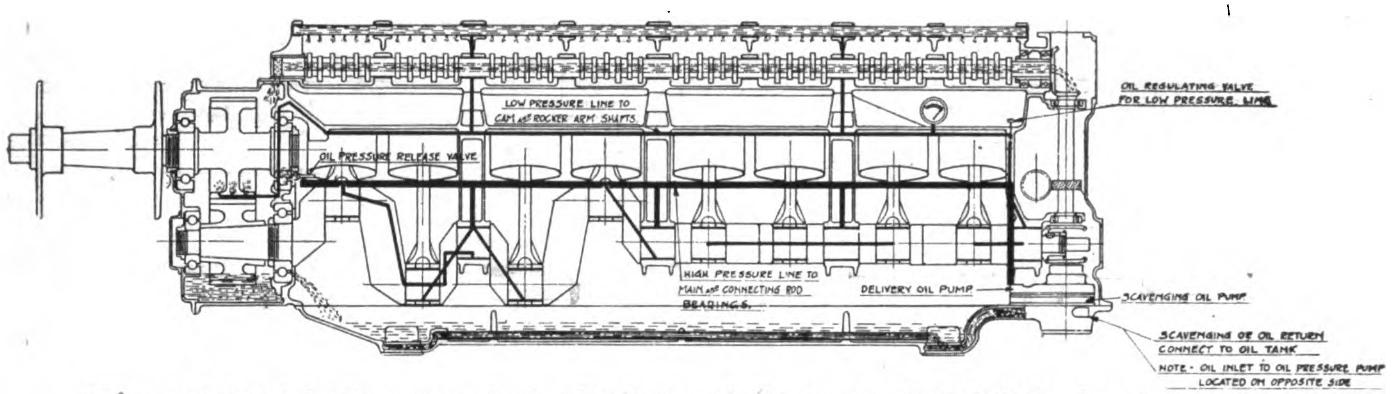


Diagram of the lubricating system, showing distribution of oil to main and crankpin bearings, to camshaft and rocker arm shaft

injected into the cylinders to insure their lubrication. The excess oil from the rocker shaft drops on to the camshaft and insures effective lubrication of the cams and rollers. The oil working out at the ends of the hollow camshaft returns through the reduction gear case, and the housing of the vertical shaft is at the opposite end of the engine. There is also a lead from the low pressure distributing pipe extending through the upper part of the crankcase into the gear reduction case, which has three lateral outlets opposite the gear close to where they mesh, so that there is a constant supply of oil to the gear teeth as they come in contact. There is at all times a supply of oil in the bottom of the gear reduction case, the height of which is determined by the ball bearing on the end of the crankshaft. The scavenging pump draws oil through large-sized strainers at each end of the crankcase. Owing to the use of these two inlet pipes, this scavenging pump will drain the crankcase no matter in which direction the engine is inclined.

It was stated above that all of the main bearings of the engine were supplied with oil directly from the main distributing line. The crank pin bearings get their supply from the main bearings through passages drilled through the crankshaft. In the case of the crank pin bearing closest to the propeller end the oil has to pass from the nearest intermediate bearing through a short crank arm, a crank pin and a long crank arm. While the oil overflows from the cam housing at both ends, there is a dam at the vertical drive shaft end which determines the level of the oil in the camshaft housing.

Water circulation is insured by the centrifugal pump already referred to, which, as stated, has a double outlet, one to each cylinder set. The water enters the jackets of the cylinder heads through water distributors with triple outlets. Two of these outlets direct streams against the exhaust valve seats, whereas the third outlet directs a stream down the cylinder jacket. In addition to the regular water return connection there is an outlet connection at the bottom of the cylinder jackets, the object being to prevent the formation of any dead spaces in the cooling jacket. The intake manifolds are water-jacketed and the water leaving the cylinder jackets passes through the jackets of the intake manifolds and thence to the radiator. The inlet manifold is held in position by means of a stamped steel piece, which also acts as a tie rod.

The weight of this engine with carbureters and magnetos is 1250 lb. Its output on direct drive, that is, with the propeller mounted directly on the end of the crankshaft, which does not admit of the highest speed of which the engine is capable, is 700 hp. When produced as a geared job, with the propeller turning at 1350 r.p.m., the output is given as 800 hp. No very extensive fuel consumption tests have been made, but from what observations have been taken it is believed that the consumption can be held within 0.56 lb. per hp.-hr., and the oil consumption is very light. The engine shows remarkable accelleration, and when under test on the dynamometer the torque was observed to be unusually steady.

A few words may be added regarding the reduction gear with which the experimental machine is equipped. The housing of this gear is cast integral with the crankcase, but the bearings are located in steel plates worked out from solid steel slabs which are secured to the aluminum housing by numerous bolts. The use of these very strong steel bearing plates prevents the spreading of the bearings in spite of the enormous radial pressure due to the gear reaction.

Reducing Industrial Fatigue

An Outline of the Principal Causes of Diminished Output, with Concrete Suggestions for Overcoming Them

IN the present emergency caused by the war it is desirable to understand all practicable ways by which industrial work may be made more efficient and output may be increased to a maximum without resorting to unwise or burdensome demands on labor. It is often possible to increase output temporarily by increasing the work of the employee, but if he is overworked his output soon falls off; hence such a method, if carried far, quickly defeats itself and in the long run is not profitable. Given adequate equipment, adequate administration of the plant, and a proper spirit among the employees, fatigue is the greatest single obstacle to a maximum output. Fatigue diminishes output not only directly, but indirectly, by increasing accidents and the proportion of spoiled work and by causing sickness and absences of employees. It will, therefore, be profitable to employers, to employees and to the Nation itself, to inquire into the ways that fatigue may be reduced.

Ways of Improving Efficiency

1—Introducing recess periods
2—Introducing variety into work
3—Adjusting the speed
4—Omitting unnecessary motions
5—Providing adjustable seats
6—Ventilation of work-rooms
7—Sanitary conditions within factories
8—Alternating day and night work
9—Adjusting hours of work
10—Avoiding overtime
11—Omitting Sunday work
12—Sanitary conditions outside factories

Everyone knows that a certain degree of fatigue is the normal result of bodily activity and is harmless. But it is not so generally recognized that the onset of overfatigue may be greatly hastened, and that through it deleterious effects on both the worker and the plant may be caused by the conditions of work inside the factories, or by the occupation, habits and conditions of living of the workers outside the factories, or by both.

In order to be sure that an individual is really fatigued, objective methods of measurement must be used —one often feels tired without actually being so, and likewise fatigue is often present before it is recognized by the individual. Fatigue may be detected by various tests, some of which have been studied so carefully and so improved that they can now be considered as fairly accurate and useful for practical purposes. Different methods are applicable to different cases.

Amount of output.—One of the readiest means of detecting fatigue is by keeping a record of the output of the individual employee by the hour, the day, or the week, and observing its course. A falling off in the output, when not explicable by other changes in the conditions of the work, indicates fatigue. Where the duration of the working period has been changed, fatigue can also be tested by comparing the average output per hour under the earlier and the later schedules.

Amount of power used.—A fall in the amount of electrical or other power consumed in a factory, or one of its departments, is often an excellent index of decreased output and thus of the fatigue of the workers. Lessened consumption of power must of course be discounted where it results from temporary shutdowns or other causes.

Other indicators of fatigue. — Fatigue is also often indicated by the amount of spoiled work turned out by the workers, by the number of accidents to the workers occurring during a working period, by the number of absences from work, and, in extreme cases, by records of sickness.

Laboratory tests of fatigue.—There are various tests of the presence of fatigue that have been supplied by the laboratories, some of which are applicable to industrial workers. These concern the muscles, the nervous system, sight, and hearing, and certain chemical changes within the body.

Ways of Reducing Fatigue

Various ways are now known by which fatigue can be reduced without decreasing the output and even in some cases with an increase of it. When fatigue is caused by work inside factories it is obviously controlled more easily than when caused by the conditions of living of the workers outside.

Introducing recess periods.—One of the common methods of reducing fatigue is by introducing recess or resting periods during a working spell. During such periods, which, in order to be effective, must be obligatory, and not discretionary on the part of the workers, they should have an opportunity to rest, relax, move about

The Divisional Committee on Industrial Fatigue has been active in planning and conducting investigations in factories that are manufacturing war supplies, for the purpose of determining whether unnecessary fatigue is present and discovering the conditions under which a maximum continuous output may be obtained. The work of investigation has been carried on under the auspices of the Division of Scientific Research of the United States Public Health Service, which appointed to its staff several members of the committee and paid the entire expenses of the investigations. In addition to the work of investigation, the divisional committee has prepared this paper on "How Industrial Fatigue May Be Reduced." It is intended chiefly for manufacturers, and presents in direct form some of the principal phases of the subject as it is now known.

and engage in other simple recreation. A little food or a cup of tea or cocoa taken at such a time is often remarkably restorative. A very striking instance of the benefits of resting periods has recently been published. "Two officers at the front recently, for a friendly wager, competed in making equal lengths of a certain trench, each with an equal squad of men. One let his men work as they pleased, but as hard as possible. The other divided his men into three sets to work in rotation, each set digging their hardest for five minutes and then resting for ten, till their spell of labor came again. The latter team won easily." It often happens that several five-minute resting periods may be advantageously introduced into a working spell. Where this is not practicable a single recess, of suitable duration, may suffice. The recuperation thus gained by a tired worker often increases his working capacity for the remainder of the spell. If pieceworkers object to such compulsory resting periods, fearing loss of wages, it is even profitable to guarantee that during the introduction of the change the total day's wage shall not be less than before the resting periods were installed. Experience has demonstrated that after such periods have been established the resulting increased efficiency usually yields equal, if not greater, output.

Introducing variety into work.—Much of the modern industrial work consists of a constant and rapid repetition of the same movement. A woman worker in one of our munition factories was recently observed to handle during her day's work 24,000 pieces of a shell fuse and put them through a special process. From 7 o'clock in the morning until 12 and from 1 until 6 she sat at her machine and fed it with the succession of brass pieces. The occasional introduction of a little variety into her work by training her to some alternative process might easily have diminished her fatigue without diminishing the number of finished pieces.

Adjusting the speed.—The capacities of different workers vary greatly. In order to secure uniformity in the work of a squad, where a single motor operates a number of machines, the speed of the motor must be adjusted to the average pace. It may be advantageous to transfer to another job an especially fast or slow person. It is of the utmost importance that each member of the squad should be able to work with the same rhythm and that the speed of operation should be adjusted to this rhythm. Fatigue is least when the speed is in consonance with the worker's customary rhythm, and the output may be twice as great as with a speed a little slower or even faster than this. The worker's speed, however, depends not merely on the adjustment of mechanical appliances, but is also often increased by a well-planned system of incentives, which may consist of piece rates or bonuses, or the making of the work itself more interesting and attractve.

Omitting unnecessary motions.—The pieces which the worker has to handle should be so placed with reference to height and distance from his hands that he is obliged to make no awkward, unrhythmical and unnecessary motions or excessive muscular exertions in handling them. His work can thus be done with the least possible waste of energy and time.

Providing adjustable seats. — Where workers are obliged to sit instead of stand at their work, the seats should not be of uniform heights, but should be adjusted to the individual worker, with backs of such shape and position as best to fit and support the worker's back. Such seats have recently been introduced in some of our large factories. Where the worker's feet can not reach the floor, foot rests should be provided. Such rests can be simply made by fastening a narrow board platform to the legs of the seat at the proper height from the floor.

Ventilation of workrooms.—The ventilation of workrooms is an important aid to efficiency and should conform to the principles of ventilation now accepted. The recent investigation of ventilation has demonstrated that excessive heat and humidity should be avoided so far as possible and that air should be kept in motion. When the worker is in a hot room, and especially when heat and humidity are combined, his bodily temperature rises, often several degrees, and he is put into a feverish state. While movement of the air will not cool the air, it will cool the skin and hence will keep down the bodily temperature to the healthful level. If possible, windows should be wide open; but where this is not possible and wherever even with open windows the heat of the workrooms rises above 68 deg., forced drafts or electric fans should be used to keep the air in motion. It is astonishing how easily a comfortable and refreshing bodily condition may be maintained by the use of electric fans. Air currents should not, however, be too strong. Bodily discomfort is caused by excessive drafts, and a gentle movement of air is the most effective. Uniformity in the play of air on the skin is undesirable; an oscillating electric fan or a frequent change in the rate of the forced drafts gives the best results.

Sanitary conditions within factories.—As accessory but none the less important means by which fatigue may be lessened and the efficiency of workers increased, there may be mentioned certain general sanitary conditions within factories:

1. Adequate lighting, with the light properly distributed and yet sufficiently concentrated on the work in hand to prevent eye strain.
2. An exhaust system to remove deleterious fumes and dust.
3. Abundant drinking water, cool but not ice cold, within easy reach of the worker.
4. Attractive, quiet rest rooms, especially for women, in which in times of need tired workers may find relief.
5. Lunch rooms or canteens, where a hot lunch of nourishing food, selected according to a scientific dietary, and well cooked, may be purchased at cost prices and eaten amid attractive surroundings free from the influence of the saloon.
6. Clean, well-ventilated modern toilets.

Washing facilities, with abundant soap and clean towels, and especially shower baths, where the hot, sweaty, begrimed worker may become cool and clean before leaving the plant.

Alternating day and night work.—The industrial urgencies of the war have caused many factories to run both day and night, and have thus increased greatly the total amount of night work performed. Man is not naturally a nocturnal animal, and under our present social arrangements night work must always be regarded as inadvisable on physiological grounds. Lack of sleep produces fatigue. The day sleep of night workers is likely to be curtailed, and in the long run night work is likely to be detrimental to health. This is probably more true of women than of men. The needs of the nation may require night work as an emergency measure, but this necessity should not obscure its dangers to health. If night work must at times be done, the question arises whether it is more profitable to keep the same workers on the night shift, or to change them at intervals, say every other week, from night to day, at the same time shifting the day workers to night work. The British Health of Munition Workers Committee has made a very careful statistical study of the output under both systems and has found that where the same night shift continues to be employed the total output is less than where there is an alternation of day and night work. This is

true of both men and women. Where night work is unavoidable, therefore, fatigue can to some extent be avoided by allowing the workers to alternate at intervals between day and night, the periods to be not less than one month in duration. Frequent changes of habits may be deleterious to health.

Adjusting hours of work.—A very obvious way to reduce fatigue is by adjusting the number of daily hours of labor. The British Health of Munition Workers Committee has found that it is a mistake to recommend a uniform day for all kinds of work, that the most profitable duration of the working period varies considerably with the nature of the occupation, and that women and boys, even when engaged in moderate and light types of work, are unable to stand as long hours as men. Within obvious limits, the length of the working day that avoids excessive fatigue can be determined for the individual process only by a careful study, in each combination of circumstances, of the effect of the work on the workers. The general tendency for many years in industrialism has been to decrease the hours of labor. The one great objection that is usually raised against a proposal to decrease hours is that the output would be correspondingly diminished; and accordingly, whenever, as at the present time, unusual strain is brought upon industries and the greatest output is desired, there is a tendency to increase hours and to introduce overtime work. This objection to decreased hours and this tendency to increase them rest in considerable part on a mistaken notion. It is obvious that a man can do more work in two hours than in one hour; but it does not necessarily follow from this that he can do more in 12 hours than in 10, or more in 10 hours than in 8. In fact, whenever the work is of such duration that fatigue begins to be pronounced, it has been shown again and again that shortening the working period actually increases the amount of work done.

This may not always be evident in the first few weeks, but it appears later. Innumerable instances of this might be quoted. Thus a certain granite-cutting company found that "the same man under identically the same conditions accomplished more of exactly the same kind of work when he was working 9 hours than he did when he was working 10 hours. And again when the hours were reduced to 8 hours this same man accomplished still more in an 8-hour day than he did in a 9-hour day, or a considerable amount more than he did when the day was 10 hours long." In an English munition factory when the average weekly hours of men sizing fuse bodies were reduced from 58.2 to 51.2 the total output was increased 21 per cent. In the English factories the absences of employees from their work have increased enormously since the war began. In one of the largest munition factories, employing 70,000 hands, the efficiency of the work was thus greatly interfered with. The employers were advised to give their hands a whole holiday, instead of a half holiday, on Saturday. This was done, and the absences were diminished by 50 per cent.

The exact relationship between length of day and quantity of output is not yet fully investigated for all conditions, but the great preponderance of evidence favors a reasonably short working day even in the interests of the industries themselves.

Avoiding overtime.—Arguments that favor the short working day apply directly to the question of overtime. If the usual day's work is such as just to stop short of undue fatigue, overtime means overwork. It is of course sometimes necessary, in order to complete a contract within a required time, to call on the workers to expend the greater effort required. It is, however, a dangerous expedient and a particularly insidious way of diminishing a worker's efficiency. Overtime work is apt to result in an increased amount of spoiled work and in lessened output and increased absences on subsequent days, and because of this and also in view of the increased rate of wages that must usually be paid overtime is not as profitable as is often supposed.

Omitting Sunday work.—The same principle holds for the duration of weekly labor. It is generally acknowledged by those who have studied the question most carefully that all workers should have one day's rest in seven. At the beginning of the war the amount of Sunday work in the industries of the world was greatly increased. After little more than a year the British Health of Munition Workers Committee reported as follows:

> Statements are made by many employers that seven days' labor only produces six days' output, that reductions in Sunday work have not, in fact, involved any appreciable loss of output, and even the less observant of the managers seem to be impressed with the fact that the strain is showing an evil effect. * * * The evidence before the committee has led them strongly to hold that if the maximum output is to be secured and maintained for any length of time, a weekly period of rest must be allowed. Except for quite short periods, continuous work, in their view, is a profound mistake and does not pay—output is not increased. On economic and social grounds alike this weekly period of rest is best provided on Sunday.

Sanitary conditions outside factories.—Fatigue resulting from the work inside the plant will appear sooner and be a more serious hindrance to output if the worker is not in sound condition of body and mind when he comes to his task. Anything which an employer can do outside the plant to promote bodily health and vigor and mental contentment is in the long run profitable. It aids in securing a higher class of workers, greater loyalty to the company, a lessened labor turnover, greater skill, and greater general efficiency. Modern housing, attractive home surroundings, opportunities for healthful recreation, club facilities—whatever will keep workers away from the saloons and other places deleterious to health—are all safeguards against industrial fatigue.

The above are some of the ways by which fatigue in industrial occupations may be reduced. Their applicability varies with the different occupations of workers. Conservation of the working power of our industrial army is as essential to our success in the war as is conservation of our military and naval efficiency and our food. Great Britain has been foremost among our allies in recognizing this, after having made during the first year of the war the costly mistake of wasting her industrial forces through needless and avoidable fatigue.

In this country the Division on Industrial Fatigue, composed of scientists organized under the Committee on Labor of the Council of National Defense and working in co-operation with the Public Health Service, is now engaged in examining munition factories and other industrial establishments that are manufacturing war supplies. It aims to bring together the combined resources of scientific investigation and the practical experience of industries in this and other countries to show how avoidable fatigue may be eliminated, and how in the present exigency the greatest output of the necessities of war may be secured compatible with the maintenance of the working power of the workers. The Divisional Committee is contributing freely the time, knowledge and experience of its members for the benefit of the industrial work of the country and thus for the Federal service. Should any industrial corporation that is now engaged in manufacturing war supplies desire the services of the committee, communications should be addressed to the executive secretary at the office of the committee, 437 West Fifty-ninth Street, New York City.

Heald No. 65 Cylinder Grinder

Of More Rigid Construction Than the Older Type and Is Better Adapted to Manufacturing Operations—Driving Mechanism Also Improved

THE Heald cylinder grinder, which has long been favorably known to gasoline engine manufacturers, has recently been redesigned, the new model being known as the No. 65. The machine has been made more of a one-purpose manufacturing tool and less of a universal machine, whereby its efficiency in manufacturing operation has been increased.

Both the eccentric grinding head and the work table are now supported by a solid bed, where formerly the work table was supported on a knee that could be moved up and down on the face of the column of the machine. This arrangement may have been an advantage in repair work, as parts of widely different form could be put into the machine and lined up for having holes in them ground out. In manufacturing operations, however, when the work is confined to cylinder grinding, this wide range of vertical adjustment is of no advantage, and the greater rigidity obtained when both the grinding head and the work table are mounted on the same bed is especially desirable. Sometimes it will happen that one of the bores in a multi-cylinder casting is machined with its axis out of plane with the other bores. It then becomes necessary, in centering the grinding head, to adjust the work table, and for this purpose a means of vertical adjustment, affording a range of ⅛ in., has been provided. This adjustment is obtained by means of a slide between the main bed and the cross slide. This slide moves on inclined ways on the bed, and when moved in the direction of the axis of the main table, also moves up or down. It is moved by means of a bevel gear and screw and nut mechanism. The shaft of the driving bevel gear extends out from the bed at the front of the machine, and can be turned by means of a hand crank, which can be applied to it.

The dogs for controlling the travel of the table, instead of being mounted on the bed, are carried on a dog bar which is supported by the intermediate slide. The advantage of this arrangement is that the position of the grinding wheel relative to the work is not changed by any vertical adjustment of the work.

On the rear of the machine is the main driving shaft, which takes the power directly from the main line, thus dispensing with a countershaft. This constitutes what is known as a single pulley drive, and makes the machine entirely self-contained. The grinding spindle is driven from this main shaft through a flexible idler, which maintains a uniform belt tension. This idler and the long spring putting it under tension are clearly shown in the end view of the machine herewith. For grinding holes of various diameters, different speeds of the wheel are required, and these are obtained by means of interchangeable pulleys on the wheel spindle.

Speed Box in Front

Looking at the front of the machine, in the lower left hand corner of the bed is seen the main speed box, which is driven directly from the driveshaft by a belt through the bed. By means of this speed box the eccentric can be given two different speeds, the speed box containing two pairs of spur gears controlled by individual friction clutches. The lever for operating these clutches is plainly seen in the front view. The box above the one referred to controls the main table and affords three different rates of speed at which the work can be fed past the wheel. It contains a double cone of gears, which is operated by means of a sliding key controlled by an upright lever.

The speed box is connected with the automatic reverse box on the right hand end of the machine by a plain shaft, which can be seen in the front view. The reversal of the table may be controlled independently by a small hand lever located directly above the starting lever. This reversing lever is located in a position very convenient for the operator. In fact, all of the control levers are located close together, so that the operator can reach them without any

End view of grinder, showing automatic belt tensioning device

special effort. By means of a friction clutch inside the base, which is operated by the large horizontal lever at the front of the machine, the main table can be started and stopped. In order to permit the operator to rapidly adjust the work slide, a hand feed has been provided for the table.

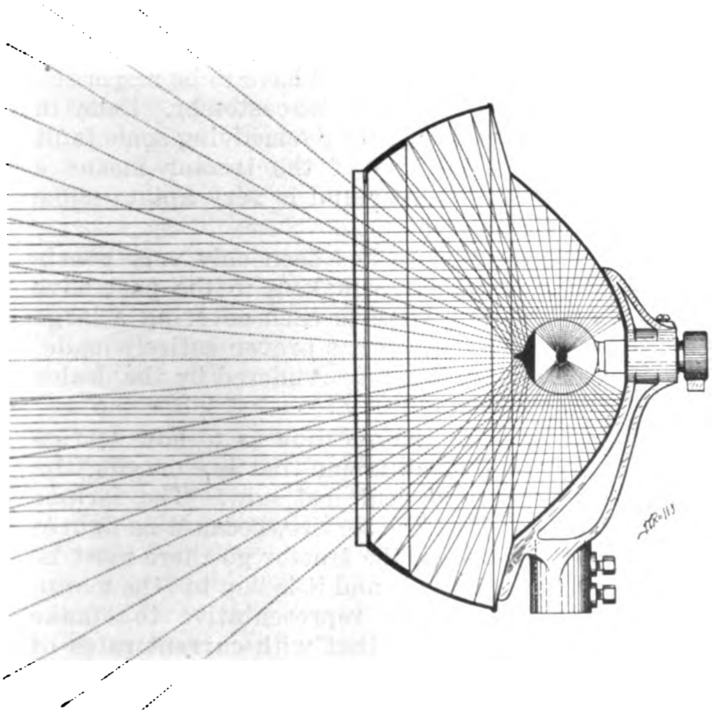
The main table slides on ways of the dove-tail form with a heavy gib. Oil pockets and rolls provide for ample lubrication. The main table is provided with large bearing surfaces and has been made of sufficient length to protect the ways on which it slides from grit and dust.

The machine has a cross-slide for accurate cross adjustment of the work. The feed screw has a graduated dial reading to thousandths of an inch, and adjustable dogs are also provided for indicating the center to center distance between cylinder bores. No important changes have been made in the design of the grinding wheel spindle and the feeding arrangement for the eccentric, as these features have been found very satisfactory in the former No. 60 machine.

On the main driving shaft at the back of the machine is a pulley for driving the lubricant pump. This latter is of the horizontal centrifugal type. Provisions are made in the design of the work table and intermediate slides to catch the lubricant which flows through a channel in front of the rear of the bed, and then into the pump reservoir. The cover of this reservoir has several compartments, the partitions being so arranged that most of the sediment is removed before it enters the tank proper. Provisions are also made for driving an exhaust fan from the main drive shaft. These fans are sometimes used in cylinder grinding to carry away the material as fast as it is removed by the wheel.

Roffy Non-glaring Headlamp

J. T. ROFFY, of Brooklyn, N. Y., who has done considerable work in the vehicle lighting field, has recently developed a new headlamp which projects a very strong beam of light forward and at the same time permits of complying with the laws prohibiting annoying glare. In the Roffy lamp a reflector similar to the usual type is combined with an inverted reflector ahead of the bulb. The forward part of the bulb is frosted, so that no direct rays from the filament can strike the eyes of persons in the road. The main reflector, instead of being of parabolic form, is a compromise between a parabolic and a spherical reflector. Mr. Roffy states that with a parabolic reflector and the ordinary type of filament, rings of light are produced, while with a plain spherical reflector the light is dispersed too much, and it is impossible to obtain a strong parallel beam. The intermediate type of reflector does away with the rings, giving a uniform beam of great intensity. The light bulb is surrounded by the main reflector to an angle of 105 deg. The annular reflector in front of the main reflector does not throw the rays back upon themselves, as is sometimes done to intensify the source of light, but has its focus at a point ahead of the focus of the main reflector. As a matter of fact, the rays of light from the filament striking this annulus are reflected on to the screen surrounding the tip of the bulb, and are reflected by this screen, which thus presents a large, luminous surface giving a mellow light. No part of the filament is directly visible to the eye, and Mr. Roffy contends that owing to this fact, where it is required to dim the light, it is not necessary for him to cut down the illumination to the same degree as is necessary with an ordinary reflector.



Sectional diagram of Roffy headlamp

In order to conform to anti-glare laws in various states, the lamp is set at an angle with the horizontal such that its axis is inclined 3:100 to the horizontal. This inclines the beam of light forwardly, and at a distance of 75 ft. from the lamp, the intensity of illumination at a height of 42 in. above the ground level is not at all objectionable.

Provisions have been made for adjusting the bulb in the lamp. The stem of the socket is held in the rear of the lamp by means of a set screw, and when this has been released, the socket can be moved forward or back and can also be rotated on its axis, which has been found to be of great advantage, as the filament does not always lie in the axis of the bulb.

In his experiments Mr. Roffy has found that what he calls the critical angle for metal reflectors is 52½ deg. That is to say, if a metal reflector is made to embrace a greater angle of light than this, the result is reduced visibility at a distance.

Tests made by the Electrical Testing Laboratory, New York, with a Roffy 7¼-in. reflector lamp containing a 28-candlepower bulb with frosted tip showed 130,000 apparent candlepower in the axis of the lamp 100 ft. away and 150,000 apparent candlepower at 1 ft. to the left of the axis 100 ft. away. In the median vertical plane 1 deg. of arc below the level of the lamp it showed 2100 a.c.p. at a distance of 100 ft., and 4 deg. of arc to the left of this plane and 1 deg. of arc above this level it showed 800 c.p.

Water Pump Drive in Liberty Engine

A VERY evident error occurred in the description in AUTOMOTIVE INDUSTRIES of the manner of driving the water pump on the Liberty aircraft engine. The paragraph in question occurred at the bottom of page 994 and read as follows: "The water pump is driven from a vertical shaft which takes its drive from the same vertical shaft that drives the camshaft driveshaft and the generator. This shaft extends downward and has a bevel gear which meshes with a bevel gear on the end of the pump shaft, thus accomplishing the drive."

This is evidently an error, since the camshaft driveshaft extends upward and not downward, and the passage should read as follows: The water pump is driven from the water pump bevel driver. The bevel driver has two bevel gears on an integral spool mounting. The upper gear takes its drive from the crankshaft bevel gear and the lower meshes with the gear on the end of the water pump shaft. An inspection of the drawing on the insert opposite page 992 will readily explain the drive of the water pump and oil pump.

Automobile Most Prosperous German Industry

IN an article in the *Frankfurter Zeitung*, dealing with the war boom of the German automobile industry, it is stated that the latter has been more prosperous during the period of the war than any other German industry. Throughout the war the demand for automobiles and gasoline engines ran ahead of the supply, numerous additions to plants were made, and the investment of new capital has been much in request.

HORSELESS AGE SUBSCRIBERS
Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.
Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.
Member of the Audit Bureau of Circulations.
Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Pay Informal Contracts Immediately

IF Congress would devote its energies toward quickly passing a bill for the payment of informal contracts instead of becoming hysterical over a reported labor surplus it would quickly balance labor and capital conditions.

For several months the Treasury Department has refused to pay holders of informal war contracts—those contracts made via telephone, telegraph or verbally and therefore not legally executed. For several weeks the House debated bills authorizing payment of these contracts. Finally it passed the Dent bill.

Since that time three additional bills have been presented amidst delay, procrastination, argument and discussion—wasting valuable time, hindering the War Department, the Treasury and particularly manufacturers throughout the country.

Manufacturers in Michigan and Ohio holding $300,000,000 worth of war contracts not legally executed are becoming impatient, and rightly so. Their bankers are anxious and they have had to lay off workers while awaiting adjustment.

Very recently there has been much talk about "too rapid demobilization" by Congressmen stimulated by labor organizations. They point to the growing surplus of labor in Detroit and Toledo.

Less talk about labor surplus and more action toward just payment to the manufacturers is what is needed. Give the employers their money and they will quickly absorb any labor surplus.

The bill now before the Senate Military Affairs Committee drawn by the War Industries Board and approved by the U. S. Chamber of Commerce, the Motor and Accessory Manufacturers' Association and other industries appears to include all the necessary features.

This bill or some other equally equitable should be passed at once.

Tractor Service

IT is a well-known fact that tractors require a comparatively large amount of service from the dealer if they are to give satisfaction and "stay sold." The tractor is a recent development and its details have not yet been worked out to the same nicety as those of the automobile, for instance. Moreover, tractor work is very severe, the engine running under nearly full load all the time and all parts being stressed to a high degree. The majority of tractors burn kerosene and the use of this fuel involves greater difficulties than that of gasoline and is the cause of considerable trouble, especially to operators unfamiliar with it.

Not only does the tractor require a considerable amount of service, but this service is of a kind that is rather expensive. It has to be given on the farm and very often in the field. Most of the calls upon the dealers or service men will be made during certain very busy seasons and will have to be responded to at once in order to satisfy the customer. Delay in furnishing a necessary part or remedying some fault interfering with the use of the tractor means a serious loss to the farmer and is very apt to make him dissatisfied.

So far tractor service has been only very poorly organized. Several large makers in the past have had a few traveling experts each covering a large territory, but this method has proven entirely inadequate. The service must be rendered by the dealer who is always nearby.

This brings us to the question as to how service is to be paid for, which is one that is worrying the tractor trade a good deal just now. The farmer expects more or less free service, because he figures that if he cannot make the tractor go there must be something wrong with it and it is "up to" the manufacturer or the latter's representative to "make good." The dealer feels that with current rates of discount he cannot give much in the way of free service. He has his organization to maintain and his establishment to keep up, and after all neces-

sary expenses are deducted there remains only a trifling profit. He realizes that service is necessary to keep the tractor at work and that the farmer expects him to give much of this service free of charge, yet he feels that he cannot give such service and still earn a reasonable profit.

The service situation would seem to afford an excellent opportunity to the Tractor Manufacturers or the Implement Manufacturers' Association to standardize practice regarding this matter. Without some standardized rule it will not be long before one manufacturer is played off against another and there will be keen rivalry among them in regard to the amount of free service promised. The logical solution of the problem would seem to be to discontinue all free service. The farmer must pay for the service in any case, so why shouldn't he pay in accordance with the amount of service he requires? So-called free service is apt to render him careless and unreasonable in his demands on the dealer's time. If he knows that he has to pay for every trip made by the dealer on his behalf he is likely, when something doesn't work right, to cudgel his brain before calling for help, but if he is given the impression that free service is included in the sales price, why shouldn't he take advantage of it?

For the growth and success of the tractor industry it is necessary that adequate service facilities be provided, but it is not by any means necessary that service be furnished free of charge.

Readjustment of Values

THE automobile industry evidently is feeling its way slowly through the uncertain period of readjustment. What we are passing through is really a period of changing values. Although it is quite certain in which direction the adjustment of values will proceed, no one can tell how far it will go and when it will be over.

All business planning is based upon an intelligent forecast of conditions of supply and demand, which regulate prices, and it has seldom been so difficult to make such forecasts as it is now. There has been much talk of "war prices" and "adjustment to peace conditions" and buyers naturally assume a waiting attitude. No dealer will load up with stock in a receding market and the ultimate consumer also is prone to hold aloof as long as there is a chance for a further drop.

There are indications, however, that those who are waiting for a big slump are doomed to disappointment. The present situation has nothing in common with a business depression following a financial panic. Stock quotations may tumble over night, the reason for such disastrous slumps usually being that the values at which the stocks were being held and sold were not in them. Practically all the value in industrial products represents labor spent upon them. The price which must be obtained for articles of manufacture depends upon their manufacturing cost and this in turn depends upon the cost of labor. It is quite true that the cost of labor has gone up very much during the war, and there is no doubt that eventually it will come down again. This adjustment, however, can be only very gradual, as the cost of living is bound to remain high for some time, and probably for years.

Meanwhile business must go on. Certain risks connected with the possibility of depreciation of materials must be willingly incurred, as they are of little importance compared with the great losses that would result from the stagnation of the industries. There is no ground for a pessimistic feeling. The present situation did not come unexpectedly. We all realized long before the war came to an end that the period of readjustment would bring with it certain disturbances in our commercial life; but just as certain as was the advent of these disturbances is the fact that once we become attuned to the new condition of things we will enter upon a period of great industrial activity and prosperity. A country that can produce 20,000,000 tons of foodstuffs a year in excess of its own requirements, besides large surpluses of staples, metals, fuels and chemicals, need never lack prosperity for any extended period.

Commercial Airplanes

ALTHOUGH little is being heard on the subject, a large amount of feverish activity is being developed in different parts of the country, particularly in Detroit, Cleveland and Dayton, in the low-priced airplane field. There are a large number of able men who have pinned their faith on the early arrival of the commercial airplane. These men have not only expressed an opinion but have staked their futures on the development.

The announcement of a prominent motor car company to the effect that it will have a production airplane to sell at $15,000, to be marketed through its dealers, is the first step in the direction of what may become a very important branch of the automotive business. The future plane will sell for less than $15,000, however, and it will not be until planes sell for $1500 that they will really be considered a commercial product.

The wings of the future plane will be removable or folding so that the entire machine can be packed in small space and put in a garage back of the house in the same way that the automobile is now kept. It must have a landing speed of not more than 45 miles per hour and probably not more than 35 miles per hour. Its engine must be simple, easily taken care of and of inexpensive manufacture. At first thought the idea of a low-priced airplane engine seems rather far-fetched, but there are developments in this direction which have already made successful runs. In the not distant future there will be airplane engines which can be manufactured for a few hundred dollars.

The next two years will see developments along lines which the war never suggested, because the planes required for military service were so different. Nevertheless, these light, low-priced yet well-built and safe little planes are surely going to be the next transportation development.

Latest News of the

Draw New Bill to Validate "Informal" Contracts

Measure Prepared by War Industries Board Has Support of M. A. M. A. and the Industry in General—Provides for Appeals Commission—Prompt Action Urged

WASHINGTON, Jan. 21—The Senate Military Affairs Committee to-day reported out a bill for the payment of informal contracts. Early passage is expected. The bill reported is the one drawn up by the War Industries Board and is supported by the United States Chamber of Commerce, the Motor and Accessory Manufacturers Association and industries generally.

As printed herewith, the bill for the payment of informal contracts reported by the Senate Military Affairs Committee with an amendment differs radically from the original bill proposed by the War Industries Board and approved by the United States Chamber of Commerce, the Motor and Accessories Manufacturers' Association and other industrial bodies.

The new bill includes a section by which for the first time in the history of the United States Government one department is authorized to investigate every act of another department. The Department of Justice is authorized by the bill to examine and investigate all of the contracts which have been made by the War Department. This is an objectionable feature in the bill because it is expected to considerably delay payments.

The bill also contains a new amendment authorizing the Secretary of the Interior to pay contracts not legally executed and others which call for the production or appropriation of ores, metals, minerals and mineral substances needed for war purposes.

It is expected that this bill, with the amendment, will be discussed on the floor of the Senate to-morrow. Considerable delay is again anticipated before passage of a relieving measure, due to the constant additional amendments and changes which are being made in each bill offered. The various industrial bodies fear that unless an equitable bill is passed, and passed promptly, there will be serious business difficulties, critical labor conditions and important obstacles to the success of the next Liberty Loan resulting. Following is the bill:

AN ACT

To provide relief where formal contracts have not been made in the manner required by law.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That whenever during the war emergency and prior to Nov. 12, 1918, any individual, firm, company, corporation, or foreign government has made an agreement with the Secretary of War, or with any officer or agent acting under his authority, or with any agency of the Government authorized to procure or aid in procuring the same for the War Department, for the production, manufacture, sale, acquisition or control of equipment, materials or supplies, or for services, or for facilities, or other purposes connected with the prosecution of the war, and such agreement was reduced to the form of a contract or accepted procurement order and executed or signed on behalf of the Government, but the agreement did not comply with statutory requirements, in every such case the Secretary of War is authorized and directed to waive, on behalf of the Government, such noncompliance: Provided, That he finds such waiver is not inconsistent with the public interest, and in this event the said agreement shall have the same validity and effect it would have had if such statutory requirement had been complied with.

That whenever, prior to said Nov. 12, 1918, any individual, firm, company, corporation, or foreign Government has made any agreement, oral or written, express or implied, with, or has received any order or request, oral or written, from the Secretary of War or any officer, agent, or agency as aforesaid, for any of the purposes aforesaid, and the same has not been reduced to contract form, but such individual, firm, company, corporation, or foreign Government has in good faith made expenditures, incurred obligations, acquired or furnished facilities, equipment, materials, or supplies, or rendered services, in reliance on such agreement, order, or request, in every such case the Secretary of War is authorized and directed, on behalf of the Government, to enter into such contract with such individual, firm, company, corporation, or foreign Government as will, under all the circumstances, fairly and equitably compensate him or it for the expenditures made, obligations incurred, equipment, materials, or supplies furnished or acquired, or services rendered, as aforesaid: Provided, That in no event shall such contract provide for compensation on terms more favorable than the terms, if any, for which the aforesaid agreement, order, or request may have provided.

That whenever, prior to said Nov. 12, 1918, the War Department, through its officers or agents, has taken possession of any land, or whenever the holder or owner of any land has removed from or removed any improvements from such land at the order or request of the War Department and no valid contract has been made with respect thereto, then the Secretary of War, if he finds that the public interest does not require the possession or occupancy of such land by the Government, is authorized to make compensation to the owner or holder thereof for the fair value of such improvements so removed and the expense incurred by such owner in removing therefrom or for the fair value of the use of such land of which the War Department has taken actual possession and for any expense or loss incurred by the owner or holder by reason of such possession.

SEC. 2. That a commission is hereby created and established, to be known as the War Contracts Appeals Commission (hereinafter referred to as the commission), which shall be composed of three members, who shall be appointed by the President, by and with the advice and consent of the Senate, and shall continue in office for one year from the date of this Act. One member of the commission shall represent the War Department, one member shall represent the Department of Justice, and one member shall represent the business interests of the country. None of the members of the commission shall be interested in any order, contract, or agreement within the purview of this act or have any interest in any firm or corporation having such orders, contracts, or agreements. Each member of the commission shall receive a salary of $7,500 a year, payable in the same manner as the salaries of judges of the courts of the United States. The commission shall choose a chairman from its own membership and may appoint a secretary, who shall receive a salary not exceeding $5,000 a year, to be determined by the commission and payable in the same manner as the salaries of the members of the commission.

That there is hereby appropriated, for the purpose of defraying the reasonable expenses of the commission, including the payment of salaries herein authorized, out of any money in the Treasury of the United States not otherwise appropriated, available immediately and until expended, the sum of $50,000.

That within thirty days of the date when the Secretary of War tenders any contract or compensation as provided in this act, or refuses to tender such contract or compensation, the party to whom said contract or compensation is tendered or refused, or the Government by a dutly authorized officer from the Department of Justice may file with the chairman of the commission a notice of appeal: Provided, however, That if the representative of the Department of Justice agrees with the action of the War Department there shall be no appeal by the Government, but settlement can be made at once. Thereupon, the commission shall proceed to examine and review the facts and circumstances of the case and make its award or finding thereon. Upon giving receipt in full of all demands against the United States arising out of the transaction by reason of which the award is made, the appellant shall be entitled to receive the amount of any award so made, and the proper officer of the United States is hereby authorized and directed to pay the same, but if the appellant is dissatisfied with the amount so awarded he shall be paid 75 per centum of the amount awarded and shall be entitled to sue the United States in the Court of Claims to recover such further sum as added to said 75 per centum shall make up such amount as will be fair and just compensation as provided in this act, and the Court of Claims is hereby given jurisdiction to hear said suit and render judgment therein.

That whenever any dispute arises in the matter of the adjustment or settlement, or as the interpretation or application of the terms of any contract which has been made for any of the purposes set forth in this act, and in the execution of which there has been

More Room for Airplane Show; Dates Now March 1-15

NEW YORK, Jan. 21—The aeronautical show which is to be staged by the Manufacturers' Aircraft Association has been considerably enlarged in scope, and the time of the exhibition extended from one to two weeks. Due to inability to get Madison Square Garden for the original dates, the time for the show has been altered from Feb. 26-March 6, to March 1-15. Because of the extent of the exhibits which the military and naval air services wished to have on view, it has been found necessary to use the Sixty-ninth Regiment Armory in addition to the Garden. No allotment of space has been made as yet, though it is expected that these details will all be worked out within the next few days. It is likely that the admission charge will be 50 cents.

Automotive Industries

Federal Supervision of Supply Sales

Definite Plan Adopted Covering All Sales of Government-Owned Property

WASHINGTON, Jan. 20—Close co-operation between the Government and industry, generally, in the sale of surplus Government supplies is planned by the Director of Sales of the War Department and the War Service Executive Committee of American Industries. The War Service Committee, which was named at the recent meeting of the Chamber of Commerce of the United States, will be consulted in all instances by C. W. Hare, Director of Sales, whenever sales are to be made in a volume that is likely to disturb trade conditions.

The first important sales to be made by the Government are of machine tools. Arrangements for the disposition of machine tools, made following a conference between the industry and the War Department, include plans by which the industry will absorb Government-owned machine tool equipment without serious disarrangement. The following agreement satisfactory to both the War Department and the machine tool industry was drawn up and will be followed:

The inventory of all machine tools and equipment which is being made will be expedited to the greatest possible extent.

As soon as it is known that a quantity of machine tools is available for disposal, the manufacturers of these tools will be given an opportunity to purchase them at a price and on terms of settlement which will be satisfactory to all parties concerned.

In case it is impossible for the manufacturer to purchase his product outright, an effort will be made to arrange for the marketing of the product by the manufacturer, in an equitable manner, securing for the Government and the manufacturer alike the best possible terms.

In case both these methods of disposition fail, the material will be offered for sale to the general public in a manner prescribed by law.

In settlement of plant contracts, which involve the sale of large groups of various kinds of tools and equipment, an effort will be made to prevent the sale for resale of any equipment, as it is realized that considerable injury might be done by indiscriminate sales of this character.

New Plans for Lincoln Motors

DETROIT, Jan. 20—A well-defined and semi-authentic report current of late in automotive circles is that the Lincoln Motors Co. plant is being prepared for the manufacture of an 8-cylinder motor car. It is known that an experimental car has been on the road, but it is stated on good authority that this design has been superseded. It is understood that engineers are working on engine plans and that a set of blueprints has already been completed. The plant had a $60,000,000 contract for 16,000 Liberty engines. This contract, partly filled, was superseded recently by another contract, cutting production to a minimum, which will bring operations almost to a standstill in the course of the next few weeks.

Apperson New Standard Model

KOKOMO, IND., Jan. 20—The Apperson Bros. Automobile Co. has brought out a new model which is to be known as its Standard model and which is to sell for $2,600. This is in addition to the Anniversary model, which sells for $4,000. The Standard model is equipped with the regular Apperson 8-cylinder engine, has a 130-in. wheelbase and will carry seven-passenger touring and four-passenger bodies. It is finished in thistle green.

Ford Now Making 1000 a Day

DETROIT, Jan. 20—The Ford Motor Car Co. is now producing 1000 cars daily, but before it can commence upon its 1919 production schedule, which calls for 3000 cars a day, over $1,000,000 worth of machinery, installed for war work, must be removed, replaced or scrapped, and several buildings readjusted to handle peace instead of war production. The big plant is working night and day on reconstruction work, but officials assert it will be 90 days before production can regain its pre-war level.

The Ford fiscal year ends July 1. Because of delay caused by the necessity of re-adjustment, the company does not expect to make more than 300,000 cars between January and July. The fiscal year of 1919-1920, they predict, however, will see production reach $1,250,000. The company has enough orders ahead to keep the plant in operation nearly two years.

Drop in Gasoline Price Expected

WASHINGTON, Jan. 22—A considerable drop in the price of gasoline is expected in the near future as a result of the United States Shipping Board's action in turning back 145 tankers which had been commandeered for war purposes and which are now returned to their owners. The majority of these vessels will be employed soon to transport oil to this country from Mexican fields. The total dead weight tonnage of the ships returned to their owners is 1,140,000.

Beecroft Now Due Feb. 1

NEW YORK, Jan. 23—Due to a hold-up in the sailing of the steamer Adriatic, the vessel will not reach New York until Feb. 1. Hence, David Beecroft, directing editor of the Class Journal Co., who was scheduled to arrive Jan. 27, will reach New York until a week later.

Deeds Is Completely Exonerated

War Department Board of Inquiry Finds Him Not Guilty of Court-Martial Offense

WASHINGTON, Jan. 16—Complete exoneration of Col. E. A. Deeds, head of the Dayton Electric Laboratories Co., and a member of the U. S. Air Service, has resulted from an investigation by a special War Department Board of Inquiry. Col. Deeds was recommended for trial by court martial by Charles E. Hughes in his report on aircraft production, which charges that Col. Deeds had given out misleading information with regard to production. Secretary Baker announced yesterday that he approved the findings of the Board of Inquiry and the case is completely closed.

The findings of the Judge Advocate General were submitted together with a letter by Secretary of War Newton D. Baker to the Chairman of the Committee on Military Affairs of the House. Secretary Baker's letter states that Col. Deeds, absorbed in the activities of aircraft production, neglected to attend to personal transactions and this neglect created appearances which these findings show in their true character.

The findings deal completely with all of the correspondence relative to the charges against Col. Deeds and include letters and telegrams showing that Col. Deeds was reluctant to accept a Government position because of his airplane interests, but that he did so at the urgent request of both Howard E. Coffin and the Secretary of War. Perusal of all of the telegrams which passed between Col. Deeds and the Dayton companies shows, it is said in the findings, that the colonel "zealously tried to protect the best interests of the Government." "It must be remembered," says the findings, "that at the time Mr. Deeds received his commission he was in Washington and not in Dayton where his business interests were located, and he could not reasonably have been expected to attend to the details of the stock transfers himself and did not attempt to do so."

With regard to the accusation that Col. Deeds uttered exaggerated public statements about aircraft production last spring, it is shown in the testimony that although the colonel testified that he had seen the publicity prior to its publication, he had actually not seen those parts which contained the erroneous statements. Regarding this matter the Judge Advocate General states: "It is recommended that no court-martial proceed-

Ships, Credit, Cables for Brazil Trade

These Are the Things Principally Needed to Develop Trade with America

WASHINGTON, Jan. 17—The establishment of American banks, long credit, fast passenger and freight service, independent cables, and the development of port and harbor facilities in Brazil by American capital are recommendations among others made by Capt. C. T. Vogelgesang of the U. S. Navy in a special report to the Secretary of the Navy. Capt. Vogelgesang went to Brazil to study the measures that will cement relations between that country and the United States. His report includes the following:

"Brazil desires a closer relationship with the United States. They want more American banks run according to the United States banking system. They want our credit and our capitalists to extend it to them in unstinted measures, for supporting that credit Brazil can offer an incomparable wealth of resources.

"But first of all, and above all, we need direct communications. Few people are awake to the value, the actual indispensability of direct communication between peoples who are trying to do business with each other, and the overwhelming disadvantages that underlie indirect and intermittent communication.

"As important as is the need of using our own carriers to dispense our goods throughout the world, it is of equal importance that we should link up our own cables to those countries with which we seek to do business, instead of having to depend, as we do now, upon the use of foreign cables, which, while not perhaps owned by foreign governments, are certainly administered in the interest of the nationality owning them to the detriment of alien clients and alien business.

"We cannot achieve economic freedom or count upon fair play in the game of international trade so long as we are tied down to a system of doing business through foreign banks and over foreign cables. In this connection it is interesting to speculate upon the possibilities of aerial mail communication from the United States to South America. Although but a few months have elapsed since this method of communication has been tried in the United States, it has already passed the experimental stage and is an unqualified commercial success. It will take no stretch of imagination, with this fact in mind, to see within a short time an aerial mail service connecting Washington or New York with Rio de Janeiro.

"The United States radio service, while it can never supplant cable service, will unquestionably supplement that service and become a most valuable commercial asset.

"In the development of a closer relationship we Americans may be assured that Brazil will do her part if we will do our part. The problem is for us to solve, because it takes capital to solve it. We have the capital and Brazil has not. We have her abundant good will and confidence and we can maintain that unimpaired by square dealing.

"The lines along which our capital may be best employed are the following in their order of importance as I view the situation:

"1. An independent American cable direct from New York to South America.

"2. More American banks and long credit.

"3. Fast passenger and freight steamer lines to Brazil, run on fast and regular schedules, and strictly first class in every particular.

"4. Development of Brazilian railways. Brazil's need of railways is as great as the need of China in that respect.

"5. Development of port and harbor facilities and coastwise commerce.

"6. Development of mining regions containing illimitable wealth of ores of all kinds.

"7. Development of industrial plants for the manufacture of material needed locally and for which raw material and water power exist in abundance and for which skilled labor will have to be supplied.

"The field is at this time wide open to energy and enterprise, and if United States capital, backed by a strong and enduring policy of Government support does not avail itself of the golden opportunity that is now presented, foreign capital will control, and we will not have established that community of interest that Brazil looks for in her relations with us."

Philippine Imports Limited by Amounts Obtainable

WASHINGTON, Jan. 20—Imports of automobiles and parts in the Philippine Islands in 1917 were limited by the amount obtainable, according to a Commerce Report made public here to-day. Cars totalled 1,540,401 as compared with 1,352,572 in 1916. The year 1917, adds the report, brought the foreign commerce of the Philippine Islands to its high-water mark, and developed the internal trade to a maximum. The growth of business in the islands is founded upon the staple production of the country. Agricultural, commercial and industrial pursuits have increased several hundred per cent in the past few years. Trade has grown particularly with Japan and China, while it has declined with Great Britain, France, the Netherlands, Italy and Switzerland. It has increased more than 72 per cent in the past year with the United States. The hemp industry retains its leading position, although exports of sugar, tobacco, lumber, pearl and cocoanut oil have increased promisingly. A lack of shipping facilities has been one of the greatest obstacles to a still greater import and export business.

Exports to Mexico Simplified

WASHINGTON, Jan. 18—Applications for export licenses to Mexico are no longer required to have attached thereto an order from the consignee bearing the visé of an American consul. The War Trade Board announced Jan. 16 that such procedure in connection with shipments to Mexico is no longer required.

This simplification will expedite shipments to Mexico by enabling the shipper to get his license more quickly, and will result in getting exports under way without the delay incidental to the procedure of awaiting consular communication.

Manganese Import Restrictions Lifted

WASHINGTON, Jan. 18—Restrictions on the importation of manganese ore or manganese dioxide from Asia and Australasia, and upon the importation of chrome ore or chromite, or copper ore and copper concentrates from any country are lifted completely by the War Trade Board. All restrictions on the importation of iron ore are removed. Applications for the importation of ferromanganese from Great Britain covering shipments contracted for by American consumers prior to April 6, 1917, will now be allowed. The affidavit of the importer, or written statement from the consumer, of the existence of the contract will be considered sufficient.

Belgium Is Ready for Business

Minerva, Pipe and F. N. Have Plans Made—To Produce in Few Months

PARIS, Jan. 1 (Special Correspondence)—The Belgian automobile industry has already laid its plans for a return to working conditions. Three of the leading factories, Minerva at Antwerp, Pipe at Brussels and F. N. at Liege, hope to get into production within a few months. The Metallurgique company at Marchienne-au-Pont states that it has machinery in storage ready to be shipped and installed, and that production will begin at very short notice.

The Belgian Government has decided to divide among the leading Belgian automobile manufacturers 5000 army trucks and automobiles, and also to distribute among them all the automobiles, motorcycles and bicycles captured from the German army. A portion of the army supply of machine tools and factory equipment will be distributed among the automobile factories. It is intended to distribute raw material in the same manner.

All the Belgian automobile factories have been stripped by the enemy. In some cases the machinery was sent directly into Germany; in other cases the enemy waited until it was evident that Belgium would have to be evacuated before removing everything.

Before the war Belgium had twenty-three automobile factories and produced about 10,000 cars a year. Very few trucks were built. There was only one tire factory—the Englebert, at Liege. In 1914 the German army took charge of this and turned it over to Engineer Tischbein of the Continental Tire & Rubber Co., of Hanover. The Germans immediately requisitioned one million dollars' worth of tires and raw material, and a little later seized most of the machinery. The factory was kept going on a small scale for the last 3 years of the war making waterproof clothing for the civilian population.

High Import Duty and Gas Price in Way of South American Business

BUENOS AIRES, Dec. 5 (By Mail)—The price of the gasoline said to be on hand, and the high rate of duty probable on motor importations, it is feared may limit the South American import business. It is claimed that there is still four to six months' supply of gasoline here, although there are no definite proofs either affirmatively or to the contrary. The price has not been raised recently, but the charge at the pumps in this city is 38 cents per liter, or about 62 cents per gallon, while all through the interior they are paying practically double this price, and in some instances even three times. The restrictions on purchasing are many, and there is a great deal of speculation.

A law is now proposed to raise the duty on motor cars and accessories. While this law has not been acted on as yet, the general opinion is that it cannot fail to pass, and will be in effect in a very few months. Up to February, 1918, motor cars and accessories paid a duty of 10 per cent on their value. From February to the present date they have paid 32 per cent. Now it is proposed that the duty shall be raised again so that they will pay 47 per cent in 1919. This will undoubtedly cause a serious decrease in importations, as the price to the public will be almost prohibitive.

—

Opportunity For South African Export

WASHINGTON, Jan. 20—Shortage of shipping and the difficulties of obtaining cargo space hampered the automobile trade of Johannesburg, British South Africa, according to a report by the vice consul, during 1917, but notwithstanding, business was fairly well maintained.

This is important from the viewpoint of the American manufacturer, for South Africa has now become an outlet of consequence for this export trade.

The gross value of the imports of motor vehicles, accessories, tires, gasoline, etc., increased from $8,594,200, in 1916, to $9,948,080, in 1917, or about 15¾ per cent. However, the advanced prices of all these goods indicate a higher aggregate cost rather than a larger volume of business. Imports from the United States amounted to $5,279,943, or 53 per cent of the total; and the United Kingdom furnished $1,872,639, or 19 per cent. In 1916 the percentages were as follows: United States, 55 per cent; United Kingdom, 24 per cent; and other countries, 21 per cent.

The average declared value of the English automobile amounted to $1,144, while the approximate value for custom purposes of the American and Canadian car was $779 and $438, respectively. The latter has grown greatly in popularity in recent years, and imports from Canada rose 71 per cent, compared with those for 1916. On the other hand, imports of automobiles from the United Kingdom decreased 45 per cent, or from $325,218 to $178,805; and the figures for the United States fell from $2,717,051 to $2,525,881 for the same period.

A decrease of 16 per cent was noted in the gross value of motorcycles and parts imported into this district in 1917, compared with the preceding year. The United Kingdom lost its supremacy in this market to the United States, imports from which were valued at $352,865, or 53 per cent of the total.

Tires were supplied to the value of $1,374,227 by the United Kingdom, which still continued to be the principal source of supply with 53 per cent of the total imports to its credit. Imports from the United States increased from $692,114, in 1916, to $705,681, in 1917, and a material gain resulted to French and Italian manufacturers, imports of their goods increasing by 71 per cent compared with the figures for 1916.

The motor trade of the Union has now reached such a stable state that it is capable of absorbing annually imports of considerable value. It will no doubt grow in volume and importance because the isolation of certain districts cannot be eliminated altogether by railroads. Heretofore, railway facilities have been practically the only means of communication between distant settlements, and regular motor traffic would tend greatly to hasten the industrial development of districts whose progress has been retarded in the past.

—

Foreign Trade Opportunities

WASHINGTON, Jan. 20—A man in France desires an agency for motor car bodies, trimmings, etc. Further information can be secured from the Bureau of Foreign and Domestic Commerce by mentioning Foreign Trade Opportunity No. 28087. A firm of Chinese merchants in Trinidad desires an agency for the sale of motor cars and rubber tires. No. 28095.

November Exports from New York

Satisfactory Increases in Cars and Trucks—Parts Drop Nearly 60 Per Cent

NEW YORK, Jan. 21—November exports of automotive products from this port are much more satisfactory than might be expected. There is no doubt but that the switching of a large number of ocean-going ships for service in transporting the foodstuffs still needed in great quantities overseas has tied up our commercial shipping to a very great extent, but, nevertheless, our exports of cars during the month totalled 806, valued at $1,003,416, as against 557, having a value of $735,558, during October.

Our November exports of trucks were 549, valued at $1,733,489, as against 328, valued at $1,057,003, in October. Parts (excluding engines and tires) show a serious falling off, the November value being but $593,414 as against October's $1,473,655. Tires, which appear in this tabulation for the first time, represent a normal month's export trade.

In the order named, the principal buyers of passenger cars during November were British South Africa, Uruguay and Japan. France was by far the best customer for trucks, Japan taking second place. During November there were also exported from New York alone 181 motorcycles, valued at $46,050, and 35 gasoline automobile engines, having a value of $3,242.

—

Garages to Secure Ford Parts from Dealers

DETROIT, Jan. 20—The Ford Motor Co. is handling the selling of Ford parts to garages through its authorized dealers, and not through the factory. Announcement of the plan of the Ford Motor Co. to sell its parts directly to garages has created a number of inquiries and orders to the factory and factory branches direct. The company, however, states that it prefers that the sale of Ford parts to garages be handled through its regular authorized dealers, instead of being shipped direct from the nearest branch.

Suit Against Jobbers Slow-Moving

First Witness Heard Tells of Operation of So-Called Syndicate Catalogs

NEW YORK, Jan. 20—The trial of twenty-one members of the Jobbers' Association is showing a little more interest and speed this week than it did last week. It opened last week with George Woelfel, Jr., Commissioner Webster's former secretary, on the stand, and the various prosecuting attorneys reading great masses of documentary evidence.

In the opening days the jobbers were quite encouraged when Judge Hand, who is an old timer in the United States District Court here, showed a disposition to speed things up. He repeatedly asked if it were necessary to bring in all the masses of documents that the Government attorneys presented. And when one of them proposed to read some 1400 letters into the record the judge flatly refused to listen to them. He also jogged the defense at times and seemed anxious to get the case over with. Estimates of the period run from a month to six weeks.

The court scene is anything but exciting, and at times the spectators' benches contain only two or three. To-day, however, when things began to liven up, there were twenty-five or thirty spectators.

Most of the evidence during the "literary stages," when documents were being read, seemed to be to establish some of those facts which are well known to the trade, such as the formation of the association, the passage of resolutions and the existence of the "jobbers' list."

To-day, however, real witness' stories were heard. The first on the slate this morning was G. A. Smale, who operates the Catalog System Co. in Wilmette, Ill. He told of the association's resolution which frowns on the use of syndicate catalogs. The substance of his story was that he protested against this resolution to various individuals and at two different meetings, but to no avail. He said also that thereafter quite a long list of former customers declined to take space in his catalogs, giving as an excuse the association's resolution.

The cross examination by the association's counsel tended to show that Smale showed only those goods whose makers paid him money for space, that he did little investigating as to the status of those who bought space and catalogs, that he sold the catalogs, imprinted with the buyer's name, to anyone who would pay for them, that he imprinted on the front cover any copy the buyer supplied, and that this tended to cause many "illegitimates" to secure jobbing rates on merchandise to the general disadvantage of the whole trade.

These catalogs, it was developed, did not contain a complete list of the trade's goods, but simply a list of the goods of those makers who paid to get in. This fact, however, was not, as a rule, explained to those dealers and jobbers who bought the catalog for use among their trade.

He distributed over 100,000 copies a year to more than 100 customers at from 5 to 10 cents each and charged the manufacturers about $1.50 per page per thousand. Charles E. Miller was on the stand for a few minutes, but didn't stay long. He may be called again.

And then came Clement M. Biddle of "Biddle's Purchasing Agency." He said his company rendered a service in giving daily price changes and other information and catered to the jobbers in the hardware, iron, steel, plumbing supplies, grocery, metals and automotive equipment trade.

Biddle's story related to the association's resolution to the effect that there is no field in this trade for a purchasing agency, and he endeavored to show that his business is of service and that the resolution is unjust.

Crow-Elkhart Settlement

SOUTH BEND, Jan. 22—At a meeting of the representatives of the Crow-Elkhart Motor Car Co. it was practically decided to accept a settlement of 25 cents on the dollar. This decision is not to go into effect immediately. The total liabilities of the company are $330,000.

Bruce Daniels Joins Seeds

INDIANAPOLIS, IND., Jan. 20—Bruce Daniels, in charge of advertising for Prest-O-Lite Co., has resigned that position to join the staff of the Russel M. Seeds Co., an advertising agency. For the last eight years he has been closely identified with the motor industry. Originally automobile editor of the Indianapolis *Star*, he has successively been in charge of the Motor Car Manufacturing Co., the Stutz Motor Car Co., and was for the last five years with the Prest-O-Lite Co.

McLaughlin-Buick Price Down

OSHAWA, ONT., Jan. 21—The McLaughlin Motor Car Co., Ltd., of Canada, which is the Canadian representative of the Buick Motor Co., and which assembles and sells the standard Buick models under the name of the McLaughlin-Buick, has reduced car prices as follows:

H-62 Roadster, $1,500; H-62 Special, $1,545; H-63 Touring, $1,500; H-63 Special, $1,575; H-62 Coupe, $2,075; H-63 Sedan, $2,225; H-44 Roadster, $1,925; H-44 Special, $2,050; H-44 Extra Special, $2,090; H-45 Special, $2,050; H-45 Extra Special, $2,090; H-46 Coupe, $2,625; H-49 Seven Passenger, $2,365. All prices, however, are subject to war tax.

Chicago Office for Warnock-Wirth

SIOUX CITY, Jan. 22—The Warnock-Wirth Sales Co. has located its department of sales at 624 S. Michigan Avenue, Chicago, under the management of C. H. Scribner.

Bosch Magneto Is Reorganized

The American Bosch Magneto Corp. Takes Over Entire Plant of Old Company

NEW YORK, Jan. 23—American Bosch Magneto Corp. is the new name of the entirely reorganized Bosch Magneto Co. which on Dec. 7 was sold by Alien Property Custodian A. Mitchell Palmer. Under the new regime, the Bosch company is 100 per cent American, and has as its officers the following: President, A. T. Murray, president of the Bethlehem Motors Corp.; vice-president and treasurer, George A. MacDonald, president of the Chicopee National Bank, Springfield, Mass.; vice-presidents, A. H. D. Altree and Leon W. Rosenthal; secretary and assistant treasurer, J. A. MacMartin. Directors: Geo. A. MacDonald; A. T. Murray; Martin E. Kern, president of the Penn County Trust Co., Allentown; Henry N. Sweet and H. B. Benedict, of Hornblower & Weeks, bankers; C. H. Dwinnell, vice-president First National Bank of Boston; H. C. Dodge, chairman of the board of directors of Gray & Davis; Duncan C. Holmes, vice-president of the Chase Securities Co.; Philip L. Spalding, president of the New England Telephone & Telegraph Co., Boston.

The new company has taken over the entire holdings and property of the old, including the Springfield plant and all American and foreign patents and trademarks under which the old company operated. At the time the plant was sold by the Alien Property Custodian it was operating practically to capacity on government work.

Goodyear Dealer Method Is Legal

NEW YORK, Jan. 23—The method of the Goodyear Tire & Rubber Co. in doing business with its dealers and in refusing to sell to those who will not maintain its resale prices is legal, according to a decision by Judge Hand, rendered late last week. H. P. Baran, a Goodyear dealer, filed suit against the Goodyear Tire & Rubber Co., claiming infringement of the Sherman and Clayton laws.

He alleged that Goodyear conspired to obtain a monopoly and restrain trade and commerce in their tires; that they selected the dealers who should sell their tires, forbade them to sell other dealers, and instructed them to sell only at the prices and terms fixed, under penalty of forfeiting their position as Goodyear dealers.

Counsel for the Goodyear company pointed out that the company's object was to protect the public and insure their getting maximum service from Goodyear products. Judge Hand ruled that the Goodyear method is legal, stating that the selected dealers could do as they pleased with the merchandise, that there was no agreement among dealers to fix prices or restrict sales, and that the principal point at issue was whether the Goodyear company was within its rights in attempting to prevent price-cutting by refusing to sell to dealers who did not maintain the suggested prices. No decision to which he was referred, said Judge Hand, "prevents a single trader from rejecting a customer because he did not like the prices at which the customer resold."

Packard Biplane at $15,000

Two-Seated Machine to Be Sold Through Dealers—Other Dealers Interested

DETROIT, Jan. 23—The Packard Motor Car Co. is shortly to place on the market a two-seated biplane which is to be sold through Packard dealers at a figure close to $15,000. The Packard Company, therefore, becomes the first manufacturers of passenger cars and trucks to take up, in a commercial way, the production of airplanes for general use.

The decision of the company to enter this new field is not altogether surprising in view of its experience in the development of an airplane engine of its own and of the intimate relationship between the Packard engineering force and the finished Liberty engine. It was largely through the efforts of Jesse G. Vincent, at that time vice-president of engineering of the Packard Company, that the Liberty engine was designed and brought to perfection.

Machines Ready in 30 to 60 Days

Beyond the fact that the machine is to be a two-seated biplane, little regarding the design and construction has been permitted to become public. It is expected that the first machine will be ready in from thirty to sixty days, and it is planned to supply them to dealers as rapidly as possible. Already the Chicago dealer has ordered one and other dealer organizations see in the machine a potential market composed of well-to-do sportsmen.

That dealers will take readily to the sale of planes, and that they believe in the possibilities of selling such machines is indicated by the fact that in both Milwaukee and Philadelphia, dealers have recently arranged to handle aircraft. George W. Browne, Milwaukee distributer of Overlands, is to take on the distribution of Curtiss machines, which are made by the Overland interests; and in Philadelphia, Isenberg Brothers have prepared plans and shortly will erect a building to be used for the exhibition and sale of heavier-than-air machines. The company will sell both new and used machines.

—

Banquet for "Rick" Feb. 3

NEW YORK, Jan. 23—Rickenbacker is coming back. He has already sailed, and in honor of his home-coming, the Contest Board of the American Automobile Association will tender him a monster banquet. It is to be held at the Waldorf-Astoria, New York, Monday, Feb. 3. Associated with the A. A. A. in the arrangements for the dinner are the N. A. C. C., the Automobile Club of America, the S. A. E., the M. A. M. A., the Aero Club of America, the New York Dealers' Association and the Aircraft Manufacturers Association. It is expected that 1000 will attend.

—

PARIS — Enlisted in the American Army as a first-class sergeant in early 1917, race driver Eddie Rickenbacker will sail for America in a few days with the rank of Captain and Squadron Commander, wearing the red ribbon of the French Legion of Honor, the highest military decoration which can be bestowed by France; with the French Croix de Guerre and three citations, with the American D. S. C. and seven citations, and a record of 26 German planes officially shot down in combat, this constituting the record of the American army.

U. S. Exports More Cars and Trucks

November Figures Show Gain in Vehicles and Drop in Parts

	Cars	Value	Trucks	Value	Parts
1918					
Nov.	2,226	$2,576,622	974	$2,709,362	$2,166,719
Oct.	1,708	1,881,462	737	2,192,556	3,700,687
1917					
Nov.	5,006	4,820,738	1,496	3,538,077	2,535,230

WASHINGTON, Jan. 22—So much is dependent on the amount of ocean shipping available and the conditions regarding gasoline and tires existing in a number of countries with which in more normal times we have steady and uninterrupted business relations, that it is obviously unfair to compare any one month's exports with those of another.

There is no doubt whatever that there are plenty of orders for automotive products from Europe, Asia, Africa, Australasia and Latin America, but it is equally true that in a greater or lesser degree United States manufacturers still experience difficulties in shipping promptly. It is also obvious that the demand for passenger cars is bound to fall off in countries where gasoline is either rationed or where no fuel at all is available. Happily, these conditions are mending rapidly. The figures given above and those contained in the table herewith are self-explanatory and disclose a satisfactory state when abnormal trading conditions are considered.

—

Saxon Back to Car Production

DETROIT, Jan. 21—The Saxon Motor Car Corp. is getting back to passenger car production.

Load Trucks with 3% Tax

Conference Committee Puts the Impost Back, But Lets Farm Tractors Off

WASHINGTON, D. C., Jan. 20—The Conference Committee of the Senate and House of Representatives has put back in the new War Revenue Bill a tax of 3 per. cent on commercial vehicles. The action of the committee was not altogether unexpected, for the vote of the Senate in eliminating the 5 per cent tax from the original bill was very close. Thirty-three voted for its elimination, as against twenty-eight for its retention in the measure.

In deciding definitely the tax for the motor trucks, the Conference Committee appears to have been guided by three principal ideas. These are:

1. That motor truck manufacturers were not really limited in their production prior to the signing of the armistice, but instead were permitted to expand considerably;
2. That during this period of only slightly restricted production and expansion, manufacturers made considerable money; and
3. That commercial motor vehicles have done much damage to the public highways, and are continuing to do so.

As the War Revenue Bill stands at present, it includes the tax of 5 per cent on the sales price of passenger cars, motorcycles, tires, spare parts and all accessories (the tax on tires and parts and accessories applies only when sold to other than a manufacturer) and 3 per cent on motor trucks. The proposed tax on farm tractors has been definitely eliminated by the Conference Committee.

Inasmuch as both the Senate and the House of Representatives have agreed upon a tax of 5 per cent on the sale price of passenger cars, it is practically a foregone conclusion that this impost will stand. The Conference Committee, in fact, has no authority to eliminate this tax because of its previous acceptance by the Senate and House.

Certificate Necessary for Norwegian Imports

WASHINGTON, Jan. 18—Exporters shipping to Norway must hereafter obtain advice from the prospective importer in Norway that an appropriate import association or the Norwegian Finance Department has issued a certificate permitting the import of the proposed consignment, before filing application with the War Trade Board here. The certificate must be either issued or confirmed subsequent to May 10, 1918. Inquiries regarding the Norwegian Import Association's regulations and their certificates should be addressed to the Norwegian Legation, Commercial Department, Washington, D. C.

All questions of Norwegian import control or difficulties relating thereto should be settled before filing applications with the War Trade Board.

In filing applications for licenses to ship commodities which are controlled by Norwegian import associations, the application must show as the consignee the association that issued the certificate, and the exporters are also required to state on applications the name of the person or firm in whose favor or on whose behalf the import certificate was issued; as, for example:

Consignee—Oil and Colour Merchants' Association, Christiania, Norway.

Purchaser Abroad—Here state person or firm to whom certificate was issued. Address of such person or firm.

Applications for licenses to export commodities which are not controlled by Norwegian import associations must be covered by a guarantee certified by the Norwegian Finance Department and further certified by an American consul in Norway. Shipments falling within this class may be consigned directly to the importer.

Sixth National Foreign Trade Convention in April

CHICAGO, Jan. 18—The National Foreign Trade Council will hold its sixth National Foreign Trade Convention at the Congress Hotel, on Thursday, Friday and Saturday, April 24, 25 and 26. The convention will deal with foreign trade as a factor in stabilizing American industry. It will take up problems involving the conversion of war industries to the needs of peace; development of our foreign trade to provide employment for our soldiers, sailors and war workers; and the formation of a definite policy dealing with shipping.

N. A. C. C. Meetings During N. Y. Show

NEW YORK, Jan. 20—The National Automobile Chamber of Commerce has two meetings scheduled to be held during the New York show period. The first of these will be devoted to passenger cars and is to be held on Feb. 5; the second will be devoted to commercial vehicles and will be held Feb. 11.

Canada Revises Truck License Fees

TORONTO, Jan. 18—The Canadian Department of Highways has put into effect a new scale of license fees for trucks. The change is a double one, both the fee and the basis for computing it having been revised. In the past 1 and 2-ton trucks have paid $10. For each additional ton they have paid a fee of $5. In the future $10 will be the minimum charge for a truck of 2 tons "combined weight and carrying capacity," which corresponds approximately to a 1-ton truck under the old method. For trucks exceeding 2 tons, weight and carrying capacity, there is a sharp increase. Up to 8 tons the extra fee is $5 a ton additional as formerly, but the actual amount paid will be increased by the new basis. On trucks of over 8 tons up to 10 tons the rate will be $7.50 per ton, and on all trucks of over 10 tons, $10 per ton.

Another change made in license fees makes the rate for the dealer's license and markers $20, the dealer having the right to use the markers on any car in his establishment apart from cars used for hire. This does away with the system that allowed a dealer to pay $10 for the license and original markers and $5 for each extra set of markers. That system was discontinued because of misuse of the extra markers.

Continue 9 Standard Tire Sizes

Rubber Association at Annual Meeting Decides Not to Revert to Former Schedules

NEW YORK, Jan. 17—The nine standard sizes of pneumatic tires which were evolved by the War Service Committee of the Rubber Association of America in conjunction with the Society of Automotive Engineers are to be continued. This was decided at the annual meeting of the Rubber association held at the Waldorf yesterday.

These nine sizes include both plain and non-skid treads in the following dimensions, all being straight-side type except the two smallest, which are clincher: 30 x 3½, 31 x 4, 32 x 3½, 33 x 4, 34 x 4½, 35 x 5 for passenger cars, and 36 x 6, 38 x 7 and 40 x 8 for commercial vehicles.

These are the sizes which the industry decided it could get along with during the war, eliminating all other of the 287 sizes which heretofore have been made. Now that the war is over, it has been decided that the benefits of standardizing on these sizes may well be perpetuated.

Nothing has been done as yet with regard to the continuation of the standard sizes of solid tires adopted soon after the pneumatic sizes were decided upon. This is a matter which is to be taken up at a later date. It was the consensus of opinion of the meeting that the solid tire standards be continued, though there may be some slight change in one or two of the sizes.

Prior to the meeting at which this action was taken the War Service Committee was formally disbanded, and to the Pneumatic Tire Division of the association there has been added a solid tire division, which is headed by A. G. Partridge, sales manager of the Firestone Tire & Rubber Co.

Homer E. Sawyer, vice-president in charge of the footwear division of the U. S. Rubber Co., was elected president of the association, other officers elected being: First vice-president, Harry T. Dunn (Fisk Rubber Co.); second vice-president, F. A. Seiberling (Goodyear Tire & Rubber Co.); secretary and treasurer, Harry S. Vorhis. Seven new directors were elected as follows: John F. Lowman (Philadelphia Rubber Works Co.), Seneca G. Lewis (Pennsylvania Rubber Co.), James Newton Gunn (U. S. Rubber Co.), C. W. McLaughlin (Mohawk Rubber Co.), John Morgan (McGraw Tire & Rubber Co.), G. W. Henne (Mansfield Tire & Rubber Co.), A. D. Thornton (Canadian Consolidated Rubber Co.).

Would Appropriate $600,000,000 for Roads

WASHINGTON, Jan. 18—The Senate Committee on Post Offices and Post Roads is considering an amendment to the rural post roads bill of 1916 which will appropriate $600,000,000 between

1919 and 1924 for development of the rural post roads. The amendment was offered by Senator Bankhead and calls for appropriations of $50,000,000 immediately, $75,000,000 July 1, 1919, $75,000,000 July 1, 1920, $100,000,000 July 1, 1921, $100,000,000 July 1, 1922, $100,000,000 July 1, 1923, and $100,000,000 July 1, 1924, to be used in the construction of highways under House Bill 7617, which was passed in July, 1916. This bill authorizes the Secretary of Agriculture to co-operate with the various state highway departments in the construction of rural post roads. The bill allows the Secretary of the Department of Agriculture to apportion funds to each state. The original bill appropriated $75,000,000 between 1917 and 1921 for this purpose. A large part of this sum—more than $60,000,000—is still available under the original act due to the delay in highway construction caused by the war.

Milwaukee Tire and Supply Men Organize

MILWAUKEE, Jan. 20—Tire and supply dealers of Milwaukee have organized an association for mutual benefit and to eliminate trade abuses of various kinds, notably promiscuous discounting. The new body is known as the Tire Dealers' Association of Milwaukee and officers have been elected as follows:

President, Russell L. Stephens, manager Republic Tire Co., 472 Milwaukee Street; first vice-president, George A. Brown, Brown's Tire Shop, 2428 Lisbon Avenue; second vice-president, Henry F. Stenzel, president and manager Milwaukee Tire & Supply Co., 457-459 Milwaukee Street; secretary, H. A. Packard, Standard Racine Rubber Co., Oneida and Jefferson Streets; treasurer, Lawrence J. Engel, Milwaukee Tire & Rubber Co., 456 Milwaukee Street.

Free Motor Mechanics' School for Chicago

CHICAGO, Jan. 21—A school for training motor mechanics is being established by the Board of Education of this city. It will operate on a continuation plan, the students attending two half days a week and the school being run continuously. It will be a trade school to train men and women in the proper maintenance and operation of motor cars, trucks and other automotive apparatus. Men from service stations, garages and repairshops are sought in particular. Those who conduct the motor car business here, it is said, are going to send employees from their service stations and repairshops to this school and will pay them while attending.

The school is to be located in the building which has been used by the government for training mechanics for the motor transport corps and mechanical divisions of the army. The plan for study includes English, drawing, mathematics, chemistry, physics and mechanics in general. Mechanics will include all units of the motor car. There will be classes in carburetion, ignition, starting, lighting, mechanics of the engine, of the transmission and the differential.

Gasoline Restriction Off in France

Motorists Can Now Buy All They Want at $1 to $1.20 a Gallon—Plenty on Hand

PARIS, Jan. 1 (Special Correspondence)—France removed all her gasoline purchase restrictions to-day and gave greater liberty to motorists than they have possessed since the beginning of the war. To purchase gasoline it is no longer necessary to apply to the police or the civil authorities; all that is necessary is the cash to pay for the fuel.

Since the signing of the armistice the gasoline supply has been fairly plentiful. The retail price is $1 to $1.20 per gallon outside the city of Paris. At the present time France has a stock of 90,000 tons of gasoline and 50,000 tons of kerosene. Shipments are being made into France at the rate of 90,000 tons per month, and it is expected that this rate will be maintained for a long time. By reason of the return of Alsace and Lorraine to France the country has secured at least 50,000 tons of gasoline per year from the Pechelbronn wells. These wells have been exploited by the Germans for the last four years.

Travel restrictions have not all been removed, but in the interior zone of France motorists can travel within a radius of 30 miles of their homes without any permits or formalities. Beyond this radius it is necessary to show a sufficient reason why the journey should be made by automobile. In the army zone automobile travel is still forbidden except to holders of a special pass issued by the military authorities. It is understood that these travel restrictions are only of a temporary nature. Except in the army zone, there is no sound reason for the 30-mile radius restriction; it is doubtful, indeed, if this law will be enforced with any amount of vigor, for France is too short of man power to place police on the roads for the purpose of holding up motorists.

The French Government is anxious to get the devastated regions thrown open to visitors as early as possible. One government department is working on this problem now, and is planning routes and arranging for the rebuilding of hotels, so that foreign visitors may be received in France this summer. As an indication of the spirit at work, preliminary arrangements have already been made for a huge motor and cycle tour through Alsace during the summer, probably in the month of August.

Price Effect of Oil Discovery in Texas

DALLAS, Jan. 21—Since the recent oil discovery in West Texas and the enormous production that is being made daily, it is generally predicted that within a few months the price of gasoline will be reduced. In fact in some places the price has already been reduced from ½ to 1 cent per gallon, and in Chicago there is a merry little price war between Texas and Standard. Many refineries are planned or are already under construction in the new oil field. Eight refineries have been erected at Wichita Falls and four at Ft. Worth. Others are to be erected at Abilene, Weatherford, Ranger and Dallas. The average daily production, in Burlburnett and Ranger alone, is said to be about 79,000 bbl. per day.

Highways Committee Formulates New Plans

WASHINGTON, Jan. 18—Post-war plans for highway development by the Highways Transport Committee are being completed. They include uniform state traffic laws and police traffic regulations; stimulation of food production by food distribution via motor truck; a survey of facilities available for highways, transportation and city marketing; transportation facilities for soldier farms, including movements to open up large tracts of grounds for settlements; development of transportation facilities for resources other than agricultural; co-operation with railroads and waterways taking in feeder extensions; coordination of highways transport with rail and electric line freight or express; standardization of highway shipping methods, and the placing of returned soldiers experienced in highways transport.

Campaigns for snow removal in the various states are being undertaken through the regional and district organizations. New Jersey has initiated definite plans for handling snow. Other states such as Pennsylvania, New York, Michigan and Ohio are working in co-operation with the Highways Transport bodies through the Highway Commissioner offices. Raymond Beck, field engineer of the committee, is compiling bulletins dealing with the causes of snow drifts, methods of prevention and methods of fighting snow and removing it. These bulletins will be distributed to the various interested agencies.

Employment of Returned Soldiers

BOSTON, Jan. 20—The problem of employing returned soldiers will be discussed by the automobile dealers at a meeting here next week. As the half-page advertisements urging them to re-employ soldiers did not meet with the approval of all the dealers, they have decided to have a conference on the matter. Many dealers have already taken back all the soldiers who have returned, and they will continue the policy as far as possible, regardless of any concerted action.

Johnson to Direct N. A. D. A. Road Work

ST. LOUIS, Jan. 20—Pike Johnson of Washington, who put over the highway transport movement in Colorado, has been made good roads representative of the N. A. D. A. He is at present engaged in good roads educational work and will supply any information desired.

Complete Program for S. A. E. Meeting

Annual Gathering Includes Four Professional Sessions, Ladies' Night and Dinner

NEW YORK, Jan. 22—The complete program for the forthcoming annual meeting of the Society of Automotive Engineers, which is to be held in the Engineering Societies Building Feb. 4-6, is now ready and printed copies are being distributed.

Prior to the opening professional sessions on Wednesday morning, Feb. 5, there will be a meeting of the Standards Committee on Tuesday, Feb. 4. Following the close of the professional sessions there will be a ladies' night on the evening of Feb. 5, a reception and dance being scheduled for the North Ballroom of the Hotel Astor.

On the following evening, Thursday, Feb. 6, the society's Victory Dinner will be held in the Grand Ballroom of the Hotel Astor at 7 o'clock. Job E. Hedges will be toastmaster.

After the dinner members and their guests will attend the Midnight Whirl at the Century Grove on the roof of the Century Theater. The S. A. E. has purchased the entire house. The complete program is given at the top of the next column.

PROGRAM FOR THE S. A. E. ANNUAL MEETING

Wednesday, Feb. 5

Tanks	Lieut.-Col. Herbert W. Alden
Automotive Ordnance Apparatus	William G. Wall
Principles of the Wheeled Farm Tractor	Edward S. Hewitt
Automotive Applications of Marine Engines in the War	George F. Crouch
Probable Effect of Aeronautic Experience on Automobile Practice	Henry M. Crane, Howard Marmon, O. E. Hunt
High Efficiency Automobile Engines	D. McCall White
Development of the U. S. Standard Military Truck	J. G. Utz

Thursday, Feb. 6

Symposium on Fuel	Dr. Joseph E. Pogue
Unmined Supply of Petroleum in the U. S.	Dr. David White
Present Status of Refinery Practice in the U. S.	Dr. E. W. Dean
Status of Engine Efficiency in the U. S.	Dr. H. C. Dickinson
More Efficient Utilization of Fuel	C. F. Kettering
Mexico as a Source of Petroleum and Its Products	E. De Golyer
Liberty Engine	J. G. Vincent
Fixed Radial Cylinder Engine	John W. Smith
Proportioning Airplanes to Their Engines	Lieut. Alexander Klemin
Making the Airplane a Utility	Grover C. Loening
Problems of the Naval Aircraft Factory	Commander H. C. Richardson, U. S. N.
Navy Dirigibles	Starr Truscott
Operation of Naval Aircraft	Commander J. H. Towers, U. S. N.

Bill to Validate "Informal" Contracts

(*Continued from page 226.*)

compliance with statutory requirements, the contractor or the Government by a duly authorized officer from the Department of Justice may give notice to the Secretary of War of intention to appeal to the commission, and provided notice of appeal is filed with the chairman of the commission within thirty days: Provided, however, That if the representative of the Department of Justice agrees with the action of the War Department there shall be no appeal by the Government but settlement can be made at once. On an appeal being taken the commission shall thereupon proceed to determine the questions at issue as set forth in said notice of appeal; and the contractor shall be entitled either to receive the whole amount of such award as may be made as in full of his claim on the questions submitted or 75 per centum of the same and sue the United States in the Court of Claims for any remainder, all as provided next above as to agreements otherwise within the purview of this act.

That in executing the duties and powers conferred by this act the commission may make its own rules and regulations and may hear and determine issues informally. It shall be the duty of the Secretary of War to furnish to the commission such evidence, documents, or papers pertaining to transactions as to which notice of appeal has been filed as the commission may request. The commission is authorized in its discretion to appoint an examiner in any region or district when such region is within the United States where in its judgment the taking of additional testimony is necessary to the determination of any case. Such examiner shall be a resident of the region or district for which he is appointed, and shall not have any interest, directly or indirectly, in any contract or transaction coming before him or receive any compensation save and except such per diem compensation and expenses as shall be fixed by the commission. Whenever the commission shall refer to any such examiner any claim presented hereunder, the examiner shall proceed, under the direction of the commission, to hear the parties, take the proofs, and return the same to the commission with his recommendations thereon as promptly as possible.

SEC. 3. That nothing in this act contained shall be held to validate any such contract unless the officer who was at the time of the making of such contract the chief of the division or bureau, as the case may be, in which said contract was negotiated, or in the event that such officer was not responsible for the making of such contract, then the officer in such division or bureau who was so responsible, together with the officer who signed said contract, shall each severally make and subscribe to an affidavit in writing, giving the definite terms of such contract, the name or names within his knowledge, of any such officer or officers who took part in the negotiation or making of the same, and stating whether or not within his knowledge any officer aiding in such making was interested, directly or indirectly, in said contract, and in addition subscribing to an oath to be appended to said affidavit in substantially the following form and tenor:

"I, ———, Chief of the Division or Bureau (naming it) in which the contract hereinbefore mentioned was negotiated, at the time of negotiation thereof, and the officer in the Division or Bureau (naming it) responsible for the making of the contract hereinbefore mentioned, and I, ———, the officer who actually signed said contract, do hereby each severally swear that I am not and was not at the time of the making of said contract directly or indirectly interested in said contract."

That in respect to any such contract as to which any one of said officers can not take the foregoing oath, or after diligent search or inquiry by the contractor cannot be found, or is at the time actually engaged in foreign service, or refuses to take said oath, then upon such facts and the fact required in the oath of such officer, appearing by an affidavit, of the contractor, or of one of its partners, chief officers or chief agents acting in its behalf, the Secretary of War shall promptly report such contract to the War Contracts Appeals Commission, and furnish to said commission such evidence, documents, and papers pertaining to the transaction as may be within his control, and such commission may request, and original jurisdiction is hereby vested in, said commission to hear and determine said claim with the powers and upon the procedure hereinbefore described in this act. Said commission shall make its award or finding thereon, and deny said claim or grant it in whole or in part, according to the justice and equity thereof, and the award or finding shall have the same force and effect, and create the same rights as if made under the provisions of section three of this act. And it shall be the further duty of said commission in hearing, investigating, and determining such claim to find and determine whether any of such officers is or was at the time of the making of said contract directly or indirectly interested in said contract.

SEC. 4. That nothing in this act contained shall be construed to relieve any officer or agent of the Government from prosecution under the penal statutes of the United States for any fraud, criminal conduct, illegality, or irregularity in connection with any of the agreements or orders referred to herein or the execution or signing thereof.

French Plant for Doble-Steamer

DETROIT, Jan. 20—The Doble-Detroit System Motors Co. has closed a deal whereby their car will be placed on the European market by the Society of Francais Doble, Paris, and the Detroit plant is about to ship its first complete machine to France. The French company is given the exclusive manufacturing and sales rights in France.

Henry Chevalier, formerly in charge of the Russian Renault Co., as director of technic, has retured to Paris after spending several months in Detroit, testing the car and studying manufacturing details. Paul Sicault, for a number of years identified with the Renault company in both France and Russia, is general manager of the Francais-Doble plant. A number of prominent French munition and automobile makers are interested in the foreign company and immediate production is being planned on a large scale.

Olympian Building Cars Again

PONTIAC, Jan. 21—The Olympian Motors Co., which for several months has engaged almost exclusively in war work, is getting back into passenger car production again. Although the Government contract calling for the manufacture of aerial drop bombs will keep the munition end of the plant running for some time, the company is busy re-organizing for resumption of its peace time business, and is now building three cars weekly.

The war contract will be completed by March 1. By that time the company expects to be turning out from ten to fifteen complete cars daily and have 400 men working in the motor car department.

The new Olympian car will be identical to that shown at the New York show last year with the exception of a few minor changes, the nature of which will be announced in a short time. No price reduction is contemplated, and the company is guaranteeing its dealers and distributers against a price drop. It sells for $1,240. The 1919 production schedule calls for the manufacture of 5000 cars. Frost-Norton Motors Co. of Pittsburgh, ordered 500 cars for immediate shipment.

Coal Production Increases 34,092,437 in Year

WASHINGTON, Jan. 21—Bituminous coal production for the week ended Jan. 11, 1919, totalled 10,287,000 tons as compared with 8,428,000 tons for the week ended Jan. 4, and 10,163,000 tons during the week of Jan. 11, 1918.

Anthracite coal production for the week totalled 1,651,000 tons, an increase of 262,000 tons over the production of the week of Jan. 4, but a decrease of 68,000 tons as compared with the corresponding week of 1918.

During the week ended Jan. 4, total losses of output of bituminous coal were 25.4 per cent, of which no market comprised 12.3 per cent, labor shortage 5.9 per cent, mine disability 3.6 per cent, car shortage 2.1 per cent and all other causes 1.5 per cent.

Bituminous coal production for the year 1918 amounted to 585,883,000 tons as compared with 557,790,563 tons for 1917, an increase in production of 34,092,437 tons for the year. Following is the bituminous coal production by months for 1917 and 1918:

—

Deeds Is Completely Exonerated

(*Continued from page* 227)

ings be instituted against Col. Deeds based upon those publications, because it is doubtful whether he ever saw the paragraph which has been adversely criticized and the statement contained in it was in accord with what Col. Deeds apparently believed and had reasonable cause to believe to be the facts."

In conclusion, the findings quote John D. Ryan, former head of aircraft production, to the effect that Col. Deeds performed a great service in expediting Liberty engine production and by not observing the strict regulations probably hastened quantity production by many months. Following is the letter correspondence from Secretary Baker to the Military Affairs Committeee:

Chairman Committee on Military Affairs,
House of Representatives:

Upon the submission to the President of the report of Honorable Charles E. Hughes and the report of the Attorney General covering the Aircraft investigation, I directed that the specific recommendations contained in these reports be extracted for my consideration and for such action by me as might be required in the premises. These extracts were referred to the Judge Advocate General of the Army, directing a thorough and comprehensive inquiry into the allegations affecting the conduct of Colonel Deeds. He was directed, not only to review all evidence taken by Judge Hughes, which the Attorney General kindly made available, but to secure all other facts obtainable in this case.

The Judge Advocate General committed the matter to a board of review consisting of officers of high ability and character wholly disassociated from any previous business or personal relations either with Colonel Deeds or with any matters affecting aircraft production. This board carefully and systematically examined all of this evidence and obtained all possible additional facts, and its conclusions are, therefore, based upon fuller inquiry than was found possible within the time and opportunities at the disposal of Judge Hughes, and this examination is in effect the accomplishment of the thorough inquiry which Judge Hughes had in mind when he suggested that these transactions be examined by a court martial. The purpose of Judge Hughes' suggestion is therefore accomplished.

This record undoubtedly shows that Colonel Deeds, absorbed in the activities of aircraft production, neglected to give his personal attention to transactions affecting his personal financial affairs, and this neglect on his part gave rise to appearances which required painstaking investigation in order to show their true character.

The unanimous report of this board of review, approved by the Acting Judge Advocate General, recommends that Colonel Deeds be not tried by court martial on any of the grounds suggested, and this recommendation has been approved by me.

Colonel Deeds was one of a large group of men who came to Washington at great personal and pecuniary sacrifice to render service to the Government, in the great emergency caused by our participation in the war.

My duty as Secretary of War with regard to any public servant under my jurisdiction is clearly to bring about proper punishment for wrongdoing and equally clearly to protect those public servants whose conduct is faithful and upright against embarrassment, humiliation or loss.

Very wide publicity has been attached to the acts of Colonel Deeds as a member of the Aircraft Board. Whether it will ever be possible to overtake the judgments which have been formed upon partial information on this subject I do not know; but this Department will make every effort to secure the widest publicity for the action now taken and for the grounds upon which it rests. To carry this into effect, I am therefore transmitting to your Committee for its information, and with the request for its publication in the Record, if the proprieties of the situation permit, a copy of the report of the Judge Advocate General. Similar copies are being furnished the Chairman, Committee on Military Affairs, United States Senate, the Attorney General and Colonel Deeds.

Inasmuch as the purpose of Judge Hughes' suggestion has been accomplished, I have directed that all the records in this case be filed in the War Department and that this matter be considered as closed. Cordially yours, Newton D. Baker, Secretary of War.

—

A Summary of the Movement of Crude Petroleum in November, 1918

WASHINGTON, Jan. 21—The comparative summary of the movement of crude petroleum, compiled from reports received by the U. S. Geological Survey, represents the operations of 220 pipe-line and refining companies handling or receivig oil directly from the productive fields east of the Rocky Mountains. Statistics of petroleum movement in California are not included for the reason that first-hand data were not available.

1918 Output of Petroleum Breaks Record

WASHINGTON, Jan. 21—The quantity of crude petroleum marketed from oil wells and field storage tanks in the United States in 1918 reached the record-breaking total of 345,500,000 bbl., as shown by preliminary estimates made by John D. Northrup of the United States Geological Survey. This output is an apparent gain of 3 per cent over the former high record, 335,315,601 bbl., established in 1917.

The output in 1918 includes no less than 6,500,000 bbl. of crude oil removed from field storage, but excludes drafts aggregating 20,500,000 additional bbl. from stocks of pipe-line companies. The surface reserve of crude oil held by oil producers and pipe-line companies in the United States at the end of 1918 is estimated at 123,000,000 bbl., compared with 150,000,000 bbl. at the end of 1917. These figures show that the demand for domestic petroleum in 1918 amounted to about 366,000,000 bbl. The exports of crude oil, most of it to Canada and to northwestern Mexico, aggregated about 5,500,000 bbl., leaving a total of 360,500,000 bbl. available to supply domestic needs. This quantity was insufficient, however, and about 36,500,000 bbl. was imported, nearly all from Mexico, to meet domestic requirements, which amounted in all to about 397,000,000 bbl.

The output is apportioned among the major fields as follows:

Field	1918	1917
Appalachian	25,300,000	24,932,205
Lima-Indiana	3,100,000	3,670,293
Illinois	13,300,000	15,775,860
Oklahoma-Kansas	139,600,000	155,043.596
Central & North Texas	15,600,000	10,900,646
North Louisiana	13,000,000	8,561,963
Gulf Coast	21,700,000	26,087,587
Rocky Mountain	12,660,000	9,199,310
California	101,300,000	93,877,549
Alaska & Michigan	....	10,300

Stroh Insures Employees

DETROIT, Jan. 20—The Stroh Casting Co. has purchased a group life insurance policy to cover the employees of its plant. Insurance will be issued each employee according to his length of service and automatically increases in amount as his term of service increases. Those employed from 3 to 6 months will benefit to the extent of $250, from 6 months to 1 year, $500; from 1 to 2 years, $1,000; from 2 to 3 years, $1,500; from 3 to 4 years, $2,000; from 4 years and over $2,500. In case of permanent disability, the company is prepared to pay the insured the amount of his policy.

Crude Petroleum Moved from Field Sources

Field	November, 1918.	October, 1918.	November, 1917.
Appalachian	2,160.909	2,398,947	2,132,583
Lima-Indiana	237,315	242,054	282,227
Illinois	1,019,300	1,145,193	1,246,105
Oklahoma-Kansas	11,334,048	11,763,898	13,822,893
Central and No. Texas	1,904,399	1,740,443	989,486
North Louisiana	1,321,715	1.483,168	290,487
Gulf Coast	1,591,685	1,866,393	1,502,122
Rocky Mountains	1,214,528	1,196,740	781,913

Apparent deliveries of crude petroleum.

Class of Oil.	November, 1918.	October, 1918.	November, 1917.
Appalachian	2,179,361	2,387,174	2,312,448
Lima-Indiana	390,943	176,805	259,368

Gulf Coast	7,905,067	7,970.056	9,277,697
Rocky Mountains	965,407	964,131	494,878

Plan a Limited Air Service

War Department Bill Provides Personnel for 2000 Planes—M. T. C. Small, Too

WASHINGTON, Jan. 20—Indications of the size of the future Air Service, Motor Transport Corps and Tank Corps Division of the Army are given in a proposed bill drawn up by the War Department this week. The bill, which will probably be held in abeyance pending possible developments in Europe, calls for an Air Service of 1923 officers and 21,853 enlisted men. The officers include one major general, one brigadier general, twenty-two colonels, forty-five lieutenant colonels, 126 majors, 438 captains, 696 first lieutenants and 594 second lieutenants. An organization of this size would require approximately 2000 airplanes in constant service.

The Motor Transport Corps, according to the proposed bill, will comprise one brigadier general, eight colonels, twenty-two lieutenant colonels, fifty-eight majors, sixty-one captains, 283 first lieutenants, 649 second lieutenants and 20,737 enlisted men. This organization will constantly require 10,000 motor trucks and other vehicles for its equipment. The Tank Corps will comprise 377 officers and 5855 enlisted men.

—

Direct Phone Connection with Airplane

WASHINGTON, Jan. 20—Communication between an airplane in the air and a regular telephone on the Washington city line was established yesterday at the office of Major-General William L. Kenly, Director of Military Aeronautics. Although regular radio telephonic conversation frequently has been held with planes in the air at flying fields, this is the first demonstration of the combination of the radio-phone and regular land telephone.

General Kenly, Colonel F. R. Kenney and Colonel C. C. Culver were present in the office of the Director of Military Aeronautics and talked with Lieutenant Lucas, who was piloting a plane from Bolling Field. The two links in the line were the radio-telephone from the plane to the small station at Bolling Field, and the city telephone system from Bolling Field to General Kenly's office. The conversion of radio to direct wire was made automatically at the Bolling Field station with apparatus devised by members of the Air Service Radio Branch under the direction of Colonel Culver.

—

New Aviation Insignia

WASHINGTON, Jan. 17—An insignia for fliers has been approved with certain changes as follows: (a) Military aviators, junior military aviators and reserve military aviators: a device of oxidized silver consisting of a pair of wings with the shield between; to measure 3 in. from tip to tip.

(b) Military aeronaut, junior military aeronaut and reserve military aeronaut: a device of oxidized silver consisting of a pair of wings with a balloon between; to measure 3⅛ in. from tip to tip.

(c) Observer: an oxidized silver single wing to the left of the letter "O" in bright silver; the "O" to encircle the letters "US" in oxidized silver in relief on an oxidized silver background; the device to measure 1⅞ in. in length.

Flying instructors: gilt insignia of the same design and size as the insignia for officers of the Air Service, omitting the propeller; to be worn just above the right cuff on all coats.

—

Navy Dirigible in Air 40 Hours

WASHINGTON, Jan. 20—Two remarkable endurance flights by the Navy Dirigible A-236 from the naval air station at Key West, one lasting 32 hours and covering 750 miles, and the other 40 hours and 48 minutes, and covering about 850 miles, constituting a service record, were described in official reports made public last night.

Rising winds and threatening storm stopped the first flight Nov. 24, although sufficient fuel and oil remained for 8 more hours. During the first 10 hours the ship was lightened 300 lb. by consumption of gasoline. Her crew brought her down to within 50 ft. of the sea and with buckets and line took up enough water to restore her propeller balance.

The second trip, made Dec. 24-25, was made under overcast skies with a wind ranging from 20 to 36 miles an hour. The propelling motor was stopped only twice, for 3 minutes each time, to fill the oil reservoir.

—

U. S. Naval Aircraft Production

WASHINGTON, Jan. 20—The U. S. Naval Aircraft factory at Philadelphia produced aircraft valued at $5,435,000 up to the time the armistice was signed, according to an announcement made here to-day. It had completed, ready for shipment, 183 twin-engine flying boats at an average cost of $25,000. It had also produced 4 experimental Liberty engine seaplanes carrying the Davis non-recoil gun, at a cost of $40,000 each, and 50 sets of twin-engine flying boat spare parts worth $10,000 per set. In addition, considerable minor experimental work and overhauling of machines from other stations was done.

No Show for Montreal

MONTREAL, Jan. 21—At the special general meeting of the Montreal Automobile Trade Association, Ltd., it was decided that no show will be held under the auspices of the association during 1919.

Much Confusion About Labor

Conflicting Reports Regarding Shortages and Unemployment Unreconcilable

WASHINGTON, Jan. 20 — Considerable confusion and doubt as to accurate labor conditions throughout the country exist here as a result of conflicting statements made by various officials. On one hand during the past week there have been reports from the Department of Labor and officials of the American Federation of Labor indicating increasing labor surpluses and threatening possible labor troubles as a result. On the other hand, there are denials of these conditions made by Congressmen following receipt of information directly from the various cities supposed to be suffering from labor surplus.

It is stated on one hand that the reports of surplus of labor are to some extent calculated to produce a slackening of army demobilization and consequently continue labor shortage as much as possible, with a consequent maintenance of the war wage standard. Labor authorities, however, maintain that the surplus reported is correct, and that if demobilization continues at the present rapid rate serious unemployment conditions will result.

Reports received during the past week by the Department of Labor indicate a demand for agricultural labor in Arizona, South Carolina, Texas, a slight demand in the building trades in Arkansas, Maine, Oklahoma and Virginia. There is a surplus of labor throughout California, Colorado, Connecticut, Illinois, Indiana, Iowa, Kentucky excepting Louisville, Massachusetts, Michigan, Missouri, New Mexico, New York, Oregon and Utah.

Normal conditions exist in Kansas, while the demand exceeds the supply in Maryland, Minnesota, New Jersey, Pennsylvania, Virginia, Washington and Wyoming. A large surplus of unemployed is reported from Detroit. Rubber workers are in demand in Ohio, and unsettled labor conditions are reported from Toledo. The United States Employment Service reports registering 147,774 applicants for jobs, of whom 103,868 were placed in positions. During the same period 247,619 calls for labor were received. Of the registrants 15,882 were women.

As evidence of the confliction of reports, Pennsylvania shows 18,808 registrations for positions wanted during the week and 57,428 calls for help wanted in the same period.

Twelve states reported a surplus of common labor, according to the department's statement, which adds that Detriot has a surplus of 20,000, Cleveland 20,000, Buffalo 12,000 and Toledo 10,000 workers, while Baltimore has a shortage of 4800, Philadelphia 6000 and Pittsburgh 4000 workers.

Present Organization of Department of Military Aeronautics

DIRECTOR of MILITARY AERONAUTICS

Directs the Department of Military Aeronautics through the Assistant Director and Executive Officer.

MAJ. GEN. W. L. KENLY.

ASSISTANT DIRECTOR

Duties correspond to those of chief of staff; responsible for efficient administration of the Dept. of Mil. Aeronautics.

COL. H. H. ARNOLD.

CONTROL BOARD

Determines policies, makes organization plans, acts as clearing house for all matters outside jurisdiction of any one section. Has supervision over promotions and changes in organization and methods.

Pres.	Lt. Col. W.E. Gillmore.
Member	Lt. Col. J. R. White.
"	Maj. R. P. Cousins.
"	Maj. B. F. Castle.

ORGANIZATION SURVEY

Devotes entire time to questions of organization including, Functions, Facilities, Equipment, Personnel, Methods and Records, to bring about more unified and co-ordinated organization.

In Charge	Mr. R. A. Pettengill.

FOREIGN MISSIONS

Places at the disposal of the Dept. of Mil. Aero. the experiences gained by the Allies in the European War to date.

British	Brig. Gen. C.F. Lee.
French	Lt. Col. J. Tulasne.
Italian	Maj. L. Falchi.

AERO INFORMATION

Procures Indexes, Catalogues, Edits. Files and distributes all information pertaining to the subject of Aeronatuics.

Chief	Maj. J. A. Drexel

EXECUTIVE SECTION

Administration of headquarters; promulgates policies and decisions of Control Board; Co-ordinates work of administrative sections; issues circulars & memo orders, charge of passes & leaves of Hdq'rs, personnel. Ex. Officer & Assts. are the only officers authorized to communicate orally with Gen. Staff, except as specified by Director or Ass't. Director of Mil. Aero.

Executive Officer	Lt. Col. F R. Kenney.
Personnel	Lt. Col. G.H. Shields.
Adm' & Training	Maj. O.H. White.
Radio	Lt. Col. C.C. Culver.
Gunnery	Maj. A.H. Hobley.
Operation & Tech.	Maj. L.H. Drennan.
Supply & Fin'ce	Capt. S.V. Schermerhorn.
Handley-Page Proj.	Capt. F. Briscoe.
Correspond's	Capt. J.B. Reynolds.
Cables	Lt. D.G. Keeble.
Office Mge'm't	Mr. H.W. Cuddy.

TECHNICAL SECTION

Passes on such design of aircraft and its accessories as are submitted to it by the Bureau of Aircraft Production.

Chief	Lt. Col. T.H. Bane.
Exec't Officer	Maj. Geo. Stevens.
Design	Lt. Col. V.C. Clark.
Airplanes	Maj. H.S. Martin.
Armament	Lt. C. Frick.
Instruments	Lt. W.W. King.
Engines	Lt. Theo. Mayns.
Radiators	2nd Lt. G.S. Jacobs.

MEDICAL SECTION

Handles all matters affecting the Medical Department, which relate to development, maintenance, organization and operation of aeronautical personnel their equipment supplies, etc.

Chief	Brig. Gen. T.C. Lyster.
Exec't Officer	Col. G. H. Grabtree.
Property & Sup.	Lt. Col. N. Gapen.
Reports & Stats	
Hospitals	Lt. Col. S. M. De Loffre.
Research Board	Lt. Col. E. G. Seibert.
Care of Flier	Lt. Col. I. H. Jones.
Care of Flier	Maj. E.J. Martal. Chief Physical Director.

ADMINISTRATIVE SECTIONS

PERSONNEL SECTION

Responsible for procurement of all records concerning personnel for Dept. Mil. Aero. including officers enlisted men and civilians. also examines and selects candidates for commissions and secures commissions. Handles routine correspondence relating strictly to matters of personnel.

Chief	Lt. Col. Arthur Woods.
Exec't Officer	Maj. R.B. Lincoln.
Procurement	Maj. E.H. Litchfield.
Commissions	Capt. J.A. Ripley.
Officers	Capt. A.C. York.
Enlisted Men	Capt. J. Milledge.
Civilian	Capt. J.E. Enright.

TRAINING SECTION

Responsible for all training in the Department of Military Aeronautics including both commissioned and enlisted personnel. Administraters affairs of Mil. Aero. Flying Gunnery, Balloon, Enlisted Mechanics, Photo. and Radio Schools.

Chief	Col. M.F. Davis.
Ass't for Heavier-than Air	Maj. M.F. Harman, Jr.
Ass't for Lighter-Than Air	Lt. Col. A.L. Fuller.
Exec't Officer	Maj. J.R. Moultbrap.
Ground Sch'l	Capt. Geo. A. Washington.
Flying	Maj. W.P. Jernigan.
Photographic	Maj. J.S. Sullivan.
Mech. Instr'c't	Maj. A.J. Hanlon.
Gunnery	Capt. R.S. Potter.
Radio	Lt. Col. T.L. Crystal.
Balloon	Lt. Col. A.L. Fuller.

OPERATIONS SECTION

Operates all commissioned and enlisted personnel after completion of training, including all activities in the Dept. of Military Aero, in which the personnel is not undergoing school training and control of the activity or unit is not specifically assigned to another section. Responsible for organization of all aviation units, both home and insular, and for home defense. Administers aviation concentration camps and has jurisdiction over Dept. Mil. Aero. Officers on all matters relating to organization, operation and movements of organized aviation units.

Chief	Lt. Col. G.G. Brant.
Exec't Officer Home Defense	Maj. Wm. J. Fitzmaurice.
Exec't Officer Organization	Maj. Leigh Sypher
Organization	Lt. C. Du Bosque.
Post Adm tion	Capt. J.C. Tureck.

SUPPLY SECTION

Performs usual functions such as purchase, Storage and transportation of equipment, also transportation of personnel, and all movements of organized aviation units as directed by the Chief of Operations.

Chief	Col. C.G. Edgar.
Ass't Chief	Lt. Col. E.L. Jones.
Exec't Officer	Capt. C.G. Brown.
Asst. to Ex. Officer	Lt. D.M. Osborne.
Engineering	Maj. T.G. Gallagher.
Material	Maj. F.L. Martin.
Motor Transportation	
Eng & Plane Main't	Capt. H.R. Eyrich.
Repair Depots	Capt. D.L. Deacon.
Oil & Lubrication	Mr. W.H. Parish.
Bldg. & Grounds	Capt. Edw. Burns.
Conservation	

Directs and supervises construction and maintenance of all structures and utilities through Officers on Staffs of commanding Officers. Also administers supply and Repair Depots, Audits all Dept. of Military Aeronautics accounts and is responsible for all disbursements. Maintains Consolidated aviation property accounts and supervises examination returns from Property Officers.

Finance	Maj. H. Bennington.
Asst. for Finance	Capt. C.M. Neubauer.
Accounting	Mr. S.B. Button.
Disbursing	Capt. R.C. Baldwin.
Propt'y. Acc'tibility	Capt. T.A. Grant.
Ass't Aud't	Lt. G.A. Pfau.
Traffic & Stor.	Maj. C.S. Benton.
Traffic	2nd Lt. D.R. Darner.
Storage	Capt. L. Dominick.
Embarkation	Lt. Wm. Penick.
A.P.C. #2.

Men of the Industry

Changes in Personnel and Position

Capt. Harold J. Vogler was appointed district sales manager for the Service Motor Truck Co., assigned to District No. 2, which includes Maryland, Virginia, District of Columbia and the Carolinas, and took up his new work on Jan. 1. Previous to entering the army, Captain Vogler was wholesale manager for the Willys-Overland Co. and also had charge of its dealer organization in the East. Prior to his connection with Willys-Overland he was Eastern superintendent for the Maxwell Co.

P. J. W. Kelley has joined the sales force of Gray & Davis, Inc., as sales engineer.

Roy T. Middleton, who in May, 1917, resigned as Detroit manager for the Steel Products Co. to enter the air service in France, reached Detroit last week as Capt. Roy T. Middleton and is on his way to Cleveland to become general representative for the Standard Steel Casting Co.

Glenn L. Orr, who has been connected with the Briscoe Motor Corp., Jackson, as purchasing agent, has resigned to become secretary of the M. H. Herrmann interests, Detroit.

M. L. Hemingway has been appointed assistant manager of the Motor and Accessory Manufacturers' Association. He assumed his new duties Jan. 18. For the past year he has been secretary of the War Service Committee of the Rubber Association of America.

L. P. Prossen has resigned as mechanical superintendent of the Black & White Taxicab Co., New York, and has become associated with the Nilson-Miller Co., Hoboken, where he has been elected vice-president, and will be in charge of the gear cutting, piston and piston ring departments.

E. R. Greer, at one time engineer of the Emerson-Brantingham Implement Co.'s tractor plant at Minneapolis, has been placed at the head of the service department of the Four Wheel Drive Auto Co.

C. H. Smith has recently joined the A. B. C. Casting Co., Cleveland, to take charge of its aluminum forging development work. He was formerly with the Driggs-Seabury Ordnance Corp. and later with the Ladish Drop Forge Co., Cudahy.

Sutherland G. Taylor, Jr., who has been appointed export manager for the Holt Mfg. Co., assumed his duties at the Peoria plant Jan. 1. For several years Mr. Taylor was vice-president and New York manager of Cyrus Robinson & Co., engineers and exporters of New York and London. He has recently received his discharge from the army, where as lieutenant in the Ordnance Department he was assistant to the chief of the Motor Equipment Section.

Larger Duties for Lt. Col. Jones

WASHINGTON, Jan. 17—Lt. Col. R. M. Jones, A. S., A. P., was appointed Assistant and Executive Officer to the Acting Director of Aircraft Production on Dec. 28. In addition to his present duties as Executive Officer, he will also be charged with such activities as pertain to liaison, correspondence with the War Department and other departments or bureaus of the government.

Lt. Col. H. C. Clark, A. S., A. P., in addition to his other duties, will take over the duties of adviser and assistant to the Acting Director on matters pertaining to personnel for the bureau.

Lt. Col. O. Westover, A. S., A. P., is appointed assistant to the Acting Director of Aircraft Production.

Major George F. Lyons, A. S., A. P., is hereby appointed assistant to the Acting Director of Aircraft Production.

Two New Vice-Presidents for the Republic Rubber

YOUNGSTOWN, Jan. 10—Harvey J. Woodard and Mark W. Roe have been advanced to the position of vice-president of the Republic Rubber Corp. Mr. Woodard becomes vice-president in charge of sales and Mr. Roe vice-president in charge of the plant. Mr. Roe joined the Republic as consulting engineer.

Lt. Ezra W. Clark, having received his discharge from the Air Service, has become advertising manager for the Clark Equipment Co., Buchanan, Mich. Mr. Clark was for many years editor of the Chicago Inter-Ocean, and later business manager of the Mobile Item and advertising manager of the Memphis News Scimitar.

Fred M. Elvidge, Jr., has received his discharge from the army and has resumed his desk at the New York office of the Ajax Rubber Co., where he is the branch store supervisor. He left Ajax in February to join his regiment and then went through the Officers' Training School at Camp Gordon, emerging with a commission of second lieutenant. The resumption of his duties will once more place him in charge of the branch stores throughout the country.

Eugene W. Lewis, former vice-president of the Timken-Detroit Axle Co., which position he relinquished to become chief of the production branch of the general staff of the army in Washington, has completed his work, and will take a long rest before resuming his business activities.

W. E. Biggers, who has been appointed assistant to the president of the Owosso Mfg. Co., maker of screen doors and window screens, at Owosso, Mich., will take up his new duties on Feb. 1. For four years Mr. Biggers was advertising manager of the Hyatt Roller Bearing Co., and is now advertising manager of the Motor Equipment Division, United Motors Section, General Motors Corp., which includes the advertising managership of the Hyatt Roller Bearing Co., the Klaxon Co., the Jaxon Steel Products Co. and the Harrison Radiator Corp.

Walter A. Almy has been promoted from the position of manager of the passenger transportation department to that of general distribution manager of the Packard Motor Car Co., Philadelpia.

Captain G. F. Aitken of the U. S. Army Ordnance Department has returned to the sales organization of the Detroit Cadillac Motor Car Co., New York.

W. J. Johnson, who for some years has looked after the interests of the Connecticut Telephone & Electric Co. with automobile manufacturers, has been promoted to the position of field sales manager.

Norman S. Hobson, on his release from military service, has associated himself with the Connecticut Telephone & Electric Co. and will handle the sales in New England and upper New York State.

Victor W. Peterson, formerly advertising manager of the Stewart-Warner Speedometer Corp., has now become associated with the Wm. R. Johnson Mfg. Co., 359-361 E. Ohio Street, Chicago, in the capacity of general manager.

F. W. Sutton, formerly production manager of the Continental Motors Corp., and later general superintendent of the Dayton-Wright Airplane Co., is now the chief engineer of the Charles E. Dedeaux Co., industrial engineers, with headquarters in Cleveland.

R. Y. Cooke has been made secretary and general sales manager of the Racine Rubber Co., Racine, and director of the Ajax Rubber Co., New York. He succeeds Mr. Severance, who died recently.

Gilbert U. Radoye has become associated with the Haynes Automobile Co., Kokomo, as advertising manager and assistant sales manager. He was formerly affiliated with the advertising division of the Hudson Motor Car Co., the Packard Motor Car Co. and with the Nordyke & Marmon Co.

Charles M. Jessup, who for the past 4 years has been directing the motor equipment of the Remy Electric Co., Detroit, has been appointed assistant to O. F. Conklin, president of the company. In addition to his new duties as assistant to the president, he will have charge of the sales of the motor equipment division, and will be located at the Detroit office.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

U. S. Light & Heat Corp. Devoted 75 Per Cent Activities to Government

NIAGARA FALLS, Jan. 20—The U. S. Light & Heat Corp. had 75 per cent of its plant capacity devoted to war work, this percentage including 900 employees. The production of their output was apportioned as follows: Batteries, 10 per cent; parts for tanks, 60 per cent; parts for gas shells, 8 per cent; parts for army trucks, 1 per cent; parts for airplanes, 1 per cent, and products for the U. S. Railroad Administration, 5 per cent, making a total of 85 per cent. To carry out this program, fifteen of a group of nineteen buildings were devoted to war work, and it was necessary to make two additions to its plant representing 27,960 sq. ft., besides a new building of 17,000 sq. ft. It has been making only 50 per cent of its normal peace time product.

Delaney Oil Now Lindsay-McMillan Co.

MILWAUKEE, Jan. 20—The Delaney Oil Co., 45-47 Third Street, a large wholesaler and jobber of petroleum products, greases, etc., has changed its name to Lindsay-McMillan Co. The principal owners are Lieut. Walter S. Lindsay and William A. McMillan. The works and storage houses are located at 83 South Water Street.

Manufacturers Hardware Corp. Formed

MILWAUKEE, Jan. 20—The Manufacturers Hardware Corp. has been incorporated with a capital stock of $100,000 to manufacture and sell machinery, accessories, supplies, etc. Lyle E. Beeman, head of the Universal Mfg. Co., 491 Broadway, manufacturer of farm lighting systems and other direct-connected generating units, is one of the incorporators.

Prest-O-Lite to Rebuild Milwaukee Plant

MILWAUKEE, Jan. 20—The Prest-O-Lite Co., Indianapolis and New York, has awarded contracts for the erection of a new acetylene gas making and compressing plant here to replace the unit which was destroyed by explosion and fire on Nov. 22. The building will be 60 x 120, of fireproof construction.

Gas Tank Plant to Be Rebuilt

MILWAUKEE, Jan. 18—The entire plant of the Gas Tank Recharging Co., 1245 Twenty-third Avenue, was destroyed by explosions and resulting fires on Monday night, Jan. 13, causing an estimated loss of $50,000. The company will rebuild at once. The plant is used for manufacturing and compressing acetylene gas for the oxy-acetylene welding industry and for other industrial purposes. The main plant of the company is at Keokuk, Iowa, where $500,000 was invested during 1918 in the erection and equipment of one of the largest carbide works in America.

Vocational School for Willys-Overland

TOLEDO, Jan. 20—The Willys-Overland is to establish a vocational training school for its employees at its plant here. Training will be given in machineshop work. The school will occupy a separate department in one of the factories.

New Officers for Turnbull Motors

DEFIANCE, OHIO, Jan. 21—A. F. Mitchell, vice-president of the Northern National Bank of Toledo, was elected president of the Turnbull Motor Truck & Wagon Co. at the company's annual meeting. He succeeded W. O. Allen, general manager of the Allen Motor Car Co., Fostoria, who continues as a member of the board of directors. Other officers elected were: Vice-president, R. G. Holgate, vice-president of the Merchants' National Bank; treasurer and general manager, Charles C. German; secretary, L. J. Spafford; general sales manager, W. L. Krapp; advertising manager, George A. Wieland; chief engineer, H. K. Rienoehl; directors, the officers and T. T. Shaw, C. H. Kettenring, vice-president and general manager of the Defiance Machine Co.; J. G. Schrag, secretary and treasurer of the Screw Machine Products Co.; R. C. May, general sales manager of the Defiance Machine Co.; F. J. Papenhagen, secretary and manager of the Defiance Printing & Engraving Co., and W. O. Allen.

Kramer Increases Capital

GRAND RAPIDS, Jan. 20—F. W. Kramer Motor Co. has increased its capital stock from $20,000 to $40,000.

Dividend Declared

Sterling Tire Corp., Rutherford, N. J., 4 per cent quarterly, common; 7 per cent annual, preferred; paid Jan. 15.

Service Motors Declares Dividends

WABASH, Jan. 20—The Service Motor Truck Co. declared a 6 per cent dividend, payable to stockholders of record Dec. 31, 1918, making a total of 15 per cent for the year just closed.

Ford's Manchester, England, Production

In an article in AUTOMOTIVE INDUSTRIES last week it was stated that the Ford Company is producing 3000 cars daily in its Manchester, England, plant. This should have read a total of 3000 cars, parts for which are being imported by special government arrangement.

Nathan Novelty Mfg. Co. in New Factory

NEW YORK, Jan. 21—The Nathan Novelty Mfg. Co. will move to its new factory at the corner of Twelfth Street and Fifth Avenue on or about Feb. 1.

Reo Back to Peace Time Production

LANSING, Jan. 17—Less than 100 government vehicles are incomplete on the contract held by the Reo Motor Car Co. All government parts, equipment and fixtures are being moved from the main plant to the truck plant this week. Moving work will be completed in a few days and the company will by that time have swung back to its own production in its main plant. The last motor for tractors went through the plant several days ago. Assembling of the tractors is all that remains before completing the contract. That no time may be lost in production, the company will this year take a running inventory.

Maibohn Motors to Have Michigan Plant

RACINE, Jan. 16—The Maibohn Motors Co., it is understood, is seeking a location in Michigan. Reports from several cities are that the mayors and Board of Trade heads have received letters asking for privileges in event of locating there. This company's plant was destroyed by fire recently. It was announced that the plant here would be rebuilt.

Long Island City Plant for Phianna

NEW YORK, Jan. 20—The Phianna Motor Co. has leased a factory in Long Island City and has started production on a revised model of the car which it has had on the market during the past year. This will have a four-cylinder 3 29/32 x 6 engine, 125-in. wheelbase and 32 x 4½ tires. The chassis is essentially the same as the previous model and sells for the same price. Bodies are to be custom built, the standard brougham model selling for $6,000. A slight change has been made in the external appearance of the car through the use of a square radiator.

Templar Enlarges Plant.

CLEVELAND, Jan. 20—The Templar Motors Corp. has had erected a three-story, 500 x 72 ft. addition to its plant. It is a concrete structure with the outside walls practically all glass. This increased floor space of almost 2½ acres is now being equipped with machinery.

More Capital for Gardner Machine

BELOIT, WIS., Jan. 20—The Gardner Machine Co. has increased its capital stock from $500,000 to $750,000 to cover the extension of its facilities and growth of its business.

New Plants for General Motors

DETROIT, Jan. 20—Rumors are current here that the General Motors Corp. is planning the construction of a new differential gear plant here. The company is also said to have its eye on the Canadian market, and that a big assembly plant may be built soon in some Dominion city.

Contracts Placed

WASHINGTON, Jan. 16—Following are contracts placed by the Motors and Vehicles Division of the Quartermaster Department, under date of Jan. 6, 1919:

Walker Mfg. Co., Racine, 1200 Badger 5-ton truck jacks, $7560.
Fisk Rubber Co., Washington, 250 casings, $9100.
Fisk Rubber Co., Washington, 5725 casings, $20,925.
Winton Motor Car Co., Cleveland, motor parts, $10,113.54.
United States Tire Co., New York, 385 casings and tubes, $11,804.25.
Standard Woven Fabric Co., Walpole, motor parts, $6750.
Silvex Co., South Bethlehem, motor parts, $11,284.
Goodyear Tire & Rubber Co., Akron, 700 casings, $25,480.

WASHINGTON, Jan. 16—Following is a list of contracts placed by the Motors and Vehicles Division of the Quartermaster Department:

Jan. 2, 1919.

Kelly-Springfield Tire Co., Akron, 300 casings, $10,920.
Miller Rubber Co., Akron, 3000 casings, $31,250.
Locomobile Co. of America, Bridgeport, 180 radiators, $28,800.
Dodge Bros., Detroit, 30 sets spare parts, $424,450.

Jan. 4, 1919.

Eisemann Magneto Co., Brooklyn, motor parts, $16,456.35.
Federal Rubber Co., Washington, 700 bicycle tires and casings, $5495.
Eisemann Magneto Co., Brooklyn, motor parts, $5,009.50.
Federal Rubber Co., Cudahy, 3500 bicycle tires, $13,720.
Firestone Tire & Rubber Co., Washington, 250 tires, $7582.
Marvel Carburetor Co., Flint, motor parts, $24,026.40.
Packard Motor Car Co., Detroit, motor parts, $14,491.60.
Peerless Motor Car Co., Cleveland, motor parts, $19,923.21.
United States Rubber Co., New York, 900 casings, $16,345.
The Goodyear Tire & Rubber Co., Akron, 8640 tires, $344,736.
The Goodyear Tire & Rubber Co., Akron, 1684 tires, $53,994.38.
The Goodyear Tire & Rubber Co., Akron, tubes and casings, $26,358.85.
Splitdorf Electrical Co., Newark, motor parts, $14,500.
Silvex Co., South Bethlehem, 22,500 spark plugs, 15,000 petticoat spark plugs, insulator type plugs, $8463.

Motor Imports to New Zealand Fall Off

WASHINGTON, Jan. 22—The motor car, motorcycle, and tricycle trade in New Zealand has fallen off materially during the last 2 years, and will doubtless continue at a lower rate as long as the exceptionally high price of benzine, gasoline, etc., continues, according to a consular report.

However, motor cars are being put to more practical use in the country than ever before, since farmers are using them extensively for different kinds of work about the farm and in transport wherever it is possible, using such attachments and improvements as are now on the market to adapt them to different kinds of work.

The high-water mark was reached in 1916, when the number of cycles imported was 2,287 and the number of motor cars 6,174. The following table gives the imports for the years 1914 and 1917:

Motor Bicycles and Tricycles

Imports from	1914 No.	1914 Value	1917 No.	1917 Value
United Kingdom	2,296	$191,292	896	$87,120
United States	189	27,310	970	202,595
All other	15	2,307	....	....
Total	2,500	$220,909	1,366	$289,715

Automobiles, Trucks, Etc.

Imports from	1914 No.	1914 Value	1917 No.	1917 Value
United Kingdom	1,093	$1,535,940	72	90,141
Canada	873	482,639	1,010	411,574
France	134	163,513	1	1,722
United States	1,308	1,338,997	3,596	2,597,246
All other	58	103,744	1	730
Total	3,466	$3,624,833	4,680	$3,101,413

It will be noted that in 1914 motorcycles and tricycles were nearly all imported from the United Kingdom, while in 1917 a large majority of them came from the United States. This is largely true in regard to motor cars, but not to the same extent, for in 1914 there were 1,093 motor cars imported from United Kingdom, as compared with 72 motor cars in 1917, while from the United States there were 1,308 imported in 1914, as compared with 3,596 in 1917.

These favorable conditions enjoyed by American cars and motorcycles cannot be expected to continue after the closing of the war, and American manufacturers and exporters will need to look carefully after the trade in this part of the world.

Farm Tractors in Tunisia

WASHINGTON, Jan. 22—The Direction de l'Agriculture, du Commerce et de la Colonisation of Tunis is at present making plans for the purchase, on behalf of Tunisian farmers, of a certain number of recent type caterpillar tractors, 45 hp., with their complete plowing outfits, according to a report by the vice-consul.

These caterpillars were bought in the United States some time ago by the French Government for military purposes, but have not been used. They are now placed on sale by the French Government. If the prices can be agreed upon a first lot of 20 tractors is expected to be bought, and other purchases to follow.

An important consideration is that these machines are all of the same type and their upkeep will thereby be simplified, the same interchangeable repair part fitting any of them.

It is not so much the capital involved in the purchase of the tractors that makes the Tunisian farmers hesitate to buy American tractors, but the expenses and difficulties connected with their upkeep and in procuring repair parts.

A number of 75-hp. used caterpillar tractors are also stated to be offered for sale by the French military authorities, and their purchase is being considered.

Boston May Have Truck Show

BOSTON, Jan. 20—Chester I. Campbell has finished his government labors and is again directing the work of the Boston automobile show. The question of a truck show will be decided next week, when a conference is held on the subject.

Foreign Trade Opportunities

WASHINGTON, Jan. 22—Foreign trade opportunities have been received by the Bureau of Foreign and Domestic Commerce as follows. Additional information can be secured from the Bureau by mentioning the opportunity number in each instance:

A man in Italy desires an agency for automobiles, motorcycles and side cars. Foreign Opportunity No. 27967.

A man in France desires an agency for automobiles and trucks. No. 27978.

An agency is desired by a firm in Italy for trucks to be used for passenger service with a carrying capacity of 1½ tons, 30 to 40 hp., and 4 tons, 50 to 70 hp., and also solid rubber tires. No. 28054.

An agency in France for automobile accessories and farm tractors is desired. No. 28051.

A firm in Italy desires an agency for passenger cars and motorcycles. No. 28060.

A man in India desires a farm tractor agency. No. 28066.

An automobile accessory agency is desired by a Frenchman who is now in this country and who desires an agency for Belgium and northern France. No. 28080.

An Italian firm desires an agency for automobile accessories. No. 28081.

A Frenchman desires an agency for motor cars, farm tractors and accessories. No. 28075.

A citizen of Costa Rica, who is at present in the United States, desires an agency for the sale of automobiles and accessories. No. 27958.

An agency is desired by a man in France for the sale of motor cars and accessories through Roumania and the Balkan States. No. 27959.

A firm in France desires to purchase several thousand bicycles and motorcycles and accessories. No. 27988.

A man in Italy desires to secure an agency for the sale of agricultural implements and machinery. No. 28016.

A merchant in Algeria desires to secure an agency for the sale of open and closed automobiles and trucks. No. 28017.

Growth of Italian Automobile Industry

WASHINGTON, Jan. 20—The Italian automobile industry is of great importance, and during the war has given proof of extraordinary development, extending its sphere of action also to the fields of aviation, says the Board of Trade Journal in quoting *Il Tempo*, of Rome. The number of companies engaged in this industry has increased from 32 on Dec. 31, 1913, to 55 at the end of 1917, while the capital employed has risen from $9,489,231 to $31,212,160 as shown below:

Departments	Companies	1917
Piedmont	18	$18,767,840
Liguria	5	1,133,600
Lombardy	25	8,482,080
Venetia	1	80,000
Emilia	1	4,800
Tuscany	2	124,800
Umbria	2	64,640
Lario	2	468,800
Campania	4	2,085,600
Total	55	$31,212,160

The average dividend has increased from 3½ per cent in 1913 to 8 per cent in 1917.

As regards foreign trade, the import of automobiles has declined from a value of $2,611,554.80 in 1913 to $1,236,784 in 1917 (up to Dec. 13), a falling off of $1,374,770.80. Exports, however, have increased from $5,468,949.92 to $18,511,008.80.

No Visé for Mexican Export Licenses

WASHINGTON, Jan. 18—Applications for export licenses to Mexico will no longer require the visé of an American consul.

Calendar

ENGINEERING

S. A. E. Meetings

Jan. 30—Chicago—"Home-coming" Supper, Morrison Hotel.

Feb. 3—New York—Banquet in honor of Capt. E. V. Rickenbacker, Waldorf-Astoria, Contest Board, American Automobile Association.

Feb. 4-6—New York. Winter Meeting. Society of Automotive Engineers, Engineering Societies' Building.

Feb. 6—Victory Dinner, Hotel Astor, New York.

Feb. 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Radiator Cooling Fans."

March 5 — Minneapolis Section, S. A. E.—Hotel Radisson. "Tractor Service and Sales."

April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

MOTOR SHOWS

Jan. 20-25 — Shreveport, La. Shreveport Automobile Dealers' Assn. Henry B. Marks, Manager.

Jan. 20-25 — Hartford, Conn. Broad Street Armory, Auspices of Agricultural Interests.

Jan. 24-30 — Milwaukee, Wis. Eleventh Annual, Milwaukee Automobile Dealers, Inc., Auditorium. Bart J. Ruddle, Manager.

Jan. 25-Feb. 1—Chicago. Passenger cars, Coliseum.

Feb. 1-15—New York. Automobile Dealers' Assn. Charles A. Stewart. Manager. Hotel Woodward, Broadway and 55th St.

Feb. 3-6 — Chicago. Trucks, Coliseum.

Feb. 4-7—Fargo, N. D. Fargo and Moorhead Automotive Trade Assn.

Feb. 6-15—San Francisco, Cal. Third Annual Pacific Automobile Show, Motor Car Dealers' Assn. of San Francisco. Exposition Auditorium. G. A. Wahlgreen, Manager.

Feb. 10-15—Rochester, N. Y. Rochester Automobile Trades Assn., Exposition Park. George C. Donahue, Manager.

Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.

Feb. 15-22 — Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.

Feb. 15-22—Albany, N. Y. Albany Automobile Dealers' Assn. State Armory.

Feb. 17-22—St. Louis. St. Louis Auto Mnfrs. & Dealers' Assn. Robert E. Lee, Manager.

Feb. 17 - 22 — Louisville, Ky. Louisville Auto Dealers' Assn.

Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.

Feb. 17-22 — Pittsfield, Mass. Pittsfield Automobile Dealers' Assn., State Armory. James J. Callahan, Manager.

Feb. 17-22 — Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.

Feb. 17-22—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

Feb. 18-22—Baltimore, Md. Baltimore Automobile Dealers' Assn. and Automobile Club of Maryland, Fifth Regiment Armory. H. M. Lucius, General Manager.

Feb. 18-22 — Oklahoma City, Okla. Automotive Show. R. H. Haun, Manager.

Feb. 22-Mar. 1—Hartford, Conn. Hartford Automobile Dealers' Assn., Inc., Broad Street Armory. Ben F. Smith, Manager.

Feb. 22-Mar. 1—Atlantic City, N. J. Auto Trades Assn. of Atlantic City.

Feb. 23-March 1—Cedar Rapids. Auditorium, Automobile Dealers' Assn.

Feb. 24-Mar. 1—Burlington, Ia. Second Annual.

Feb. 24-March 1—Kansas City, Mo.—Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

Feb. 24-Mar. 1 — Springfield, Mass. Automobile Dealers' Assn. Harry W. Stacy, Manager.

Feb. 24-Mar. 1—Portland, Ore. Ninth Annual, Dealers' Motor Car Assn., Auditorium. M. O. Wilkins, Manager.

Feb. 26-Mar. 1—Mason City, Ia. Fifth Annual, Mason City Auto Show Assn.

Feb. 26-Mar. 1—Madison, Wis. Seventh Annual, Automobile Dealers' Division of Madison Assn. of Commerce, Union Transfer Bldg.

March 1-15—New York Aeronautical Exhibition, Manufacturers' Aircraft Assn., Madison Square Garden and 69th Regiment Armory.

March — Scranton, Pa. Thirteenth Regiment Armory, Scranton Automobile Assn.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrandt, Manager.

March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.

March 1-8—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.

March 3-8—Columbus, O. Columbus Automobile Show Co., Memorial Building. W. W. Freeman, Manager.

March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.

Mar. 5-8—Quincy, Ill. Quincy Automobile Trades Assn., Armory.

Mar. 10-15—Paterson, N. J. Paterson Automobile Trade Assn., Fifth Regiment Armory. H. MacGinley, Show Manager.

March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

Mar. 10-15—Omaha, Neb. Fourteenth Annual, Omaha Automobile Trade Assn., Auditorium. Clarke G. Powell, Manager.

Mar. 12-19—St. Joseph, Mo Sixth Annual, St. Joseph Automobile Dealers' Assn.

March 15-22 — Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.

Mar. 15-22 — Harrisburg, Pa. Harrisburg Motor Dealers' Assn., Overland Warehouse. J. Clyde Myton, Manager.

March 17-22 — Great Falls, Mont.—Montana Automobile Distributers' Assn.

Mar. 19-22—Norfolk, Neb. Norfolk Automobile Show Assn.

Mar. 22-29—Pittsburgh Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.

Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.

April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager

June 2-6—Hot Springs, Va. Convention, Automotive Equipment Assn., Homestead Hotel.

TRACTOR SHOWS

Jan. 20-25 — Hartford, Conn. Broad Street Armory.

Feb. 15-22—Minneapolis, Minn.

Feb. 24-Mar. 1—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building, Kansas City Tractor Club. Guy H. Hall, Sec.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show, Wichita Tractor and Thresher Club. Forum.

CONVENTIONS

Feb. 4-6—New York. Meeting Society Automotive Engineers.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

Detroit War Contract Claims to Be Settled by March 1

DETROIT, Jan. 18—It is understood that every war contract claim in the Detroit district, and there are approximately $500,000,000 worth of them, will be approved and settled by March 1. Ordnance Department Claim Board officials state that $100,000,000 in cash has been placed at the disposal of their board to cover all immediate adjustments. Red tape has been abolished and every effort is being made to refund the contractor the money tied up in machinery and materials. Bankers declare that many large checks have already passed through their hands and that contractors affected are entirely satisfied with their settlements. Because of the greater amount of work connected with the audit and inventory demanded by the Government before an adjustment is made, the larger munitions makers are still busy, and have not submitted their claims.

Aviator Lands on a Roof.

PARIS, Jan. 19—Jules Vedrines won a $5,000 prize to-day when he made a landing on the roof of the Galeries Lafayette, a large department store near the St. Lazare station. This is said to be the first time an aviator has made a landing on the roof of a building on a flight. Although the machine was slighly damaged, Vedrines was uninjured. The plane he used is 36 ft. wide, and the roof on which he landed is 52 x 75 ft.

Work for Better Roads in Ohio

COLUMBUS, OHIO, Jan. 20—The Good Roads Federation and a number of other organizations held a Road Congress here last week. The Ohio Automobile Trade Association has been taking an active part in this and has appointed a Good Roads Committee, which will cooperate with the Good Roads Federation to secure better roads in Ohio. The association has also appointed a committee of 50, which consists of automobile dealers, who will take up questions pertaining to their own individual business. There are also committees on tires and vulcanizing, garages and repairing, storage batteries, accounting and stock systems, automotive equipment sales, truck sales and legislation.

VOL. XL NEW YORK—THURSDAY, JANUARY 30, 1919—CHICAGO No. 5

Chicago Dealers' Show Has National Aspect

Regarded as Weather Vane of Future Business—Nothing New from Engineering Standpoint

CHICAGO, Jan. 25—Chicago's nineteenth annual automobile show opened to-day with the same crowds, the same attendance of dealers and manufacturers' representatives, and the same general business aspect as in previous years, although this time it is a dealers' and not a national show. Manager Sam Miles, who has conducted all of the previous national motor car shows, is again in charge of the exhibit, and both in the conduct of the affair and in the attitude of manufacturers toward the show it is as much a national affair as ever.

Manufacturers and dealers unanimously look upon this show as the opportunity to again break into normal business activity. Makers of accessories, as well as cars, are here to get business in order that their plants, which are now released from war work, can start production. This show is regarded as the weather vane of business. It will be a dominant factor in determining the manufacturers' sales policies during the coming year. It is regarded as the one opportunity to repair the shattered sales organizations which exist in many instances, due to the claims of war upon the dealers' personnel.

It is not a show of surprises in the form of new models, advanced designs, and altered equipment. Every manufacturer at the show knew exactly what was to be exhibited by his commercial competitors before the doors opened. In this respect the show differs from previous years. In other respects the general aspect is the same, except that there is a more intense interest in the lining up of new dealers by concerns which were not able to produce at all, or only to a very modified extent during the European war.

Exhibitors at Chicago

Type	Coliseum	Armory	Total

8-cylinders	16	16	32
12-cylinders	9	..	9
Total			256

From this general view of the Coliseum some idea may be gained of the elaborate nature of the purple and gold decorations of Chicago's nineteenth annual automobile show

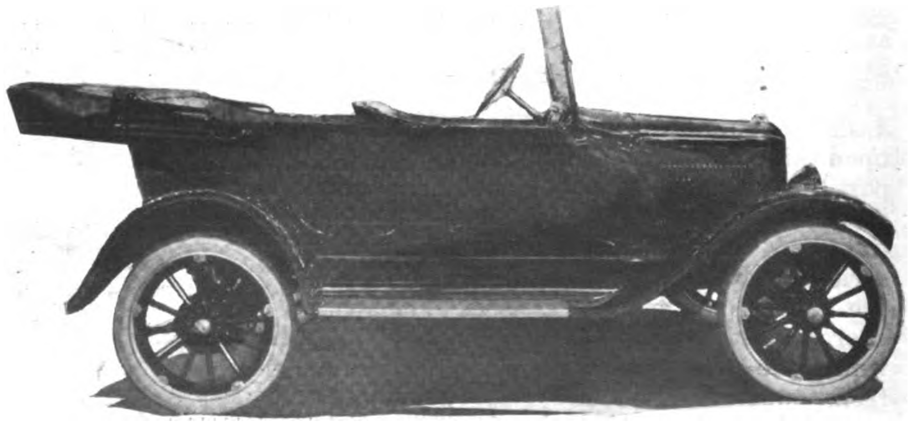
A noticeable feature is the absence of bad weather this year. Chicago is having the same mild winter as the East, with clear skies and a temperature more suggestive of late March than mid-January. The result is that there has been no freight tie-up and all exhibits were on the floor and uncovered when the doors swung open at 2.30, and admitted the crowd which waited. This year the number of exhibitors of cars is 68, and of accessories 135. Last year there were 79 car exhibitors and 146 exhibitors of accessories.

Preponderance of Touring Cars

There was a much greater preponderance of touring cars than would be expected at this season. The total number of touring cars on the floors of both the Coliseum and Armory numbered 116. This is interesting in comparison with the 40 sedans and 20 coupes. The total number of cars at the show was 236 gasoline cars and 9 electrics.

The overlapping of the show dates in New York and Chicago cut down the number of stripped chassis, cutaway engines, and other mechanical exhibits to a large extent, as manufacturers have been in the habit of shipping these from New York to Chicago so that one exhibit would do for both shows. There are only six engines exhibited, two of which are cutaway. The number of stripped chassis is eleven, whereas generally there are two or three times this number. There are three chassis operating so as to show the functions of the parts. Paige has its sawn-in-two chassis which was on the floor last year. The Studebaker gold chassis is replaced this year by one in nickel finish.

It is estimated that the crowd which attended the show on the opening day was 30,000. Dealers have already started to arrive from out-of-town points and it is pre-

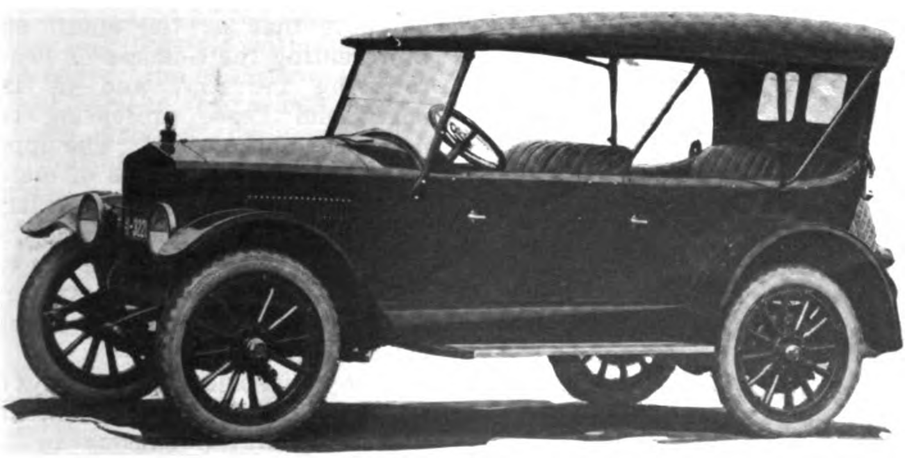


The new small Overland was exhibited for the first time with the body mounted on the chassis

The Armory, too, which held part of the Chicago show, was decorated in harmony with the general plan, hangings and embellishments being in purple and gold throughout

dicted by most of the exhibitors that the attendance of out-of-town dealers would be heaviest on Thursday and Friday. Quite a number of the dealers are planning to attend both shows for the purpose of combining a business and pleasure trip to New York and to look over the lines thoroughly.

There is more color apparent at this exhibition than in previous years. The cars are brighter in hue, and this is not due to an increase in the number of strictly show jobs on the floor, but, on the contrary, due to an increase in the number of stock models painted in other colors than black. To be exact, there are twenty-seven black cars out of a total of eighty-five. The next popular color is green, which is represented by fourteen cars, the shades of green being so different, however, that they can be classed as cars of different colors.



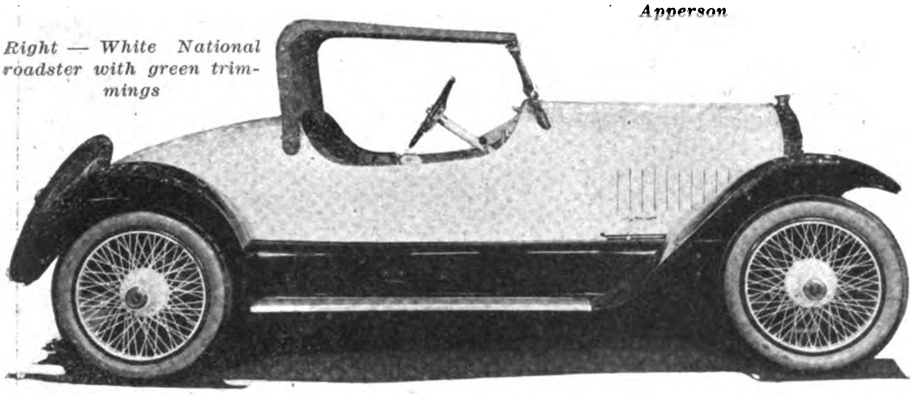
The Essex made its first appearance at any show, and because of its newness attracted a lot of attention

The use of colors other than black is appreciated by dealers as well as by the show visitors. This is evidenced by the fact that it was commented on probably more than any other feature of the show by the exhibitors. The air of individuality given to the cars by these color differences, and carried out further by a greater variety of body line than two years ago, gives a much wider range of choice in selection.

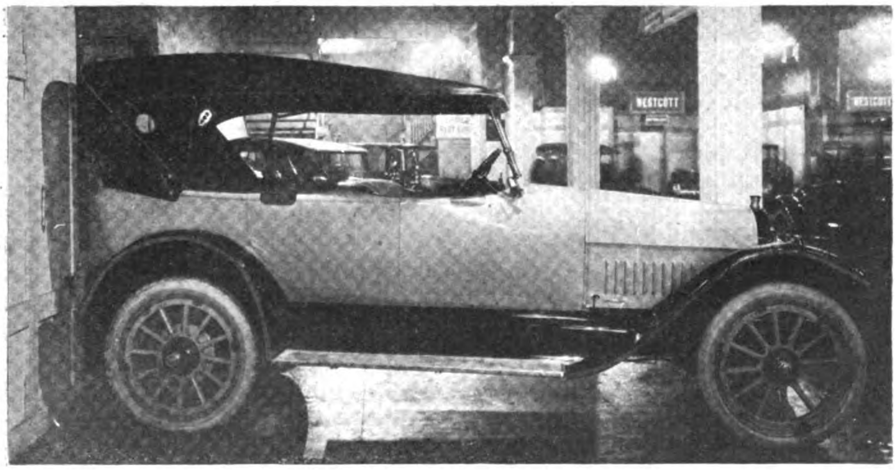
Essex Attracts Attention

From an engineering standpoint there is nothing new at the show. The main attractions from the standpoint of novelty were the first showing of the Ford closed cars equipped with electric starters, the exhibition of the new small Overland in both chassis and complete form, and the showing of the new Essex car, which while previously announced is just getting into manufacture and is furthermore a newcomer at the shows.

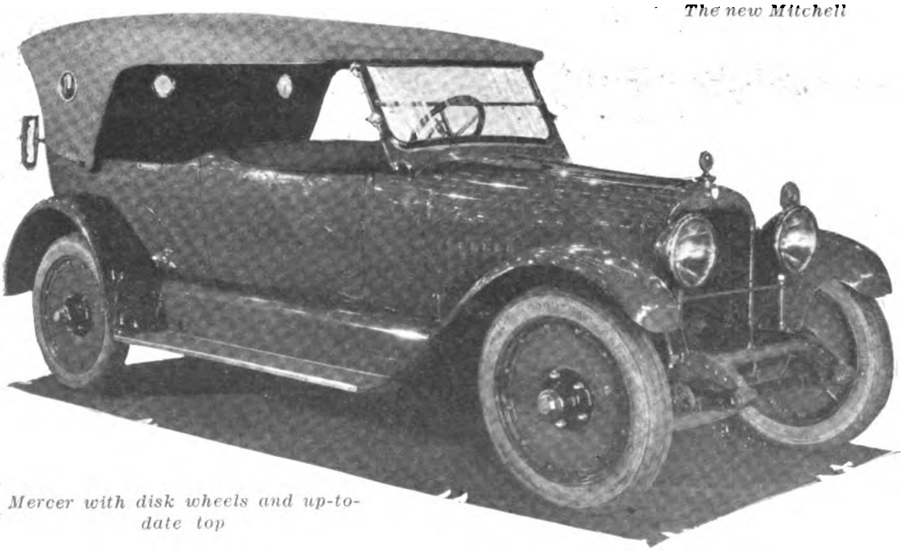
Apperson



Right — White National roadster with green trimmings



The new Mitchell



Mercer with disk wheels and up-to-date top

Concerns which exhibited cars last year that were not yet in production and which were not able to get into production on account of Government restrictions have all taken advantage of the interval to thoroughly test out their cars and eliminate minor imperfections. The result of this is a variety of minor refinements, none of which indicate any marked trends of an engineering nature.

Bevel Edges Increase

In body lines the great increase of bevel-edged jobs is noticeable and there are also a large number of four-passenger cars on the floor which stand out in marked attractiveness, due to the graceful lines made possible by the absence of the deep wheel housings in the sides of the body. The double-cowl type of body is still popular and is represented by a number of makes, but the rear cowl is more subdued than in previous examples of the type.

As an exhibition the present show has all the glamour of its predecessors. The same elaborate decorations and lighting effects are carried out in the Coliseum and Armory as in the past. The decorations are on the same gigantic scale as usual, but a softer color tone is utilized. The main canvas, which forms the ceiling, is decorated with scroll effects of purple and gold; it measures 300 by 240 feet.

About the Decorations

At the ends smaller curtains extend from the ceiling to the lower edge of the balcony, also carrying out the scroll effect. At either end of the Coliseum there is a transparency, that at the south end representing the Goddess of Peace receiving industry, and at the north end Peace presenting the motor car to the world. The upper side shows various types of motor cars in outline. There are thirty-two pillars on the floor of the Coliseum decorated to outline the exhibits, and sixteen in the Armory. The Annex decoration is a Japanese garden effect.

The accessories are mainly on the balcony of the Coliseum, and some are in the balcony in the Armory. The accessory field is in

the same position as the car field as regards new products. Very few of these are to be found at the present time, but there are indications of many improvements to come. Wheeler & Schebler are showing their new line of carbureters for the first time, and there are a number of new tools and garage accessories in the booths along the balcony.

Some Striking Bodies

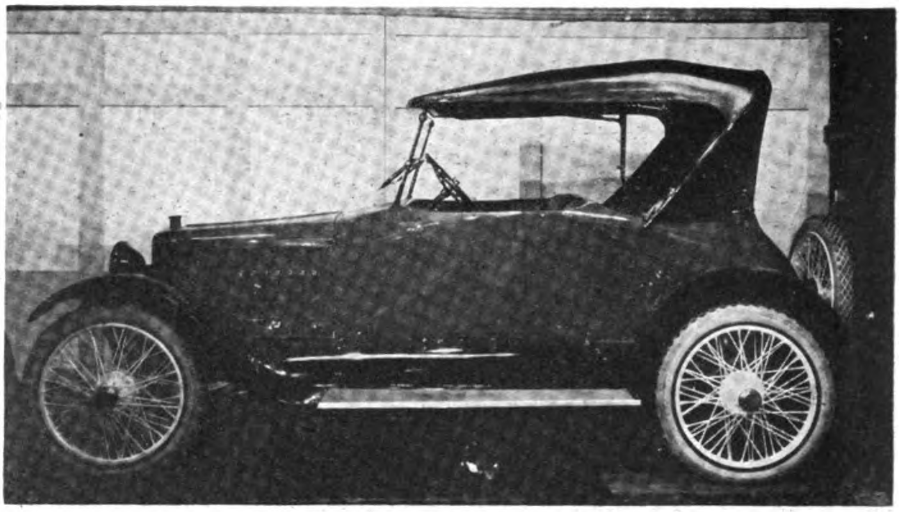
There are some striking body designs, made up as special show jobs, which are of interest as pointing the way for probable future standard body development. One of the features of the show as a piece of fine body work is the National white torpedo roadster with green running gear. This has a tan top. Its low lines and the artistic curve of the top give it an appearance of speed and comfort.

Kissel has a yellow roadster on exhibit which also is attracting attention as a good example of sport work. This roadster has an exceptionally low top and low windshield, which give it its distinctive lines. Scripps-Booth is showing a roadster in maroon in which the curve of the body is continued behind the seat, leaving an open storage space between the back of the seat and the curve of the body. The new little Overland touring car carries out the customary Overland lines exactly.

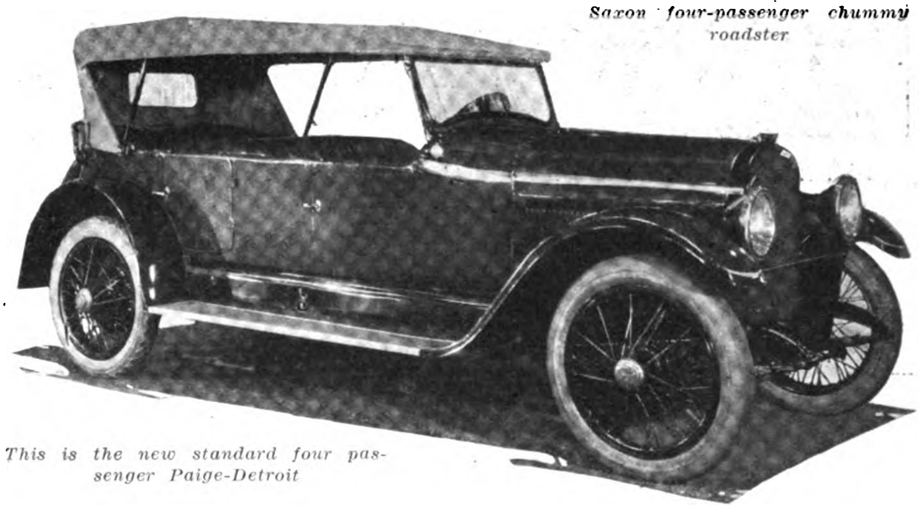
New Four-Passenger Jobs

Among the four-passenger exhibits Paige is showing a car which is put out as a standard body for this year. It is in a shade of blue green with tan upholstery. The car is featured by the long narrow lines only possible with the four-passenger type of design, and has a low, well-cut top which gives it a very striking appearance.

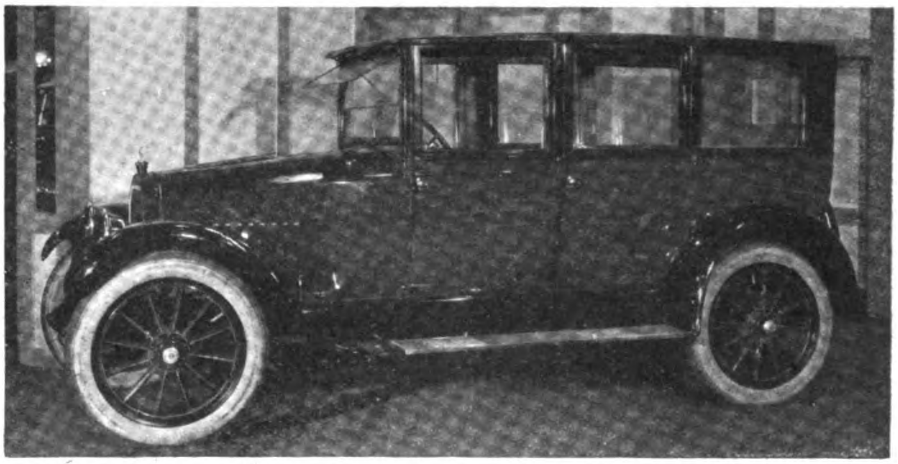
The Holmes car, which made its first appearance at New York last year in an office building near the Palace, is exhibited at the show this year in the Annex. This is an air-cooled car and the particular model on the floor is in a striking shade of blue with a tan front hood, in which the tan painting is brought back in a V shape toward the cowl. Essex also has its cars in the Annex, the exhibit being

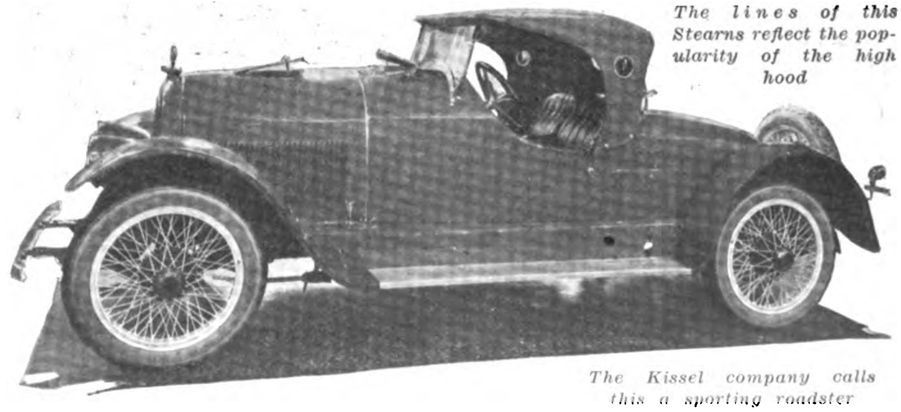


Saxon four-passenger chummy roadster



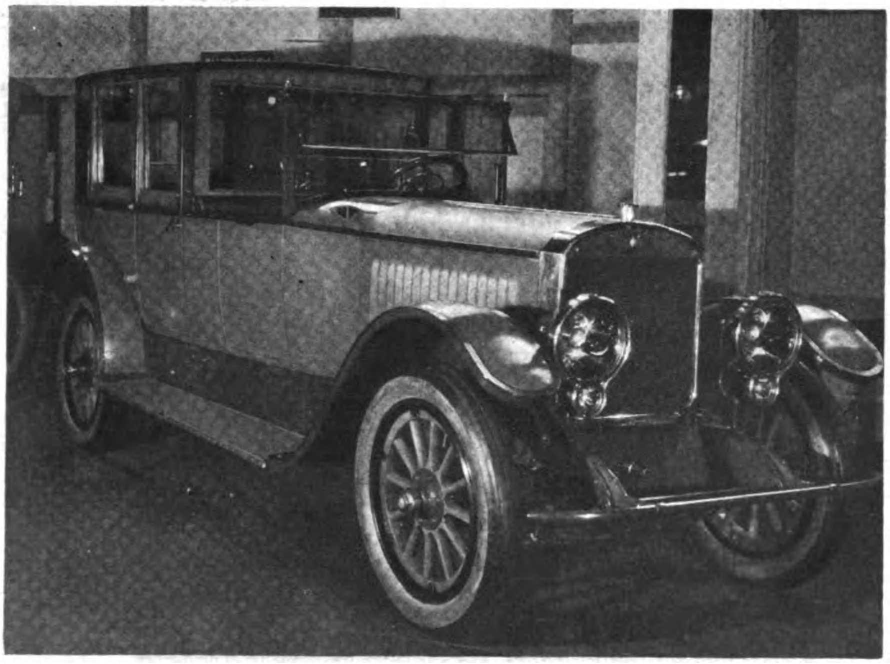
This is the new standard four passenger Paige-Detroit





The lines of this Stearns reflect the popularity of the high hood

The Kissel company calls this a sporting roadster



This Winton limousine was the largest car on view. The radiator cap is practically shoulder high

three standard touring cars in the standard blue green shade. As one of the new exhibits this car is attracting the crowds. Missing from the show this year are the steam cars, there being none of this type to be found.

There are indications that there is going to be greater individuality in body design during the coming year than ever before since the earliest days of car manufacture. Probably as striking an example of sport carwork as can be found anywhere on the floor is the Daniels, which is showing a five-passenger sport design in light blue. This has a double cowl and has steps on the side instead of a runningboard. It is completely outfitted as a sport job, even having a golf bag to match the body carried in a support on the side of the body.

Apperson is showing a good example of top work in which a detachable gypsy curtain is utilized to conceal the top bows. There is an inside as well as an outside flap to the gypsy curtain which conceals the bows, both inside as well as outside of the car. In fact, one of the features of the show throughout is the great improvement in tops; instead of the ugly square, angular rear to be found on tops in the past every one has endeavored to secure a graceful curve which is enhanced by the practically universal employment of plate glass for the rear curtain lights.

Experiments on Flame Propagation

WHEN a mixture of gas and air is ignited within a closed vessel, the flame travels through the mixture in a manner and at a rate which depend upon the nature and the proportion of the gas, the position of the point of ignition, the intensity of the means of ignition, the shape and size of the vessel, and also upon the agitation of the gas mixture. The latter factor is of importance in gas engines where turbulence may be set up during the introduction of the charge. Professor R. V. Wheeler has recently studied these phenomena in mixtures of methane and air at Eskmeals (Transactions of the Chemical Society, November, 1918, pages 840 to 859), with particular reference to the development of pressure and to the speed of the flame propagation. Using spherical vessels (machined bronze castings) of 19.5 cm. and 31.5 cm. diameters and capacities of 4 litres and 16 litres, and mixtures containing from 6 per cent to 13.9 per cent of methane—the lower and upper limits of inflammability are 5.6 per cent and 14.8 per cent of methane—he observed a maximum pressure of 6.97 atms. (above atmospheric pressure), both in the big and small vessels, for the 10 per cent mixture. His values were lower than those of Le Chatelier and Mallard (1883), who obtained irregular values, however, but agreed better with those of Beyling (1902), who experimented with cylindrical vessels of 42 litres and 11 litres capacities. Le Chatelier had also used cylinders of 17 cm. diameter and height, and, like Wheeler, central ignition. In spherical vessels the flame probably travels as a spherical wave; in cylindrical vessels the flame may touch some portions of the cool wall earlier than others. Wheeler found that the flame would, in the latter case, travel upward and downward at the same speed in mixtures containing from 7.5 per cent to 12.5 per cent of CH_4, but would travel faster upward in mixtures outside that range. The maximum pressure observed need not come up to the full theoretical pressure attainable, for apart from radiation and conduction

Refinement in Detail Principal New Feature at Chicago

Mixture, Temperature and Chassis Lubrication Subjects of Study—Bevel-Edge Bodies Popular, But Often Faulty

By J. Edward Schipper

FROM an engineering standpoint the greatest feature of interest at Chicago is the refinement of detail. No radical departures from previous practice can be found and what there is that is called new has already been discussed and the details previously published. The Essex is on the floor for the first time and the new Overland small four which was shown last year in chassis form now appears with its complete body as well. Ford has the electrically-equipped closed cars on exhibition. Mitchell has a refined car which will be at its showroom early in the week, but which has not made its appearance on the floor of the Coliseum.

Mitchell's new car is a refinement of its smaller six-cylinder model, bringing it more in line from a production standpoint with the larger car and at the same time considerably improving it. The rear axle is being changed and the same axle as is used for the larger car will now be used for the smaller. This is a Mitchell product and is full floating, replacing the three-quarter floating type previously bought outside. The cone clutch is now being replaced by a Borg & Beck disk, and the tire pump is also being increased in size. A larger bevel-edge body is also fitted.

The electrical system used on the Ford has been made a production proposition and it is freely predicted will soon be standard equipment on all Ford cars. It is manufactured by the Liberty Starter Co., Detroit, and is a two-unit, 6-volt type with the generator mounted on the right side of the engine, taking the drive from the timing gears. The starting motor is mounted on the left side and drives through the flywheel. The car is also fitted with an ammeter mounted on the dash and a Yale switch lock. The rims are now demountable and 30 x 3½-in. tires are used all around. This car sells for $850 f.o.b. Detroit.

Throughout the exhibits there has been a checking over of tire sizes so as to bring these in line with the Government specifications. The use of disk wheels on an increased number of cars is

The cleaning up of chassis lubrication problems is one of the noticeable features of the various models on view. Here are a few examples showing the use of oil cups to replace grease cups

noticeable, this of course being special equipment. The Disteel wheel is on quite a few of the special show cars.

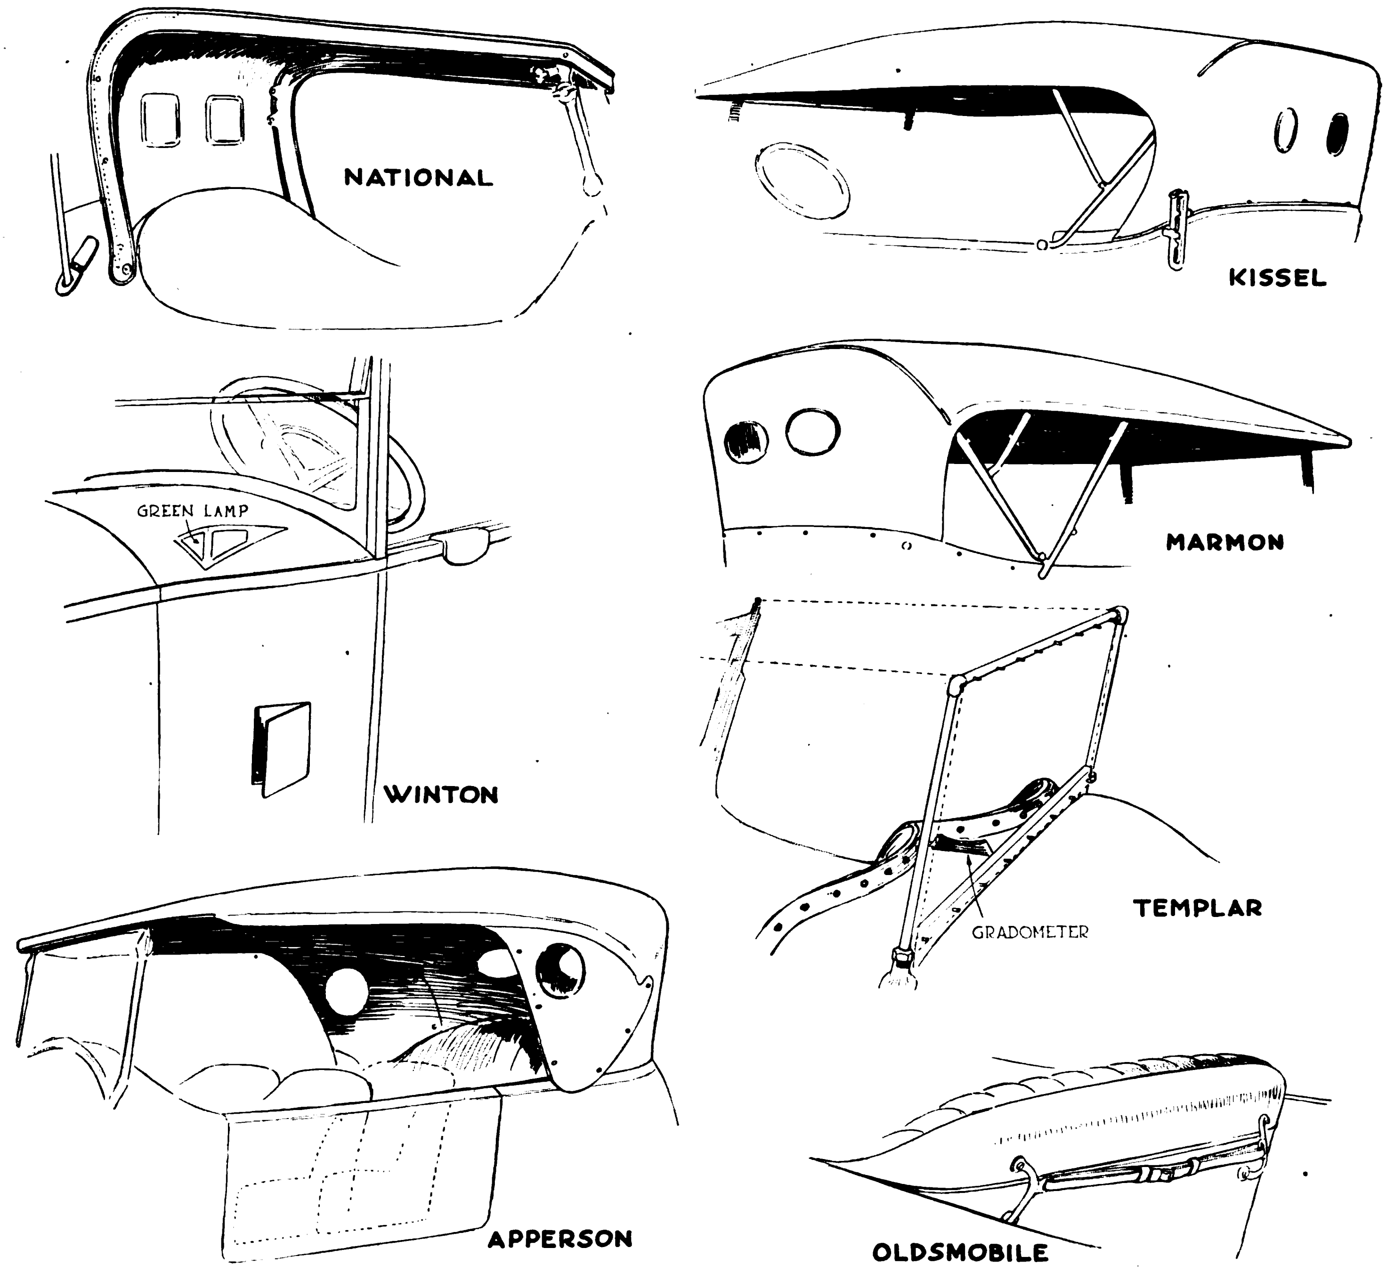
If there is anything of engineering importance to be noted it is the cleaning up of chassis lubrication questions. This does not by any means imply that the inaccessible grease cup has been done away with, because this is not so. It is there in just about as great numbers as at the show last year. There has, however, been an increase in the use of oil cups for spring shackles. The cars on the floor with oil cups on the shackles include Maxwell, Studebaker, the new Overland, Haynes, Oldsmobile, Packard, Nash, Franklin, Briscoe, Mercer, Cole, Kissel, Westcott, Premier, Stutz, Elgin, Liberty, Paterson, and Jordan.

Some of the cars are using self-lubricating bushings at the shackles; these include Holmes, Lexington, Moline, and Marmon. A number of the above cars use oil cups on the steering knuckle pins, although this practice has not become nearly so well represented as the practice of using the oil cups on the shackles.

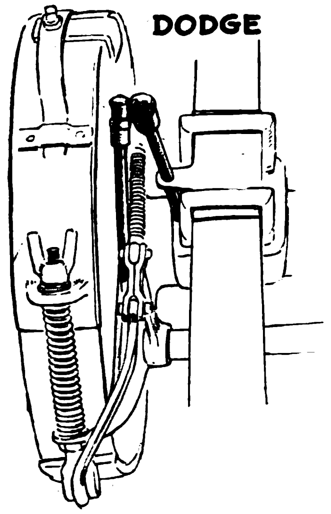
Another feature that is receiving attention is that of the admission of heat to the air intake. Where a lack of foresight may be noticed is in the possibility of controlling the heat. There should be some sort of damper or by-pass which will allow of the admission of air at atmospheric temperature during warm-weather operation. Some of the cars are using a damper which can be adjusted by means of a screwdriver. It would seem that the better way is to follow the practice of others and make the heat control a matter of hand adjustment.

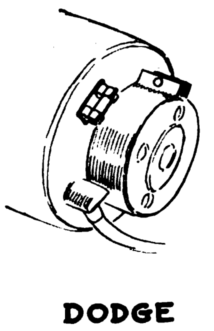
Nash has a linked control by means of which the heat entering the mixing chamber is controlled by the motion of the throttle. At low throttle opening when the heat is required, it is admitted, and at wide-open throttle the heat is shut off from the mixing chamber. The heated air intake, however, is used continuously.

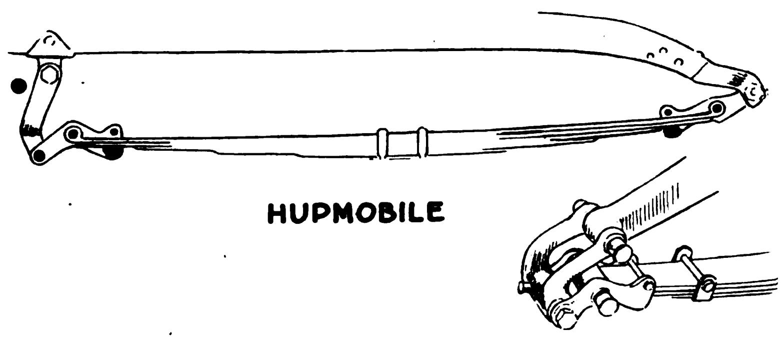
A detail that is growing in popularity with designers



In general, tops appear to be slightly lower, and in many cases gypsy curtains are being made to cover the rear bows. The use of plate-glass windows gives evidence of growing in popularity







A FEW EXAMPLES OF REFINED DESIGN

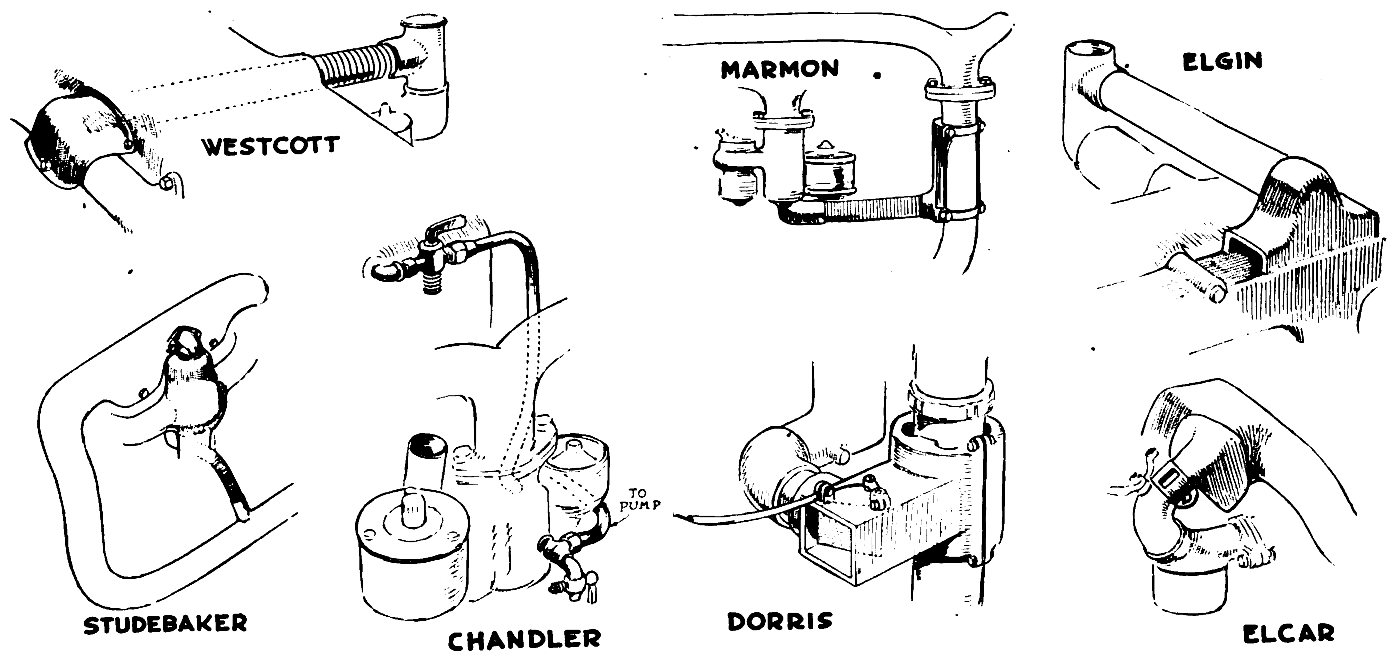
Dodge makes sure of the lubrication of the internal brake mechanism by providing an oil cup at the end of a tube; the generator fuse is located directly on the generator. In one of the Hupmobile models there is a new type of combined spring shackle and shock absorber

is the use of a cross-member at the front extremity of the frame. The cross-member is usually of tubular construction and is not only a stiffening element in the frame itself, but also is of value as a bumper in case of collision. National, Hudson, Mercer and others use this to advantage.

From the standpoint of body design probably the most noticeable feature is the increase of the bevel-edge bodies. From what can be seen at the show it would appear that the use of this type of body should not be attempted by makers who cannot afford to put the best workmanship and materials into the body. In the low-priced body where the material used is of light gage not well reinforced, the bevel edge is hard to keep in a straight line and the result is a very loose-jointed appearing job.

The largest car at the show is a Winton limousine. The chassis is the larger Winton six and the body is by Kimball of Chicago. The size of the car may be judged from the fact that the radiator cap is level with the shoulder of a man of average height. As a rule the makers are going to smaller bodies, and the four passenger type with its narrow lines is making an appeal this year. It is very probable that a six-passenger design carrying out the lines of the four-passenger with the extra seats well upholstered and folding neatly into the backs of the front seats would prove popular. It is surprising that there are no six-passenger jobs shown.

The cars at the show with bevel-edge bodies include all price classes and number among them the following: Studebaker, Hudson, Haynes, Cole, Kissel, Westcott, Lexington, Winton, Scripps, Stearns, Liberty, Essex, Paterson, Jordan, Case and Dorris. In a great many instances these cars are four-passenger design in which the hood is higher than the straight side of the body. Paint colors are in great variety and these four-passenger cars in particular are colored to accentuate their individuality.



SOME EXAMPLES OF HOT-AIR EQUIPMENT

On all these carbureters, except the one used on the Chandler, makers have provided for supplying hot air to the mixture. Chandler prefers the use of a water-jacketed carbureter

Production and Import of Tungsten Ores

A Slight Falling Off as Compared with the Two Preceding Years—Tungsten Important as an Alloy in High Speed Tool and Valve Steels and as a Material for Incandescent Lamp Filaments, Electric Contact Points, Etc.

THE production of tungsten ores in the United States in 1918, according to preliminary statistics collected by Frank L. Hess of the United States Geological Survey, Department of the Interior, was equivalent to 5065 short tons of concentrates, carrying 60 per cent tungsten trioxide, of which 5015 tons, valued at $5,156,500, was marketed or consumed by the producers and 50 tons was reported as left on hand at the mines at the end of the year. Although the output was very large, it was less than that of the 2 previous years—1916, with 5923 tons, valued at $12,075,400, and 1917, with 6144 tons, valued at $6,783,400. The production in 1917 was the largest made by any country, although it was much smaller than the combined output of the countries under British rule.

Colorado regained its lead as the largest producing State, with 1910 tons of ferberite, against California's 1781 tons of scheelite and Nevada's 885 tons of scheelite. In 1917 California had "led by a nose," with 2781 tons, against Colorado's 2707 tons, though in 1916 Colorado had produced 2401 tons to California's 2171 tons. Nevada's output was 689 tons in 1916, 143 tons in 1917, and 885 tons in 1918.

Large Production of Scheelite

One of the remarkable developments of the year was the large production of scheelite in the Great Basin region from the contact-metamorphic deposits, limestones altered by solutions accompanying intrusions of granite. Much the larger part of the ore mined in Nevada; in fact, all reported except that from the Tungsten Dyke mine at Sodaville was taken from contact-metamorphic deposits. The deposits at Bishop, Cal., also furnished a considerable quantity. Altogether the contact-metamorphic deposits gave an ouput of 1413 tons. In the Eugene Mountains, about 7 miles northwest of Mill City, the Nevada Humboldt Tungsten Mining Co. and the Pacific Tungsten Co. erected mills which began work late in the year. A pipe-line 22,000 feet long, to bring water from wells in the valley of Humboldt River, two pumping stations to lift the water more than 1100 feet to the mines, and a power line 32½ miles long to bring electricity to them were built by a mutual subsidiary company, the Mill City Development Co. A tramway 3½ miles long, with a gasoline locomotive and steel cars, hauls the ore of the Mill City Mining Co., a closely related concern, to the Pacific Tungsten Co.'s mill. The mines have gasoline hoists that will soon be replaced by electric hoists. Earlier in the year these companies shipped their ore to the mill of the Humboldt County Tungsten Mines & Mills Co. at Toulon, 60 miles southwest of their mines, for treatment. This company also treated ores from its own mines and from a number of other properties.

At Bishop, Cal., the Standard Tungsten Co., which had been working contact-metamorphic deposits, ran out of ore and after re-treating a part of the tailings closed its mill. The Pine Creek Tungsten Co. began active work on the development of a contact-metamorphic deposit about 25 miles northwest of Bishop, at an altitude of about 11,000 feet. The country is very rough and steep, and many miles of road had to be constructed. It is expected that the mill will be put in operation in 1919. The altitude is so high that during a large part of the year snow hampers operations unless they are carried on under cover.

The famous mine of the Atolia Mining Co. at Atolia, Cal., made a much smaller output in 1918 than in 1917 but was still the largest producer in the United States. In the Boulder, Col., field ferberite was taken from the principal mines in quantity comparable with that mined in 1917, but the output from the lesser mines was so much smaller that the total dropped nearly a third. The Wolf Tongue Mining Co. had bonanza ore in its Cold Spring mine and was the largest producer in the district.

In Arizona the production was equivalent to about 213 tons of concentrates carrying 60 per cent tungsten trioxide, valued at $245,000, and it included wolframite, hübnerite and scheelite. The Yucca Tungsten Co. was the largest single producer.

The Homestake Mining Co. produced considerable wolframite from the replacement deposits at Lead, S. D. The production of other tungsten ores in the Black Hills was so small as to be negligible. A small quantity of scheelite was produced in Utah, and a little hübnerite was taken from Blue Grouse Mountain, near Deer Park, Wash.

Prices

The prices of tungsten ores were fairly steady during the greater part of 1918. Scheelite that was free from phosphorus, sulphur and other harmful impurities brought about $25 a unit most of the year. The other minerals brought from $18 to $25. Impure ores were always a matter of bargaining. Toward the end of the summer and in the fall the demand was very heavy, owing to the huge orders of the Government for war materials. With the signing of the armistice on Nov. 11 orders were canceled, the demand slowed down and prices fell accordingly. At the end of the year wolframite of good quality that carried more than 60 per cent of tungsten trioxide was offered in New York for $12 a unit.

Imports

The imports during the year were much the largest ever made; for the first eleven months they amounted to 10,448 short tons, valued at $10,224,668. As nearly as can now be determined, 3581 tons came from South America, 6465 tons from China, Hongkong and Japan; 260 tons from Mexico, and 142 tons from other places, though it may have been transshipped from Asia or South America. The ores credited to China and Hongkong are of course all Chinese, though part of them may come from the British-controlled mainland. The ores credited to Japan are probably also largely Chinese but are shipped by way of Japan by Japanese firms.

The largest Asiatic shipments of the eleven months were those of November. The Chinese deposits are alluvial and are now probably mined more cheaply than any others in the world.

—

Warning Against Waste of Natural Gas

A word of warning is being uttered by C. G. Gilbert, Curator of the Division of Mineral Technology, U. S. National Museum, with regard to wastefulness in the handling and use of natural gas, in a foreword to a technical paper by S. S. Wyer, published by the Bureau of Mines.

Natural gas, says Mr. Gilbert, is the least appreciated, consequently the most abused, of the mineral resources in popular use. The issues involved are of direct concern to some ten millions of the inhabitants of the United States, and their range of influence does not stop even here; for they form a prominent feature in the nation-wide problem of fuel supply which may be solved effectually only through coordinated attention to the component parts.

WANTED—SANE HANDLING

Labor Situation Does Not Warrant Hysterical Outbursts—Condition Only Temporary

INVESTIGATION BY AUTOMOTIVE INDUSTRIES REVEALS FACTS

If All Men Withdrawn from Industry for War Purposes Were Reabsorbed, It Would Still Require About 2% More to Take Care of Probable Productive Necessity for This Year

By Harry Tipper

THE public agitation in connection with the question of the readjustment of labor due to the return to peace conditions continues unabated. There is now before Congress a bill to restrict immigration for a period of 5 years on the plea that there is not sufficient employment for the workers now in this country, and that widespread immigration is likely to occur which may lead to destructive competition in labor circles.

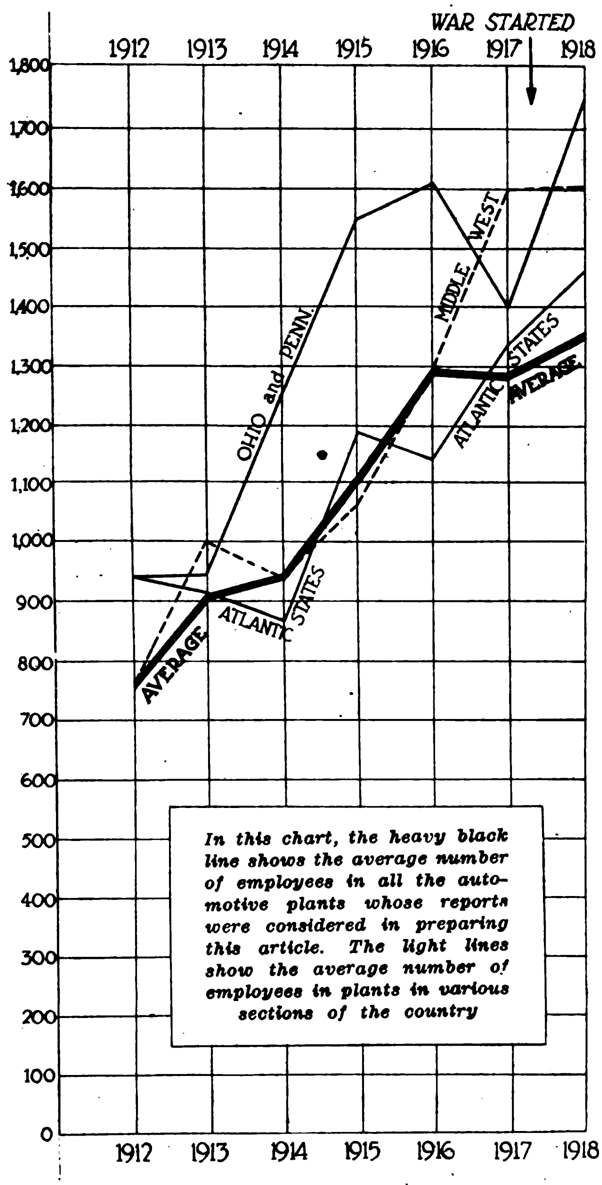
Newspaper articles are appearing from time to time expressing a fear of the growth of Bolshevism and unrest due to increasing unemployment and the difficulties of readjustment.

On the other hand authorities who ought to be acquainted with the matter state that there is no surplus of labor in this country, and that the question is one of movement of labor from its present location to spread it out over the surface of the country where it is naturally required for the continuance of peace production.

To some extent all these views have at least a temporary basis in the actual conditions of the moment.

It is true that there is considerable unemployment, particularly in the coast cities in the East and the large manufacturing centers.

It is also true that there is



some difficulty in placing the returned soldiers at work as they are demobilized, and it is probable that the labor readjustment will mean sufficient difficulty in various localities to provide a reason for a certain amount of unrest and a certain amount of dissatisfaction with the government.

These, however, are only temporary conditions, and unless they are likely to become permanent they do not justify the hysteria which has been exhibited in the discussions upon the subject; and they do not justify such drastic measures as Congress is proposing in connection with immigration.

Analysis of Condition

During the four years previous to the European war the total number of immigrants into this country amounted to a little over 4,100,000. During the war there have been taken out of industry for war duty something over 4,000,000 men, and there have been introduced into industry not more than 300,000 women.

The immigration during the war amounted to just over 1,000,000, or a shortage of a little over 3,000,000, leaving a matter of 1,500,000 to 2,000-000 who must be returned to industry in this country over and above the normal supply which would have been secured during the same period by the usual process of immigration.

There are in all upwards of 20,000,000 workers in this country of all kinds, and the reports of total unemployment according to the labor organizations whose reports are not likely to be underestimated amounted to 210,000 at the time this article is written, or approximately 10 per cent of the total labor of the country.

On the other hand, the United States Employment Bureau reports that in forty-four states during the week of Jan. 11 there were 153,763 applications for jobs, of which 99,000 were placed, but that during the same week the employment service received 202,757 applications for help, *or nearly* 50,000 *more applications for help than there were applicants for jobs.*

From all the figures which can be secured from all interested sources there is no evidence showing actual surplus of labor in the country in any more important sense than a survey in September, 1914, would have shown in actual surplus.

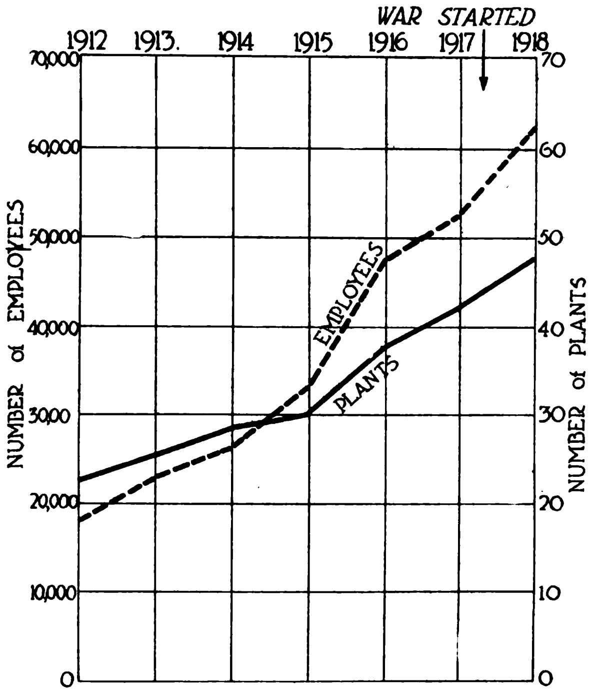


Chart showing the increase in the number of plants and the increase in number of employees during 7 years

The beginning of the European war showed a very pronounced drop in industrial activity for some little time, with a corresponding surplus of labor for a few months. But this surplus was occasioned only by the temporary financial condition and did not indicate more people for the work than were necessary to continue the country's business.

It is evident from the reports which have been received from most of the states that the unemployment is due to four causes:

1—A desire of returning soldiers to engage in new occupations and to settle in new parts of the country. In New York City the Red Cross, the Knights of Columbus, the Y. M. C. A. and the United States Employment Service have all noted the large majority among the demobilized soldiers applying for jobs whose homes are in different cities scattered all over the country, but who do not wish to go home if they can avoid it. In the writer's own little office, out of twelve applicants for work in one week, all of them returned soldiers, only one lived in the vicinity of New York, and a personal examination of the record in a number of offices in this city discloses approximately the same condition.

Cancellation of War Orders Increases Unemployment

2—The shutting down of employment in war industries due to the cancellation of war contracts. This has resulted in the sudden increase of the ranks of the unemployed by thousands of laborers, skilled and unskilled, who have up to this time been making unusually large pay. These workers do not attempt until necessity drives them any other work at a lower rate, and they will not move away from the manufacturing centers except under the same conditions.

3—The dilatoriness of the Government in legalizing in former contracts the red tape surrounding the cancellation of contracts, and the inability of the manufacturer to proceed with production plans with the existing unsettlement of all its financial arrangements. There is no excuse for this governmental waste of time in the settlement of these matters, notwithstanding the desirability of preventing undue profiteering. There was no hesitation in writing off more than $1,000,000,000 of the cost of the merchant marine in order to put it upon a competitive basis, and there seems to be no hesitation about the guaranteed price of food products with the producer of food. The length of time occupied by the present hesitation about production and the severity of the disturbance itself are greatly affected by the action of the Government in connection with these contracts, which are very numerous and which involve billions of dollars.

4—The tendency of all parties concerned, whether the leaders of organized labor or individual manufacturers or politicians, to use its period and its present uncertainty in order to gain an advantage and not unitedly attempt to solve it. There is a great deal of junkerism in all official bodies, and particularly in the bureaucracy which represents them, and there is nothing much to choose between the political junkers who see in a disturbance only the means of pushing their particular theory of politics and the labor junkers who use this disturbance primarily as a means of increasing the power of labor, the industrial junkers who see in it an opportunity to regain control of the labor bargain.

As the third largest industry in the country, the automotive industry is deeply interested in the size of this question, in the means which must be taken to settle it, and in its political significance.

Investigation Made in Automotive Industry

For this reason a survey has been conducted through the industry in the attempt to determine the present condition, the way in which the employment has been effected by the war, and the possibility of reabsorbing rapidly the workers who were taken away for war duty and who may have been involved in the reduction of activity.

From the chart which is shown it will be observed that in the automotive field, out of approximately 125 concerns investigated, the increase in employment required by the growth of the industry calculated on the basis of the average number of employees to a plant per year showed 18 per cent as between 1912 and 1913, 3 per cent as between 1913 and 1914, the drop in this respect being due directly to the reduction in industrial activity at the outbreak of the European war; as between 1914 and 1915 this rose again to 18 per cent. It showed 17 per cent in 1916.

The restrictions imposed upon the industry by our entry into the war are indicated by a decrease of 1 per cent in 1917 over 1916, and the recovery from these conditions is indicated by an increase of 5 per cent between 1917 and 1918.

In the three years of normal activity for which the figures are given, that is, in 1913, 1915 and 1916, the increase is almost exactly the same, varying only 1 per cent in any one year from the other years. It is a little in-

teresting to note that the average number of employees who were drawn from the industry from these same establishments for war purposes is 17 per cent, or almost exactly the yearly increase in employment in a normal year.

If all the men who were withdrawn from the industry for war purposes were reabsorbed into the industry, it would still require about 2 per cent more in order to take care of its probable productive necessities for this year. This, however, must be taken in conjunction with the reductions which have occurred in some of the plants in the last month.

These reductions average about 6 per cent of the total number of employees reported, and they could be taken care of by the necessities for increased forces in a number of the concerns reported.

It is interesting to note that while the automotive industry did a great deal of war work, this was confined to a comparatively small number of concerns. The larger portion of the concerns in this industry were restricted by the war in their activities without receiving any corresponding compensation in the nature of war work. Their mechanics were absorbed into other industries or into the larger plants, and they are now attempting to rebuild their organizations.

Most of the concerns which were on war work report temporary reductions in employment to the extent of from 10 to 30 per cent. Most of the concerns who were not engaged upon war work report a necessity for increasing their working forces anywhere from 5 to 50 per cent.

It is very evident that the process in the automotive field is one of readjustment. Even in the plants which have been engaged on war work the increase in employment has not been very abnormal.

One concern, for example, that has been extensively engaged in work for the Government increased its employees in 1915 over 1914 by 1700. In 1916 it increased over 1915 by 1300. In 1917 it increased over 1916 by 2600, and in 1918 it increased over 1917 by 1600, showing that its increase on account of our entering into the war was less than the increase necessitated by the demand upon us from our Allies.

A number of other facts are brought out by this analysis resulting from the information secured from the actual manufacturers in the automotive field which illuminate the labor situation still further.

In the reports from the East it is interesting to note that all the reports from Buffalo show a surplus of labor. A majority of the reports show a surplus of both skilled and unskilled, while the other reports indicate a scarcity of the unskilled. Syracuse also shows a surplus of both kinds; Rochester a surplus of semi-skilled, by which is evidently indicated machinists that were trained during the war to operate a certain machine in a few weeks' time.

But the small manufacturing towns in the northern part of New York State, such as Binghamton and Jamestown, are still suffering from a scarcity of labor, or at any rate have no surplus.

It will be some time probably before the labor which is unemployed in Buffalo will have spread itself over the smaller manufacturing towns in that area.

The same difference in the situation is to be observed in Pennsylvania and Ohio. Philadelphia, Pittsburgh, Harrisburg, Cleveland and Springfield report considerable surplus, while the smaller towns in the same state are not yet aware of any increase in the applications.

It is obvious from the survey that reductions in employment which have taken place in the automotive field affect only about 25 per cent of the firms reported, while increases affect about 35 per cent.

The number of employees affected by the reductions is slightly larger than the number of employees demanded by the increases, but the demand is not sufficiently great to indicate any real diminution of activity even temporarily, and in most cases it is expected evidently that the reductions which have occurred will only be enforced until about March or April, by which time the operations will have become sufficiently near normal to permit of the organization going ahead on the full complement of men.

It would be of great advantage to the automotive field if the manufacturers who are interested in their organization activities in the localities would institute activities looking to the more rapid transfer of labor from the manufacturing centers to the smaller industrial towns, and from the East, particularly the coast cities, to some of the sections in the interior where there is still a scarcity of labor and no immediate prospects of getting all the labor that is required.

The propaganda which has been established from various sources is unfortunate because it has led to a misconception of the matter, and the problem is conceived to be of far greater proportions than it actually assumes.

Even conceding the estimates of unemployment issued by the labor organizations, the problem is not nearly so severe as it was in 1914, when the beginning of the European war practically stopped industrial activity in this country for several months. *The problem requires sane, common sense handling and not the hysterical outbursts which have been so much in evidence in the newspapers and general publications.*

Extinguishing and Preventing Oil and Gas Fires

DURING the period of 10 years from Jan. 1, 1908, to Jan. 1, 1918, approximately 12,850,000 bbl. of oil and 5,024,506,000 cu. ft. of gas were destroyed by fire in the United States, entailing a total estimated property loss of $25,254,200. During this period 503 fires were reported. Three hundred and ten of these fires were caused by lightning and 193 by all other causes. The losses from the fires caused by lightning were estimated to be $11,148,000, and from those due to all other causes $14,106,200. Directly and indirectly, the fires resulted in the deaths of nearly 150 persons and were responsible for almost as many more being permanently disabled.

For the past three years the Bureau of Mines has been conducting investigations to determine the nature and the specific causes of these fires, with a view to suggesting means whereby they may be successfully combated and, in some places, perhaps eliminated entirely. The results of this investigation are given in Bulletin 170 of the Bureau of Mines, by C. P. Bowie.

As the subject of oil and gas fires is necessarily broad, no attempt is made in the bulletin to treat it exhaustively; rather the bulletin aims to point out what has been done by operators in the past, and to describe various fire-prevention methods and fire-fighting apparatus which are being used or adopted by many of the larger oil companies. These methods and apparatus, it is believed, if universally employed by operators, will largely decrease the present enormous losses.

Wismach American Gage Blocks—Correction

IN the article on the above named blocks in AUTOMOTIVE INDUSTRIES of Dec. 5, the limit of accuracy of these blocks was erroneously stated to be 1/10,000 in. This should have been 1/100,000 in.

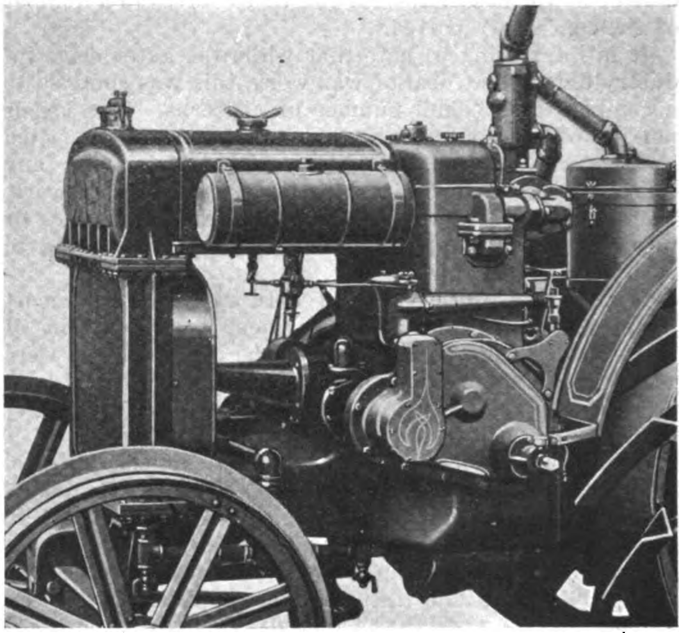
Case 15-27 Hp. Tractor

New Addition to the Case Line Embodies the Same Unit Construction as the 10-18 Hp. Model—Burns Kerosene or Distillate and Is Rated as a 3-4 Plow Tractor

By P. M. Heldt

WHILE the J. I. Case T. M. Co. of Racine, Wis., has long been prominent in the tractor field, and for years has been marketing a complete line of tractors, a little over a year ago it began to redesign its machines on lines in accordance with the latest ideas in the tractor industry. The first model of the new line was the 10-18 hp., a 2-plow machine which was fully described in AUTOMOTIVE INDUSTRIES of April 18, 1918. Recently the company has come out with another model, embodying the same features, known as the 15-27, which is the particular subject of this article. The present line is completed by a third model, rated at 20-36 hp., and capable of pulling 4-5 plows. The latter machine is equipped with a four-cylinder 5½ x 6¾-in. engine. The design of transmission is almost identical with that of the two smaller sized tractors, except that the differential is located on the jack shaft, which is geared to both rear wheels. All the gears on this larger tractor are inclosed and run in oil. This model, however, does not embody the unit construction characteristic of the two smaller models, the engine, transmission and rear axle housing being independent, supported by a frame of channel steel.

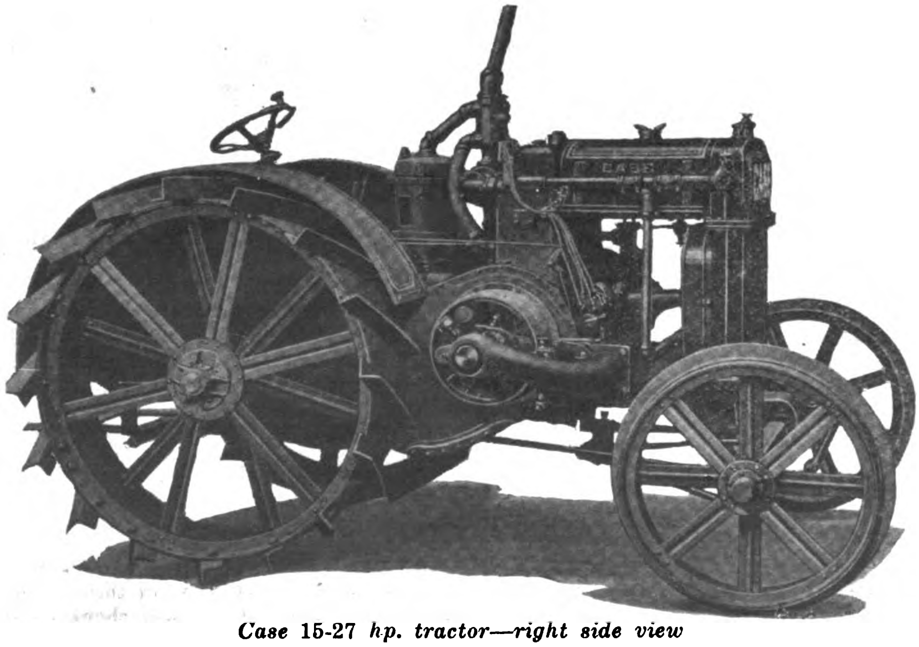
The most interesting feature of the Case 15-27 tractor is the main frame, which is a single iron casting so designed that in addition to serving as a frame it also serves as the main part of the transmission case, the crankcase and the rear axle housing. This construction permits all the main bearings of the engine, transmission and axle to be machined in this one casting, which makes it impossible for them to get out of alignment. At the front end of the main frame there is a cast steel extension which is firmly bolted to the main frame. To the center of this extension is pivoted the front axle, thus giving a three-point support to the main frame and allowing the wheels to accommodate themselves to uneven ground surface.



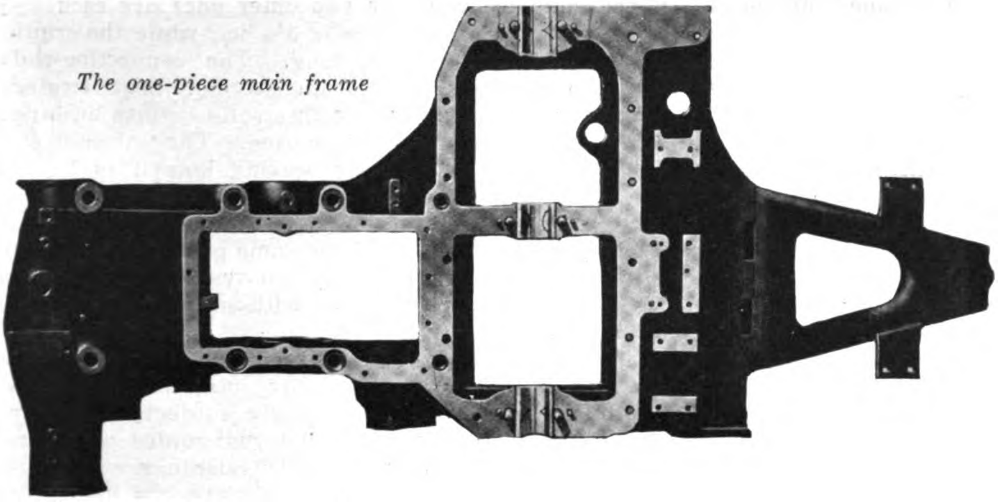
Left side view of forward part

The main frame casting is machined on special milling and boring equipment. The bores for the rear axle bull pinion shaft, first reduction shaft and main engine bearings are bored in one operation. This insures absolute alignment of these parts, which cannot be changed in the process of erecting.

The front axle is of the automobile type, both the axle proper and the steering knuckles being drop forgings. A worm and wheel steering device is used, and the tractor is said to be quite easy to steer. The rear axle is mounted in roller bearings in the axle housing forming part of the main frame casting. Roller bearings are also used throughout the transmission, and are carried in a dustproof case. The tractor can be turned around in a circle of 27 ft. 3 in. outside diameter. The drawbar is so connected to the tractor as to bring



Case 15-27 hp. tractor—right side view

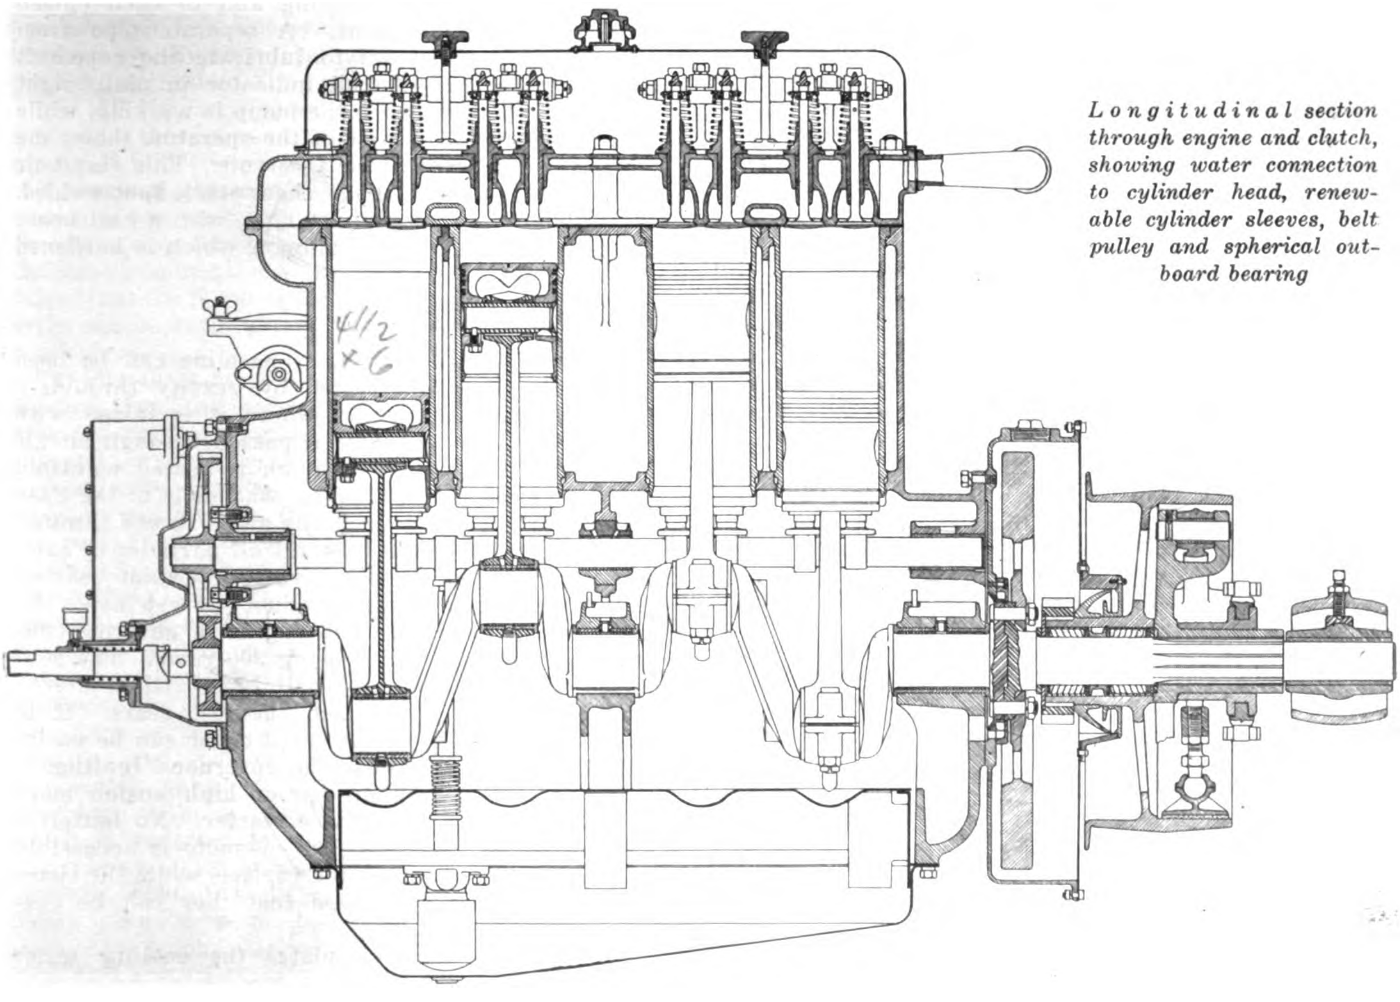


The one-piece main frame

the pull under the rear axle, and the load pulled has no effect upon the steering of the tractor. The drawbar is made heavy so that it may be able to stand the strain of backing up a load, and it may be left swinging or locked in any position desired.

The 27-hp. engine is a special tractor engine, designed to stand the heavy strain common in tractor work, and, like the engines of the other models, is claimed to be capable of developing more than its rated power. The engine is designed to burn kerosene, and all of its parts are easily accessible. It is of the four-cylinder, vertical type, with a bore of 4½ in. and a stroke of 6 in. In order that the transmission may be entirely through spur gears, and that the belt pulley may be mounted on an extension of the engine crankshaft, the engine is mounted transversely on the frame.

The entire valve mechanism, including the rocker arms, springs, stems and rods, is inclosed in a dustproof case, and lubricated by oil spray from the crankcase. In case the operator should wish to inspect the parts, it is an easy matter to remove the cover over the mechanism. The cylinder block is made with removable barrels or liners, which in case of wear or accident can be easily replaced with new ones. This feature is considered to be a most important one in a tractor engine. The sleeves are made of close-grained iron and their bores are ground to a smooth finish. The cylinder head is a separate casting and affords ready access to the valve and cylinders. All parts which require effective cooling, such as the spark-plug bosses, valve seats and valve-stem guides, are surrounded by water. The top of the cylinder head is inclosed with a stamped steel cover. This cover is provided with a felt gasket where it rests on the cylinder head. On top of this cover is placed a breather valve which allows the motor crankcase to vent past the operating parts of the valve gear, so as to keep them well lubricated. This breather valve is so constructed that it is closed when



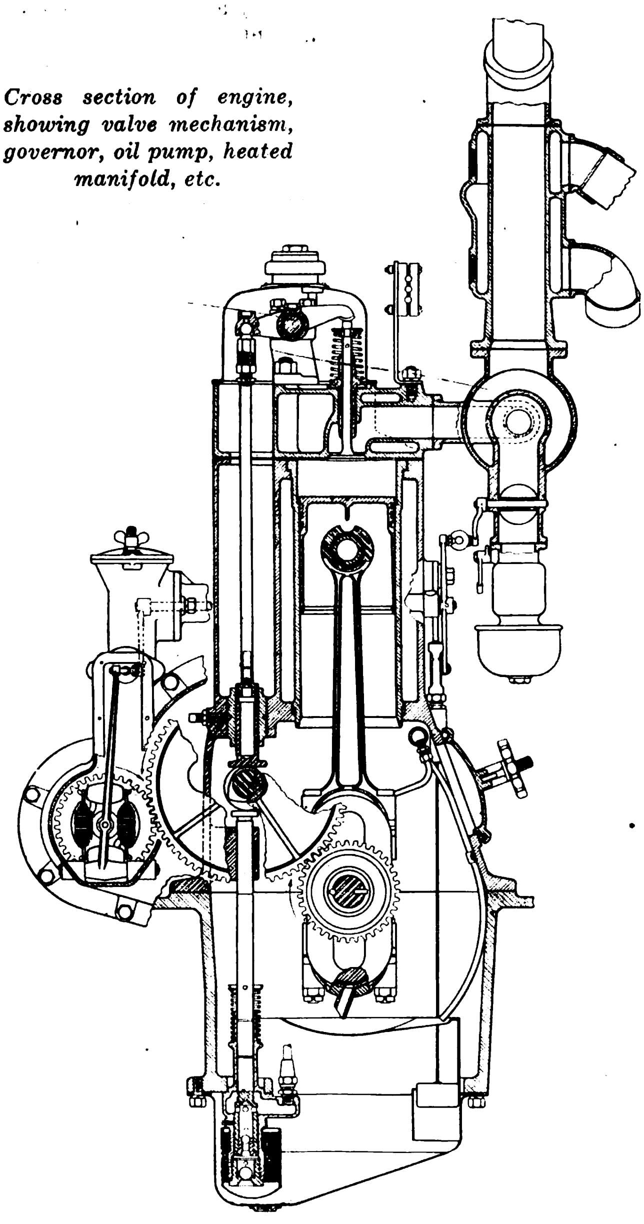
Longitudinal section through engine and clutch, showing water connection to cylinder head, renewable cylinder sleeves, belt pulley and spherical outboard bearing

subjected to any pressure from the outside, but opens to allow the pressure to escape from the inside of the crankcase.

As already pointed out, the lower half of the crankcase is a part of the main frame. This gives the engine a solid bed on the frame and makes it impossible for it to get out of alignment with the other parts of the tractor. The crankshaft main bearings are carried by the main frame castings, with bearing caps on top. There are two large hand holes in the upper half of the crankcase through which the caps of the main bearings can be easily removed, or adjustment to the bearings be made. There are three main bearings, which are of the bronze-back, babbitt-lined type, and their total length is 12⅛ in.

Adjustment of the crankpin or main bearings can be made after the removal of the oil pan. The design is such that the piston with its rod can be removed past the crankshaft, and these parts, of course, can also be taken out through the upper end of the cylinder when the cylinder head is removed.

The crankshaft is a steel drop forging, heat treated. Its bearings are accurately ground to size, and are of the substantial dimensions demanded in tractor work. All main and crankpin bearings are 2½ in. in diameter.



Cross section of engine, showing valve mechanism, governor, oil pump, heated manifold, etc.

Of the main bearings the two outer ones are each 4½ in. long and the central one is 3⅛ in., while the crankpin bearings are 2¾ in. long. The connecting-rods are drop forgings of I-beam section, heat treated. The upper end is provided with a solid bronze bushing, in which the piston pin is carried. The latter has a diameter of 1⅜ in. and its bearing length is 2¾ in. The bushing in the upper end of the connecting-rod is made of Non-Gran bronze.

The pistons are made of the same grade of cast iron as the cylinders, and cut with grooves for three piston rings at the upper end, and with oil grooves at the lower end.

Throughout the entire design care has been taken to see that such parts as require adjustment can be readily reached and parts that are subjected to wear, such as valve-stem guides, push-rod guides and camshaft bearings, are provided with bushings which are easily replaced at little expense. Care has also been taken to see that the engine parts can be taken out and replaced readily.

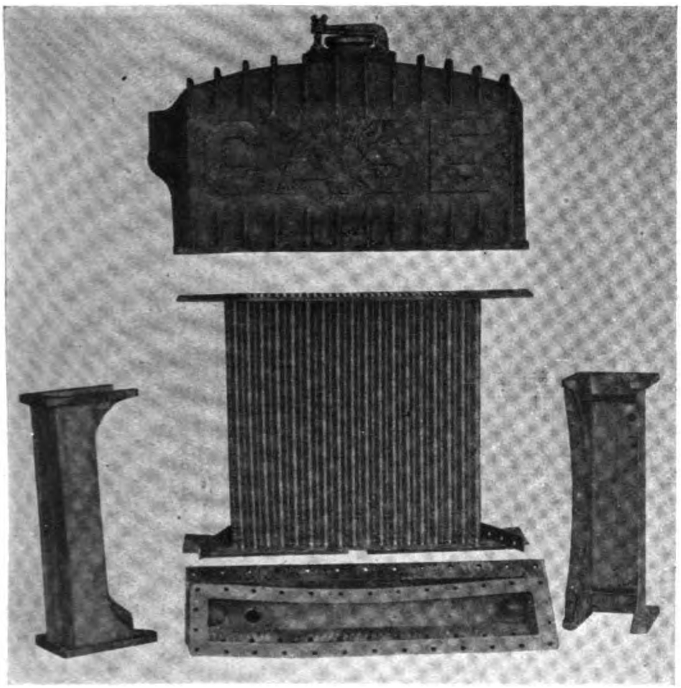
Combination Lubricating System

The engine is lubricated by a combination force feed and splash system. Pistons, connecting-rods, bearings, and valve rocker arms are lubricated by splash, while the crankshaft bearings, camshaft and governor are oiled by force feed from a pump. This pump is of the plunger type and located at the lowest point of the oil pan. The suction side of the pump is provided with a large screen and the whole pump assembly can be easily taken out for inspection. This pump delivers oil to a manifold which is located inside of the crankcase and from this manifold separate pipes carry oil to each main bearing and to each splash trough under the crankpins. A separate pipe from this manifold supplies oil to lubricate the camshaft gears and governor. An oil indicator in plain sight of the operator shows when the pump is working, while a float, also directly in view of the operator, shows the height of the oil level in the reservoir. This reservoir is made of No. 16 U. S. gage sheet steel, spot welded. The oil pump is of the plunger type, with a cast brass body and a cold-rolled steel plunger which is hardened and ground.

Fuel System Details

Either kerosene, distillate, or gasoline can be used as the fuel. The fuel is fed by gravity through a 1⅜-in. Kingston carbureter, where it is mixed with air which has previously been passed through an air washer, and then passes through a heated manifold to the engine cylinders. The air washer is of the Case company's own design. In it the air is forced through water and screens which take out all particles of sand and dirt. This feature has a very important bearing on the life of the engine, as no dust can get inside the cylinders, it is claimed. The engine is governor-controlled, the governed speed being 900 r.p.m. The governor is of the centrifugal ball type, and is driven from the camshaft by helical, cut-steel gears. It is inclosed and runs in oil. A small cover can be easily removed and gives access to the governor. Ignition is effected by means of a dust-proof high-tension magneto equipped with an impulse starter. No batteries are required for starting. The magneto is accessibly located and easy to remove and replace, while the timer and distributor are so located that they can be conveniently examined.

A centrifugal pump circulates the cooling water



Parts of the Case radiator

through the cylinder jackets and radiators. The latter is of the tube and fin type, with cast-iron frame. A gear-driven fan is mounted behind the radiator, and is provided with a friction safety hub, designed to relieve the fan of undue strain when the engine accelerates very quickly. The fan shaft runs on New Departure ball bearings. The cooling water is kept at the proper temperature for successfully burning kerosene by means of a Sylphon thermostat which is inserted in the cooling system.

One of the accompanying drawings illustrates particularly the accessories drive. It will be seen that ball bearings are used for mounting the shaft driving the pump, fan and magneto. Oldham couplings are so placed that the pump or fan drive can be removed as a single unit.

The clutch is of the expanding type. Its spider is provided with a splined hub, and the shoes are faced with asbestos friction fabric. As will be seen from the right-hand view of the tractor, the clutch is very conveniently located for adjustment. It is inside the belt pulley and is operated by means of a lever from the operator's seat. A single clutch serves for both traction and belt work. The clutch pulley is also provided with a brake which is operated by the clutch lever. This brake is used to hold the pulley from spinning when the gears are being changed, and when the gears are in mesh it can be used as a brake for the tractor.

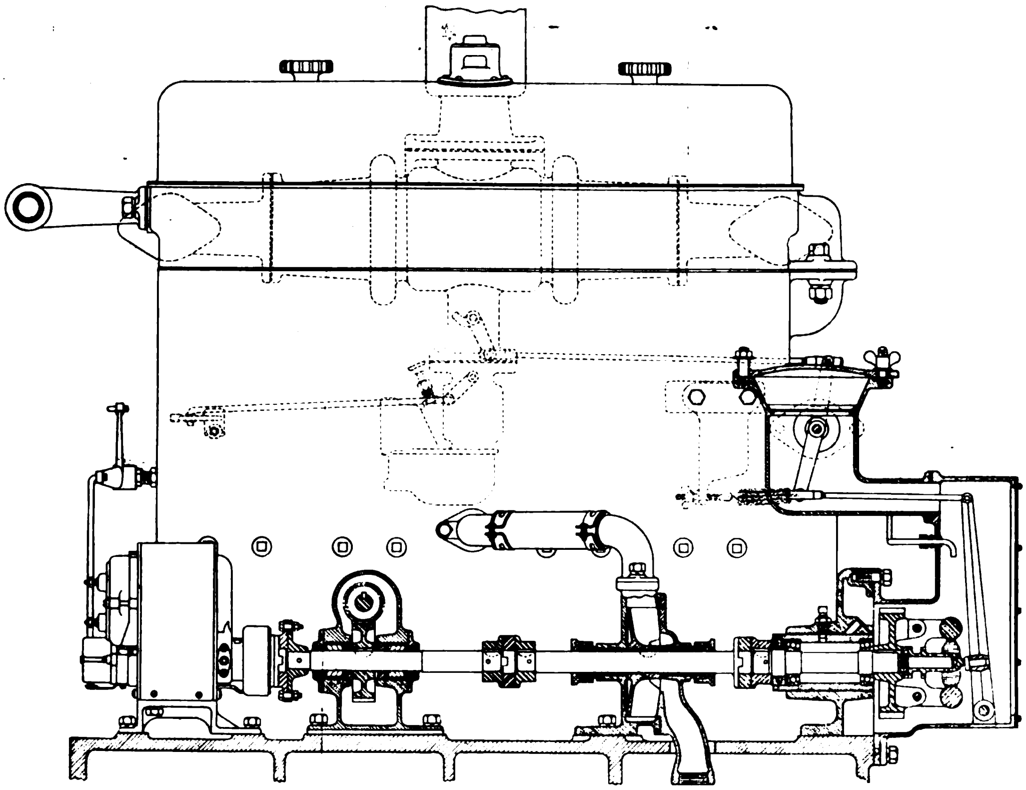
Location of the belt pulley is ideal for belt work, the pulley being mounted on an extension of the crank. The belt pulley is supported not only by the engine main bearing, but also by an outboard bearing. This construction takes considerable load away from the main engine bearing when the tractor is used either in the belt or in the transmission. It should be noted that the clutch arm is fastened to the shaft by means of splines and that the belt pulley is mounted on Hyatt roller bearings.

Design of Transmission

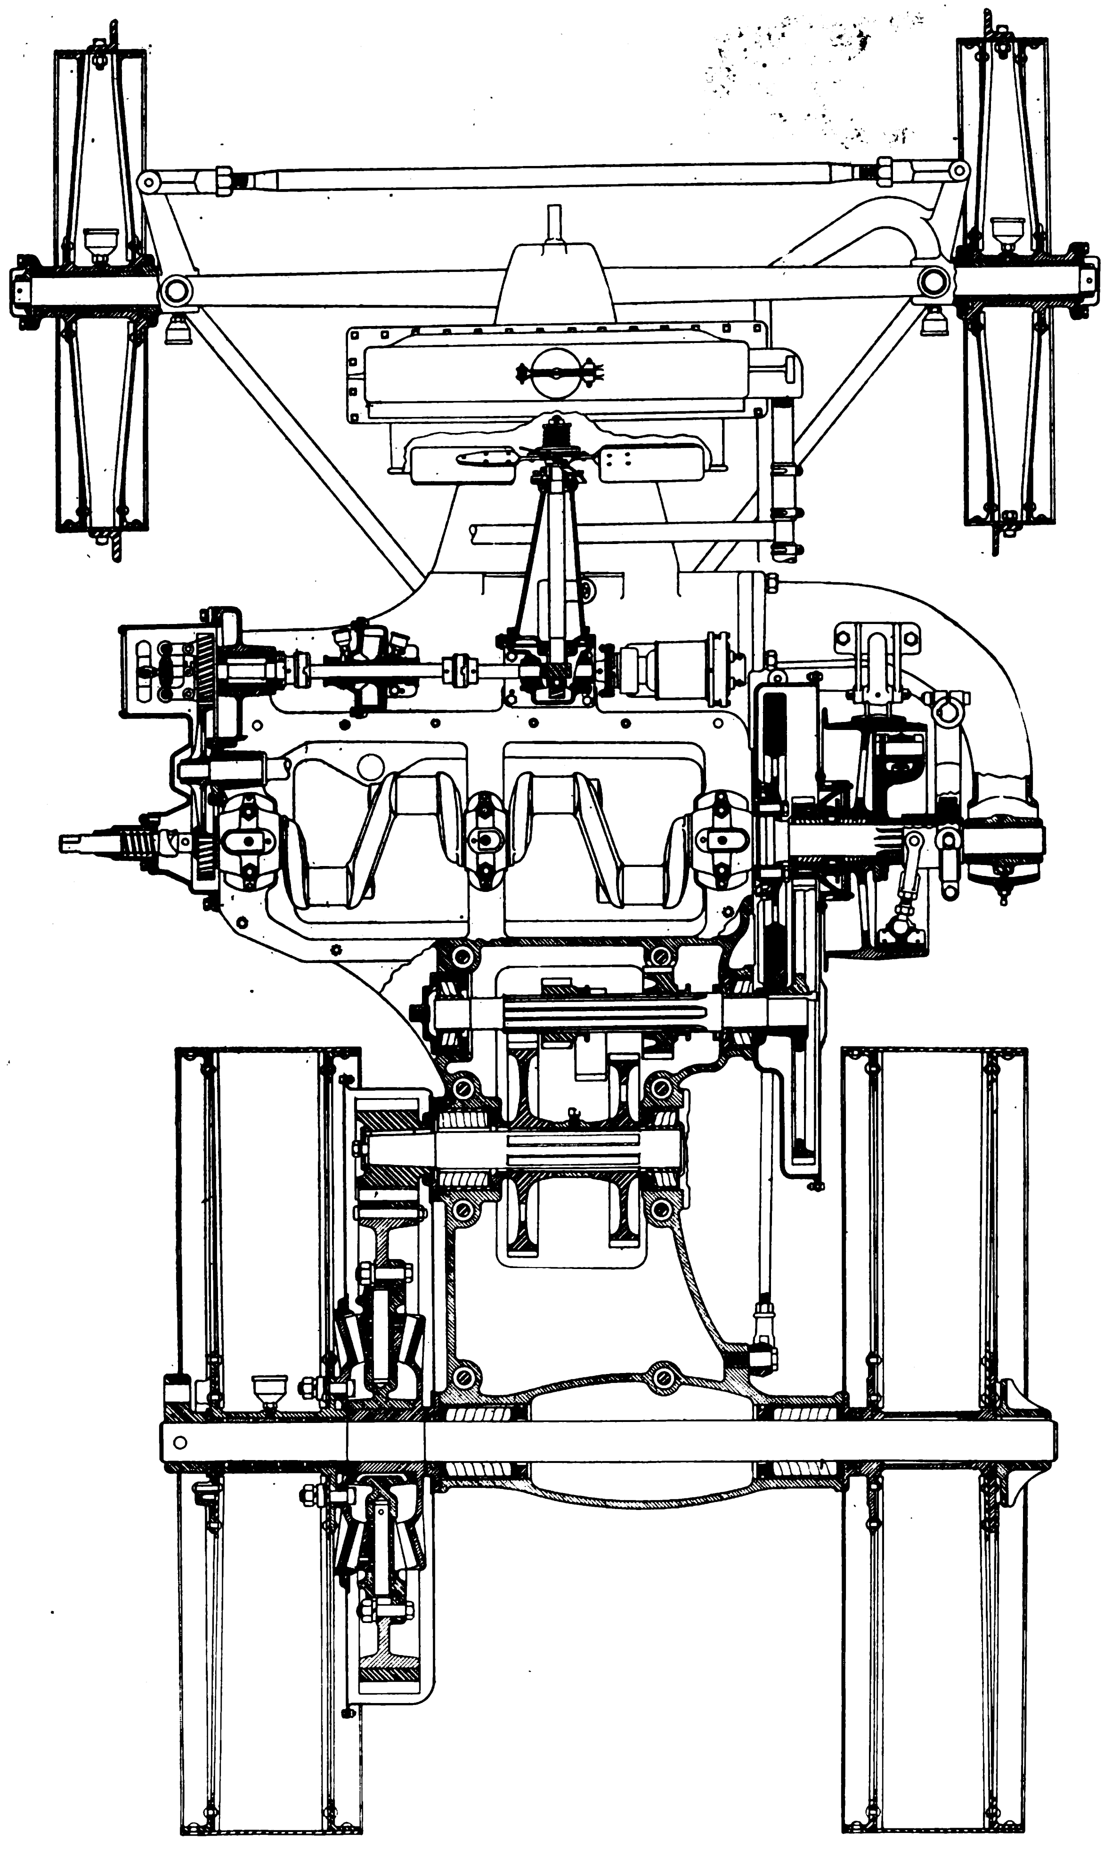
Only cut-steel spur gears are used in the transmission of the Case tractor, and these are inclosed in a dust-proof case and run in oil. The bearings are contained in the frame castings, making it impossible for them to get out of alignment. By removing the cover all of the transmission gears can be easily reached. The gear ratio from the engine to the bull wheel is 62 to 1 for the low gear and 40 to 1 for the high gear.

The crankshaft pinion is made of a steel forging and meshes with a semi-steel first reduction gear, keyed to the first shaft in the transmission. This shaft runs in Hyatt roller bearings and is provided with six splines through which the two-speed changing gears are driven. These sliding gears are drop forged, cut and hardened, and they provide two forward speeds, 2½ m.p.h. for plowing and 3½ m.p.h. for road work and for some of the lighter work in the field.

The low and high-speed gears are both made from drop forgings, are cut and hardened. The shaft which carries these gears also carries the bull pinion, and runs in Hyatt roller bearings. The bull pinion and master gear are steel forgings. Both of these have cut teeth, and run in oil in a dust-proof case. The differential bevel gears and bull pinions are made from cast steel, and they are inclosed to protect them from dust



Accessories, drive shaft, magneto, pump and governor



Plan view of Case 17-25 tractor, showing layout of transmission and drive

and provide for easy lubrication. The differential is carried on the rear axle and runs in Hyatt roller bearings.

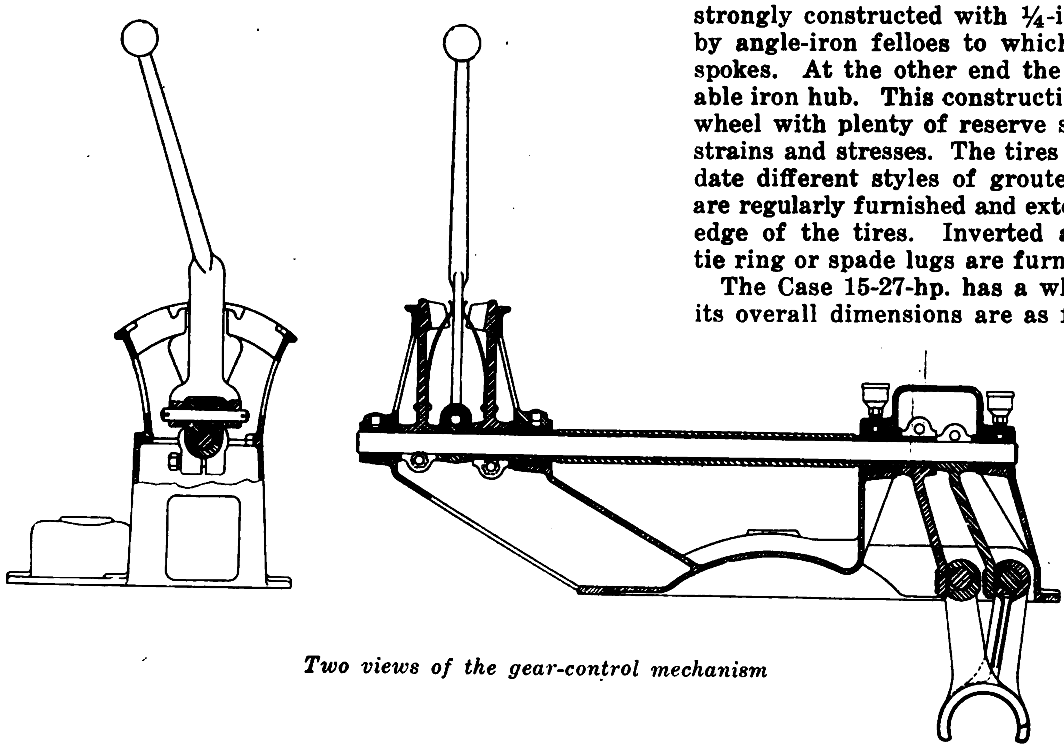
The transmission case is made of cast steel of deep section and is secured to the under side of the main frame by bolts of such length that they extend through the main frame and this case. These bolts are located at each side of the first and second reduction shafts and add strength to the main frame.

The transmission case performs the function of an oil pan for the transmission. The babbitted portion of this case is for the support of the reverse pinion shaft. This shaft is flattened on both ends, the flattened ends coming against the main frames, which prevents the shaft from turning and makes an easy assembling proposition as well as for the easy removal of the reverse gear and its shaft.

The belt pulley, which is 16 in. in diameter and has a 6½-in. face, is mounted on an extension of the engine shaft, and therefore runs at engine speed—900 r.p.m. The pulley being located on the same side as the tractor steering wheel makes it easy for the operator to line the machine up with the machine to be operated.

Power is transmitted to both rear wheels, which are 52 in. in diameter and have a 12-in. face. They are strongly constructed with ¼-in. plate tires, reinforced by angle-iron felloes to which are riveted twelve flat spokes. At the other end the spokes rivet to a malleable iron hub. This construction makes a solid, durable wheel with plenty of reserve strength to stand sudden strains and stresses. The tires are punched to accommodate different styles of grouters. Angle-iron grouters are regularly furnished and extend 6 in. beyond the outer edge of the tires. Inverted angle-iron grouters with tie ring or spade lugs are furnished on special order.

The Case 15-27-hp. has a wheelbase of 76½ in., and its overall dimensions are as follows: Length, 126 in.; width, 72 in.; height (without exhaust pipe), 68 in. The shipping weight is 5500 lb. The tractor pulls three 14-in. plows in tough sod or four plows under usual conditions. It is also adapted for other drawbar work requiring a similar amount of power, and it will operate either a 20 x 36 or 26 x 46-in. thresher.



Two views of the gear-control mechanism

Development of Military Aircraft in Great Britain

THE earliest type of British reconnaissance machine was the B.E.2 C., designed and produced by the Royal Aircraft Factory at Farnborough. The design was completed just prior to the outbreak of war, a fact which facilitated immediate production for the use of the Expeditionary Force. As far as possible, speed, climb and maneuvering ability were combined, although, compared with modern types, it was a relatively slow machine, making only 50 miles to 60 miles an hour with the 80-hp. engine with which it was originally fitted. This was followed by the Armstrong-Whitworth F.K. 8, fitted with 160-hp. Beardmore engines, which made an average speed of 82 miles an hour and could climb to 10,000 ft. in about 27 minutes. Toward the end of 1916, a forward stride was taken by the production at the Royal Aircraft factory of the R.E. 8 with a 12-cylinder R.A.F. engine. This machine has done the bulk of the artillery observation work in France, directing all the big-gun fire and barrage work. At 10,000 ft. it has a speed of 92 miles an hour, and can climb to that height in 11 minutes. It is fitted with camera and wireless equipment, and takes photographs of every "shoot." A bigger advantage was marked by the introduction of the "Bristol Fighter," a long-distance fighting reconnaissance machine, capable of traveling at 113 miles an hour at 10,000 ft. and climbing to that height in 11 minutes. Had the war continued, the Bristol Fighter would have entirely replaced the R.E. 8 for long-distance artillery work.

Aerial bombing was first undertaken in France by the Avro, a machine of moderate speed fitted with an 80-hp. Gnome engine. The observer's seat was used as a receptacle for the bombs, which were merely thrown overboard without the aid of the scientific bombing sights and elaborate bomb-dropping gear which have since made possible more accurate work. The first British machine specifically constructed for bombing purposes was the Short, a modified sea-plane, fitted with a 250-hp. engine and carrying four 112-lb. bombs under each wing. This type, which did most useful work in France, was followed by the Sopwith 1½ strutter, and later by the improved D.H. 4 and D.H. 9 machines. The D.H. 4 machine was originally destined as a fighter, but its trials disclosed such excellent lifting powers that it was converted to bombing purposes. It is capable of climbing to 10,000 ft. in 9 minutes, and has an endurance of 3¾ hours. The D.H. 4 and D.H. 8 machines have been fitted with Rolls-Royce, B.H.P., and latterly the Liberty engines.

Finally, the large Handley-Page machines were devised for the bombing of Germany. The first quantity production was begun in August, 1917, and the performance of the machine has justified its expectations. It is capable of carrying 2000 lb. weight of bombs in the fuselage, or 1500 lb. to suspend externally. The machines used by the R.A.F. Independent Force in the bombing of Germany have been the Handley-Page, D.H. 4, D.H. 9, and Sopwith "Camel." Not until the middle of 1915 were production machines armed with standard equipment. Two of the earliest types were the F.E. 2 B and the Vickers "Fighter." Both had an open cockpit, and were equipped with Lewis or Vickers machine guns. The year 1916 witnessed the introduction of the fixed machine gun firing through the propeller and fitted with the ingenious Constantinesco interrupter gear. Other types followed rapidly, leading up to the S.E. 5A, and lastly the Sopwith "Dolphin," the best and latest British fighting scout in the field.

Trend of German Airplane Design

A Summary of Features of Captured Enemy Machines, Issued by Technical Department (Aircraft Production), British Ministry of Munitions

ENEMY aeroplanes which have been captured intact or reconstructed have, under test, generally shown themselves poor in performance, judged by British standards, especially in point of speed at heights; but it would seem that as a rule they are fairly good in point of climb, and notably good in regard to maneuverability. Pilots report them, in the main, comfortable to fly and easy to land, especially the more modern types.

Wing Section

Scale drawings showing the wing sections employed are included in the detailed reports on the various enemy aeroplanes. In general they do not differ very markedly from British wing sections, though there is a distinct tendency toward rather greater camber. It is thought probable that this principle has been adopted so as to yield better results at high altitudes when the angle of incidence would necessarily be somewhat big.

Practically all German aeroplanes have a pronounced wash-out at the tip of the trailing edge. In the most recent example of Halberstadt design, namely, the C4 type, the lower wings are given a heavy wash-out at their junction with the bottom of the fuselage, the idea being to minimize the surface of discontinuity which would otherwise exist between the bottom surface of the fuselage and the wing roots. Thus the front spar is straight, but the rear edge is markedly concave. This effect exists to such an extent that the trailing spar is considerably bent as well as twisted.

The Fokker wing section is in a class by itself, not only on account of its great depth, but also in having only a very slight camber on the bottom surface. The performance of this machine is, however, by no means despicable, and it is generally conceded to be a redoubtable opponent in spite of the departure from optimum wing section which has been made.

Bays

As far as single and two-seater machines are concerned, the usual wing construction involves a single pair of struts at each side, but it is noticeable that in the latest model Pfalz scout, the D12, this practice has given place to double pairs of struts. Indications point to great strength having been made a matter of prime importance in this design.

In some types, notably the Pfalz and the Fokker, the upper plane is made as a single unit. In the latter case, the lower plane is also in one piece. In the generality of machines, however, the center section principle appears to be gaining vogue. Thus, whereas the L. V. G. C5 has a cabane consisting of the usual pyramid of struts, its successor, the C6, is furnished with a center section embracing a gravity petrol tank and the radiator, both of which are let into the plane flush with its top and bottom surfaces. The Halberstadt and Hannoveraner designs employ the same scheme.

Spars

Shortage of ash and spruce has led to the general adoption of built-up spars, which are of such a variety of types that a separate report is being issued upon their design. In nearly all cases ply-wood plays an important part. Thus in the Fokker biplane the spar, which, owing to the absence of the usual wire bracing of the wings, is extremely deep, consists of two thin rails of spruce united by deep ply-wood webs. In the Gotha bomber a built-up I-section spruce spar is covered in with ply-wood at each side. On the Giant four and five-engined bombers the spars are of hollow rectangular section, strengthened by a transverse web across the middle of the box. The latter is built of numerous components tongued and grooved together. The whole is strengthened by walls of multi-ply glued on each side. In the Halberstadt's design the built-up spruce spars are reinforced by broad horizontal webs of ply-wood running longitudinally, and at each edge of these are stringers. The whole spar construction thus represents a section similar to an H lying on its side, of which the central box spar forms the cross bar.

The A. E. G. machines are alone in employing steel tubular spars.

Other German designs, such as the Pfalz, D. F. W., L. V. G., Rumpler, and Albatross, employ built-up spars of the ordinary accepted type, either of box or I section.

Wiring

With the exception of the Fokker biplane and triplane, which have no external wire bracing whatever in the wings, the rigging of German machines is upon the accepted lines. The standard material is multi-strand cable furnished with whipped and sweated splices at the loops. Quick detachment devices, which at one time were fitted on several German models, have now disappeared. For internal wiring, both plain wire and stranded cable are used. In the Fokker design, the angle of the drag bracing cables between the struts seems to be very bad, but according to reports this machine is actually unusually strong. Drag bracings are in some cases taken from the front of the fuselage, but in most designs are confined to the interior of the wings. In no case is the undercarriage used to form a component of the bracing system.

In most machines the compression struts between the spars, for drag bracing, are steel tubes, but in some cases, notably the Fokker, Halberstadt and Albatross, wooden box ribs are used for this purpose.

Fuselages

The standard type of German fuselage construction embodies a three-ply shell built up on light wooden formers. It is generally of the wireless form, but in some cases the forward portion in the neighborhood of the wings and engine is strengthened with diagonal bracing. This is adopted also in the Gotha in that part of the body which embraces the cockpits and petrol tanks.

Exceptions from this general rule are the A. E. G. two-seater, the A. E. G. bomber, and the Fokker (biplane and triplane). In all of these steel is exclusively used for the fuselage construction, the transverse members being welded to the longerons. In the four and five-engined Giant bombers the rear portion of the fuselage, including the longerons, is of steel tube, while in the

Friedrichshafen bomber wooden longerons are used in conjunction with steel tube compression members.

In nearly all cases the wooden fuselage is roughly rectangular in section, with corners rounded off, and tapers to a vertical knife-edge at the rear. In the Halberstadt, on the contrary, it tapers, in a manner similar to that of the Bristol fighter, to a horizontal edge. In the Pfalz designs great pains have been taken to produce a fish-shaped body of perfect stream-line form; this is of approximately elliptical section throughout, though leaning toward a sharp "backbone" near the tail. The performance of this design is, however, relatively poor, and the rather elaborate streamlining appears to bring no great material benefits.

In the Albatross and the earlier Pfalz the fin is built in one with the fuselage, and very neatly faired off; but it is notable that in the latest Pfalz this practice has been discarded in favor of a detachable fin.

Tail Surfaces

The use of fixed fins and tail planes is now standard on all German aeroplanes, and in nearly all cases both the rudder and elevator are balanced. In some cases—notably the Fokker biplane—the fin is offset so as to mitigate the turning effect due to the swirl of the slipstream. In the Hannoveraner fighter a biplane tail is incorporated with a view to reducing the blind area of the movable machine gun.

In all the big bombers—the Gotha, the Friedrichshafen, and the Giant machines of both types—a biplane tail is now a standard fitting, though it has not yet been adopted on the A. E. G.

In practically all cases the framework of the tail organs is of light steel tube, and in general this applies to the fixed planes as well as to the controllable surfaces. In the Pfalz, Albatross and L. V. G. designs the fixed plane frames are of wood and covered with thin plywood.

In some cases—notably the A. E. G. bomber—the fixed planes are of heavily cambered streamline section. The same practice, though to a less noticeable extent, is embodied in the latest Halberstadt; but in the Fokker, which is to be regarded as one of the most up-to-date German types, flat uncambered surfaces are exclusively employed. In this case, too, the fixed tail plane is made in one unit and dropped into brackets on the top side of the fuselage, instead of being constructed in two halves, and placed one on either side. This principle has also been adopted in the most recent Halberstadt.

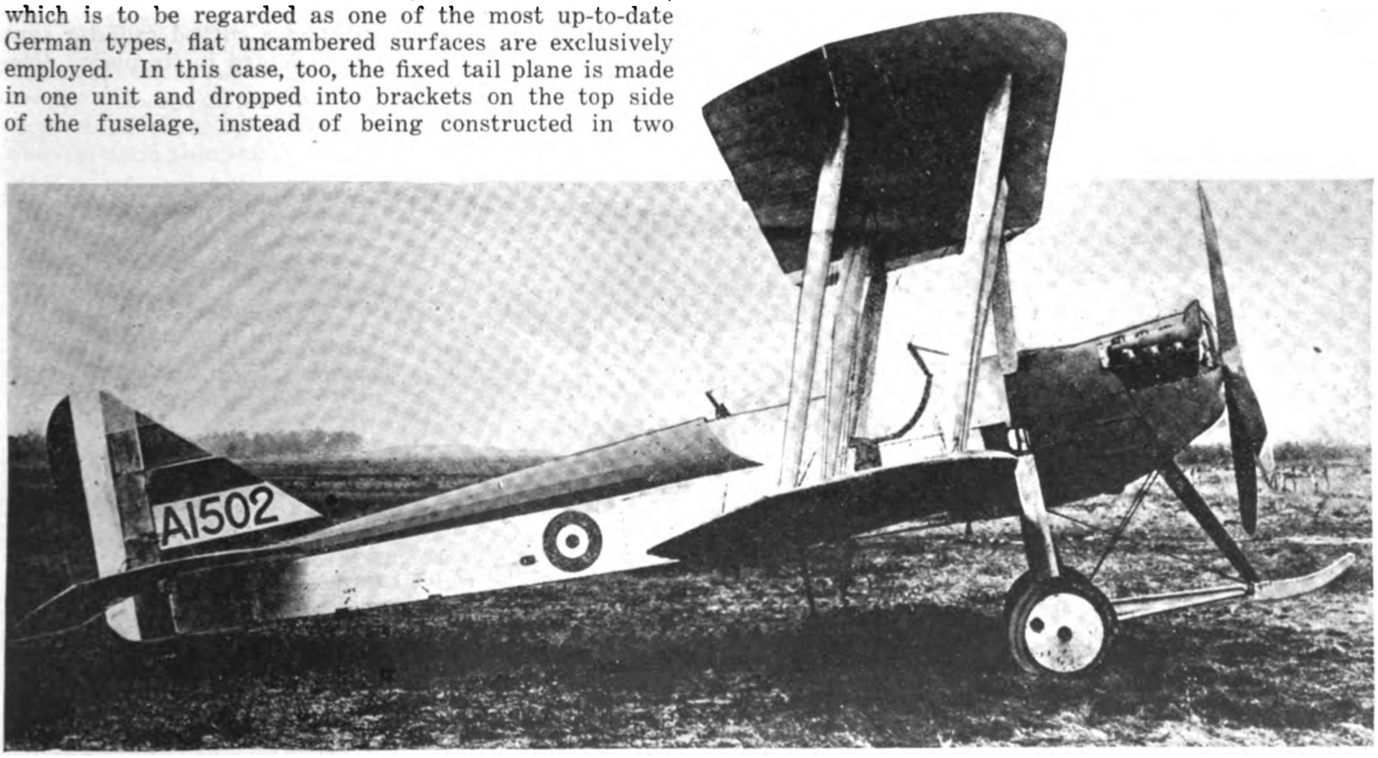
The control gear on German aeroplanes calls for very little comment, being, in all but the large bombers, of the standard universally jointed stick pattern. The arrangement of the rocking shaft varies, being, in some cases, fore and aft, and in others transverse. The rudder bars are almost invariably made of welded sheet steel, and are generally fitted with toe straps. In recent machines the pilot's seat is frequently adjustable, whereas in earlier designs it was more common to find the leg reach adjustable on the rudder bar. In several cases a locking device is employed, so that the elevator can be fixed at any angle. In the Fokker biplane the control gear is extremely light compared with that of other enemy designs.

Wheel control for the ailerons is only used on the large bombers, such as A. E. G., Gotha and Friedrichshafen. In the first-named, a dual control for the elevator and rudder is provided, but in the others no form of dual control at all is found. In the giant aeroplanes double control, operated by two pilots simultaneously, is adopted, as the physical effort called for is beyond the capacity of a single man.

Struts

Probably owing to a shortage of timber, wooden interplane struts are very little used, and are only found in the Friedrichshafen, L. V. G., and the older type of Pfalz. Steel struts are either tubes of round section faired off with a three-ply or solid wood streamlining, or of oval section, the latter practice being increasingly popular. In some cases the strut ends are tapered and welded to a socket; in others the tube is kept full section, and is dropped over an eyebolt at each end. N struts for the junction of the top plane and the fuselage are common, and are also used between the planes in the Pfalz and Fokker models. Oval steel tubes for undercarriage struts are practically universal, the L. V. G. being the only design incorporating wooden members in this position.

In general, there are two types of fabric found on



Armstrong-Whitworth with 90-hp. R. A. F. engine. Note front skid

enemy aeroplanes. They are of similar material, but differ in coloring. That intended for scouts and fighters is camouflaged in the familiar pattern of irregular polygons of light colors, while that for bombers is of such dark tones that the shapes of the polygons can scarcely be discerned. In some examples of the Fokker biplane the upper surface of the wings is painted a bright color, such as red, over the top of the dyed camouflage scheme. The Pfalz was formerly covered with an aluminum dope; but this has now given way to the standard coloring.

The quality of fabric is, in general, good, but in most cases the dope seems to be carelessly applied, and not thoroughly "worked in" to the material, from which it readily peels off.

Body Coloring

The bodies of aeroplanes are sometimes left in natural wood colors, as in the L. V. G.; sometimes, as in the Fokker, painted in two bands of bright colors; but more often covered with a cloudy camouflage effect, consisting of soft, low-toned colors, gradually fading into one another and apparently sprayed on.

It would appear that in recent designs the necessity of giving the pilot a good view has received more consideration than in the past. The Fokker, Hannoveraner and Halberstadt machines are excellent in this respect. The bombers seem also to be good, with the exception of the A. E. G., which is very awkward indeed.

Undercarriage

For scouts and two-seaters the plain axle slung to V struts is invariably adopted. In most cases neither the axle nor the tie rod is faired off, but in the Fokker types, both monoplane and triplane, the axle fairing has been developed into a lifting surface. In the larger bombing machines current practice varies considerably. Thus in the Friedrichshafen there are three two-wheeled axles —one under each engine and the third under the nose of the fuselage. This system has been adopted in some of the giant aeroplanes. In the Gotha there are two two-wheeled axles under each engine, while in the four-engined giant under each engine unit is a ponderous single axle supporting at each end four wheels placed side by side.

Rubber bands have now entirely disappeared, and their place has been taken by steel coil springs. In some cases three coils, of alternate "hand," are placed one inside the other; in others, three small coils are grouped together in a "clover leaf" and covered in with cotton fabric. The weight of spring used on the average machine is about 5 lb. for each wheel. In the Gotha the shock-absorber springs are concealed in the undercarriage struts, and are worked by a cable passing over pulleys. Steel-shod wooden tail skids are almost always used, but are not made steerable.

Engine Bearers

In most scouts and two-seaters wooden bearers, sometimes of ash, but more often of pine, are supported on multi-plywood bulkheads, but in the Fokker and A. E. G. designs the construction is of steel tubes, to which flat clips are fixed for the support of the crankcase arms. In the A. E. G. bomber the bearers are hollow steel of rectangular section. Owing to shortage of suitable timber, the bearers on the giant aeroplanes, which are necessarily very long, are built up of a soft wood center piece, reinforced top and bottom with five half-inch layers of ash.

Engine Controls

On a few machines—notably on the Hannoveraner—this is fitted in duplicate, there being, in addition to the usual throttle lever, another controlled by Bowden wire from the control stick. In the multiple-engined bombers separate engine throttle levers for each engine are installed, and in the two-engine type they are so placed as to be operated together when required. The same applies to ignition advance levers, but where Mercedes engines are used the ignition control is coupled up to the throttle.

Radiators

Several types of radiators are in use on German aeroplanes, and in nearly all cases they are fitted with some simple form of shutter, which is used in conjunction with an electrical rheostat thermometer. Formerly it was the general practice, especially in two-seaters of the D. F. W., Rumpler, A. E. G. and L. V. G. patterns, to mount a rectangular radiator in front of the cabane, just underneath the top plane; but in the latest L. V. G.'s this method has been discarded, and a curved radiator sunk flush in the center section is adopted in its place. Gen-

Armstrong-Whitworth plane with 160-hp. Beardmore engine

The twin engined FE-4 of the British Royal Aircraft Factory

erally speaking, this plane radiator is now standard in two-seater designs, but in the Pfalz, which previously incorporated this scheme, the latest pattern has a nose radiator of vertical tubes, the arrangement being somewhat similar to that of the Fokker biplane; these two machines are in this respect in a class by themselves.

On bombers the usual design embraces a car type radiator at the front end of the engine bearers, but in the four and five-engine giant machines the use of gear boxes has prevented this practice being adhered to, and in these the radiators are carried well up above the motors, and fixed either on the engine bearer struts or on wires.

In the flush pattern of radiator the tubes are horizontal and of flattened oval section, and are set with their major axis inclined. The tubes are in two cells, which are separated by baffle plates, which insure that the water runs from side to side, then down, and then from side to side back again. A short-circuit tube is nearly always provided to guard against the formation of air locks in the upper portion of the water tank. Another fitting frequently met with is a small subsidiary water tank mounted above the radiator and connected to the main filler cap with a tube. The top of this tank is fitted with a trumpet-shaped nozzle pointing forward.

Gears

It is significant that in the four and five-engined giant aeroplanes massive gear boxes are used in conjunction with standard engines of the Mercedes and Maybach types. As might be expected with six-cylinder motors, the gear boxes are very heavy. In the four-engine machines they had shallow casings fitted with cast aluminum cooling fins, and were connected to the engines by flexible couplings and external shafts. In the five-engine design the shafts are inclosed within the gear box. Plain spur pinions are fitted and the ratio employed both for tractor and pusher screws is 21/41. The gear boxes are of two distinct types—a short one for the tractor screw and a long one for the pusher. The latter is given considerable overhang in order to obviate the need for cutting away a section of the trailing edge to give clearance for the screw. This idea had been adopted both on the Friedrichshafen and Gotha designs, doubtless with some noticeable loss in efficiency.

Each gear box, including the flywheel on the engine which it necessitates, the flexible coupling, and the oil radiator, adds a weight of 346 lb.—a little over 1.15 lb. per horsepower. It is obvious, however, that the gain in propulsive efficiency is considerable.

The oil radiator referred to consists of a semicircular tank slung under the gear box, and containing 65 tubes of, roughly, 20 mm. diameter. Oil is circulated through this and the sump in the gear box by a pinion pump driven through worm gears and a flexible shaft from the driving pinion shaft of the gear box.

Fuel Systems

These generally incorporate two tanks—one gravity and one under pressure supplied by an engine pump—except where Benz engines are installed. In this case a fuel pump is employed, which supplies a tubular chamber, from which the overflow returns to the main tank; a hand fuel pump of the semi-rotary type is used for filling the gravity starting tank. The last named is frequently let flush into the center section of the upper plane, or is strapped on to it, except in the D. F. W. and Pfalz designs. In the former it is placed on the top of the main tank, and forms the back of the pilot's seat; in the latter it is under the engine cowling. In the Fokker, the main, auxiliary and oil tanks are incorporated in one unit, and a hand pressure pump is fitted for starting purposes. A small windmill, similar to that on the D.H.9 aeroplane, was found in the wreckage of the five-engined giant, and it is conjectured that the enemy may have turned his attention to this kind of fuel supply mechanism.

Owing to the shortage of the best classes of timber, mahogany and walnut are now frequently replaced by ash, pine, sycamore and maple. The screws of the giant bombers, being geared down, roughly, to 2 to 1, are not very heavily stressed, and are made entirely of soft wood covered with thin veneer, the grain of which runs across the blade.

The majority of German aeroplanes are internally wired for greater wireless capacity, but are only fitted with transmitting apparatus when this is actually going to be used. In some cases the dynamo is driven from a pulley on the engine in conjunction with a hand-controlled clutch, but in modern types it is commoner to find the dynamo supported on one of the undercarriage struts, and driven by a screw in the slip-stream of the tractor. On the five-engined giant a Douglas type horizontally opposed engine of about 3 hp. drives the wireless and heating generator.

Women Can Handle Exacting Work

Work Better in Groups—Temporary Lull in Demand for Women Likely

By J. Edward Schipper

ONE of the great lessons of the war in American manufacture has been the ability of women to handle exacting jobs. Considerable interest has been exhibited in the question of what is to be done with the women employees when the soldier comes back to claim his job. It presents a problem which is being solved differently in different plants.

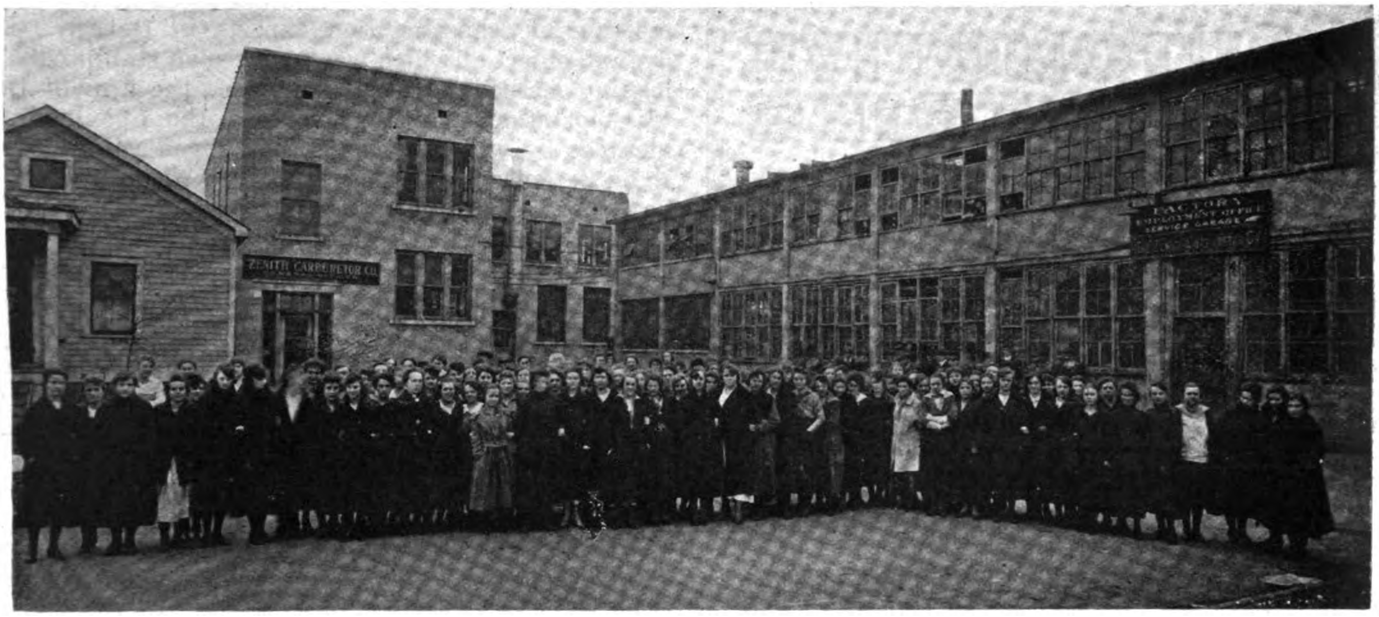
A large number of concerns have terminated the war work upon which the women were engaged and have laid off the women as well as the men who were doing the work before swinging back into normal manufacture. Nevertheless, the lesson has been learned that women can do this sort of work and do it as well as or better than men. There may be a temporary lull in which the excess of labor will compel factories to engage men and returned soldiers in preference to women, but it is quite certain that when the reconstruction period fully hits its stride the temporary surplus of labor will be readily absorbed.

The immense programs laid down by the Government for big engineering works and the policy of expansion determined upon by the largest manufacturers indicate that in about a year the pre-war scale of production will be exceeded. It is inconceivable that we are to go back to pre-war conditions. We have made advances in a great many ways, and the proof of the ability of women to hold their places in the industrial world has been one of these.

Never have any closer inspection systems been laid down than those used in Government airplane practice. Everything is required to be so exact that even minute variations from standard in the exterior finish of an airplane product have been deemed sufficient cause for rejection. At first, many who were used to commercial manufacture along other lines put forth strenuous objections, on the ground that not only was necessary production being delayed, but that costs were being run foolishly high because of the closeness of the work required.

With real adaptability, however, manufacturers soon began to meet requirements, and with a little yielding on the part of the Government along certain lines where

Girls at work in the Holbrook plant of the Cadillac Motor Car Co. welding the cylinders for Liberty airplane engines



Women employees of the Zenith Carburetor Co., which was engaged in the work of making carburetors for the Liberty engine

it was admitted that closeness of inspection was not essential, a happy balance was struck. Nevertheless, the work as a whole was to far closer limits, and held there with greater rigidity than was ever deemed possible in previous commercial manufacture in anything but precision instruments.

Adaptability of Female Labor

What is the most astonishing fact of all is that it was possible in this sort of work to employ female labor where it had never been previously thought of. Some of the illustrations herewith show a large number of girls doing acetylene welding on the water jackets of the Liberty engine cylinders. Cadillac and Packard both employed women for this welding operation, and both were highly satisfied with the results.

Work of this kind, which is departmentized, permitting women to be used in groups, has proved to be far more satisfactory than individual work where both men and women are employed in the same department. Experience has taught that in employing women for any sort of shop work, they are working to their best advantage in groups of five or more, under the control of a foreman or forewoman.

On war work the patriotism and *esprit de corps* of the woman workers was very noticeable. They were imbued with the idea that every job turned out was helping the cause, and this was a great spur to their endeavors.

An example of concentration on the work is very clearly shown in the large illustration herewith, depicting the welders employed on the Liberty cylinders at the Holbrook plant of the Cadillac Motor Car Co. Notwithstanding the time-honored reputation for curiosity, not one of the welders stopped her work or looked up at the camera while the picture was being taken.

Peace Also Will Need Woman Labor

The opportunities for women to be active in industry may decrease somewhat during the next few months, but if they do, it will only be a temporary lull, and as soon as the commercial and governmental manufacturing programs now being laid down are in full swing, every one of the women who found congenial industrial employment during the stress of war will find a job awaiting her in times of peace.

Inflammability of Aluminum Dust

ALUMINUM dust burns quietly when in a pile, but if this pile be disturbed in such a manner as to raise a cloud of the dust into the air the burning takes place with explosive violence. If a dust cloud already formed that has a density within the explosive limits be ignited, a violent explosion results. As several disastrous explosions of this dust have happened in manufacturing establishments, the Bureau of Mines has thought it worth while to investigate the physical and chemical properties of the dust with especial regard to inflammability and to the problem of extinguishing fires and of minimizing the force of explosions once started. The results of this investigation are recorded in Technical Paper 152 of the Bureau of Mines on The Inflammability of Aluminum Dust, by Allan Leighton. Water is worse than useless for extinguishing such fires. One method of subduing fires of aluminum dust is to pour oil onto the fire until it is smothered, and then use carbon tetra chloride to extinguish the fire in the oil.

A job where care and thoroughness are required—spraying the Liberty engine with oil to prevent rusting from dampness, before crating for overseas shipment

Freight Car Loading Methods

DURING the freight car shortage of the past year many new methods of loading cars with automobiles were devised, all tending to make one car hold more automobiles than it had ever held before. As in so many other cases, necessity was the mother of invention. The automobiles had to be delivered, and it was impossible to get a sufficient number of freight cars. The only alternative to shipping by railroad was to deliver the cars by the drive-away plan, which was expensive and involved considerable risks. So the men in charge of the shipping departments began to ponder over the problem and evolved the new methods, some of which have been described and illustrated in these pages.

These new methods not only helped in tiding over the temporary car shortage, but will permit of saving on the transportation of automobiles in the times of peace ahead. Naturally the solution of the problem differed in the different factories, and as a result practice in loading cars has gotten into a chaotic state. The whole subject was discussed at a recent meeting of transportation experts in Detroit, the avowed object of which was to agree on standardized loading methods. It can hardly be the aim of the transportation men to revert to the old loading methods by which no more than three automobiles could be gotten into a car. What will undoubtedly be done is that the various new methods will be thoroughly discussed, their respective strong and weak points compared and a method standardized which will combine as many of the good points of the various plans now in use as possible. If this is accomplished the freight car shortage of 1918 will have yielded a permanent benefit to the automobile industry.

The Hotchkiss Drive

IT was predicted a year and a half ago, when the Government adopted the Hotchkiss drive for its Class B trucks, that if these trucks stood up under the severe condition of operation behind the battle front it would have a far-reaching influence on truck design after the war. A vehicle with Hotchkiss drive is obviously cheaper to manufacture than one having separate torque and thrust members, and as in connection with motor trucks considerations of economy usually predominate, the saving that may thus be effected is likely to prove an important item. Of course, it would not be quite right to say that the expense of making and assembling a pair of radius rods and a torque arm measures the difference in cost of a truck with Hotchkiss drive and one with special torque and thrust members. The problem is not quite as simple as that, for if the springs are only just sufficiently strong for the purpose of carrying the weight, it will not do to burden them with the torque and thrust loads in addition. Not only must the springs be made heavier for the Hotchkiss drive system—assuming, of course, the same flexibility—but special provisions must be made to adapt them to taking thrust loads without injury.

There is one other thing in favor of the Hotchkiss drive besides reduced manufacturing cost, and that is the flexibility which it gives the drive and which tends to protect the entire mechanism from the engine to the driving wheel when the driving power or the traction resistance is suddenly varied through a wide range. A slight amount of flexibility is usually obtained by supporting the forward end of the torque arm between springs, but it is readily seen that if the torque is resisted by the chassis springs the range of angular yield of the axle may be considerably greater.

Against these advantages of the Hotchkiss drive must be set its disadvantages. The springs of a truck with Hotchkiss drive are really combination or multi-purpose devices. They serve, in fact, a triple purpose, and it is logical to assume that if a special part were designed to serve each of these purposes it could be made to do it more satisfactorily or more efficiently. For instance, it is claimed, and apparently with good reason, that with the Hotchkiss drive the springs do not cushion shocks as well

as with other drives. This is probably due to the fact that in order to make the springs capable of giving satisfactory service as thrust members their arch or camber must be kept small, and this necessarily means that they must be made stiff.

It is well to consider these various advantages and disadvantages of the Hotchkiss drive, but the final decision regarding its relative merits, as compared with the conventional drive, will have to be left to the user. It has been proved that trucks can be built and made to stand up both with the Hotchkiss drive and with separate torque and thrust members. Any superiority in merits on the part of one or the other system must be slight, and we can hardly expect a convincing proof to be given on paper.

Truck Transmissions

IT is generally known that the operating conditions affecting the change gear or transmission are much more severe on a truck than in a passenger car. Gears are changed much more on the truck, which has to operate a great deal in congested traffic; the truck is usually operated by a driver of little skill, and the weight which must be accelerated and decelerated if at the moment of meshing the two gears run at unequal pitch line velocities are very much greater than in a passenger car. Therefore the clashing of teeth where sliding gear transmissions are used is often very severe.

Various engineers in the past have held the opinion that the sliding gear could not be used successfully on trucks. This belief has been disproved by practice. However, we are now reaching a stage of development where it is not a question of what can be used but what is best under the circumstances. And we believe the time has come when the question must be squarely faced whether the jaw-clutch type of gear is not more satisfactory, all things considered. True, it increases the bulk and weight of the transmission, but the destructive clashing is eliminated and it can hardly be doubted that the life of the vital parts is prolonged.

Heretofore the positive clutch type of transmission has not figured very conspicuously in American practice, but as a result of the war and its lessons in regard to various features of design new departures in different branches of automotive engineering are imminent. Rumors of new types of truck transmission are rife. Can it be that the positive clutch type of transmission is about to supersede the sliding gear for truck use?

The Chicago Show

ALTHOUGH technically known as a dealers' show, there is as much of a national aspect to the Chicago exhibition as ever. Manufacturers are just as strongly represented, and their business interest in the exhibition is keener this year than it has been for some time past. In fact, the Chicago affair is both a show and a post-war convention of the industry at which manufacturers of both cars and accessories are meeting their selling or field organizations for the purpose of laying down lines for the reconstruction period.

It must be remembered that in many cases dealer organizations have been rudely broken up by the call of war on the manhood of the country, also that under the stress of war conditions dealers were sometimes cut off by manufacturers who chose to keep a few large dealers alive with their limited production rather than attempt to spread this production so thinly over the country that it would do no dealer any good. In other words, except in the case of large production concerns, the organizations for intensive sales were destroyed.

The Chicago show is always looked upon as the business show of the year. Under present conditions the business end of the exhibit is vital. It is at the convention, which is going on in the different headquarters of the manufacturers in the Congress, Auditorium, Sherman and other hotels, that a great deal of constructive work is being done. Here practically every sales executive in the industry is busily engaged discussing plans for the coming year and mapping out territories. The results of this show are going to be a big factor in determining the production schedule in many factories.

There is also an important retail sales angle to the show, which is generally expected to release buyers. It is felt that what price reductions are to be announced will surely be disclosed at the show, so that in buying immediately after the show the prospect does not need to fear that his purchase will be followed in a few weeks by a price cut. It has been said, further, that the retail market is slow because buyers are holding back waiting for new chassis models. The absence of these at the show will clear this situation also.

Foreign Trade Conditions Improving

GRADUALLY the barriers which have hampered or prevented automobile trade between nations, except for war purposes, during the past several years are being removed. No step has yet been taken to lift the ban of automobile imports for private purposes into England and France, but when the doors are opened again, as they must be some time in the near future, commercial intercourse with these countries will be facilitated by the phenomenal reductions of 66⅔ per cent in ocean freights announced this week. The return of freight rates to a pre-war basis will be hailed with satisfaction by all industries and should result in a quick renewal of pre-war international commercial activities.

In Canada, which for a long time was the best customer of our automobile industry, conditions are also improving. Even as late as 1917 Canada imported a very large number of vehicles, but toward the end of the war the customs duty and local taxes were increased to such an extent as to almost kill the automobile business. This unfortunate result seems to have been noted by the Government, which has lost no time in rescinding the war taxes.

Latest News of the

Passenger Car Market Practically Drained at End of 1918

Only 15,000 Completed Cars on Hand December 31—Truck Production of 327,930 Planned for This Year—Will Make Chiefly 1, 2 and 5-Ton Vehicles

WASHINGTON, Jan. 24—On Dec. 31, 1918, only 15,545 finished passenger cars were in the hands of automobile manufacturers. This represents only three days' normal production—three days' normal sales. At the same time truck manufacturers planned a production of 327,930 motor trucks for 1919—plans made after the armistice was signed—a production of 100,000 trucks more than that of 1918 and based on purely commercial absorption.

These figures exhibiting a passenger car market practically drained and a motor truck business anticipated for the coming year far in excess of even war demands are made public in a letter from C. C. Hanch, Chief of the Automotive Section, War Industries Board, to the industry. The letter states that production of passenger cars in 1918 totaled 926,388 as against 1,740,792 in 1917—a reduction of approximately 50 per cent.

Total motor truck production for 1918 was 227,250 as against 128,157 in 1917. The 1918 production included 164,264 for civilian use as against 109,865 for civilian use in 1917 and 62,986 for military use in 1918 as compared with 18,292 in 1917—indicating a huge increase of trucks for commercial purposes during the war and despite it.

Production of trucks in 1919 as planned by the manufacturers shows a predominance of 1-ton trucks with 2-ton, 1½-ton, ¾-ton, 3½-ton and 5-ton next and in the order named.

A summary of the Government truck business shows 204,760 ordered, 98,000 delivered, 78,081 canceled and the balance of 26,679 due. The Post Office Department has made requisitions on the Army for 17,135 trucks.

Passenger cars ordered by the Government up to Jan. 1, 1919, totaled 38,-

S. A. E. Dinner List Tops 1000

NEW YORK, Jan. 29——More than 1000 tickets have been sold for the Victory dinner of the Society of Automotive Engineers, which is to be held at the Hotel Astor, Feb. 6. Reservations for the Midnight Whirl are above the 500 mark. Seats for both are limited, though a number can still be accommodated.

During the commercial vehicle section of the New York show a meeting will be held at the Automobile Club of America, which will be devoted largely to motor truck subjects. B. B. Bachman, engineer of the Autocar Co., will present a paper on the use of pneumatic tires for trucks. The date of the meeting is Feb. 10.

During the national tractor show at Kansas City there will be a combined dinner and meeting on the evening of Thursday, Feb. 27, at the Hotel Baltimore. A program of farm tractor subjects will be arranged.

Still another meeting of the society is to be held in New York during the Manufacturers' Aircraft Association's exhibition at Madison Square Garden. The date has not been definitely set as yet.

—

White to Make Trucks Only

CLEVELAND, Jan 27—The White Motor Car Co., while not withdrawing from the passenger car field, will devote its entire time to the manufacture of trucks. No passenger cars have been made since the start of the war, and the company does not contemplate putting out a new passenger car at present, but has planned the most extensive truck construction schedule in its history. A new type of White truck has been brought out and will be on exhibit at the New York and Chicago shows.

—

No Army Cars or Trucks to Be Sold

WASHINGTON, Jan. 28—No passenger automobiles or motor trucks have been or are being sold by the army, despite all rumors and reports to the contrary. AUTOMOTIVE INDUSTRIES makes this statement authoritatively, based upon information secured directly from the Motor Transport Corps of the army.

Various reports have been current throughout the East to the effect that passenger cars are being offered to the public by the army in lots varying from twelve to 100, and at ridiculous prices ranging from $300 to $700. Many of the reports even include the name of an imaginary army officer who is credited with offering the vehicles for sale. Army officials here have thoroughly investigated the rumors, probing deeply into the matter but have been unable to determine their origin.

As was announced earlier and officially by the War Department, no passenger cars will be offered for sale and no motor trucks will be placed upon the market except those which are unsuitable for army use. In this event they will be placed on the market. But none of the cars or trucks which will be so sold will be in driving condition.

—

Motor Guests at Aero Banquet

NEW YORK, Jan. 29—The Aero Club of America will hold its thirteenth annual banquet at the Waldorf-Astoria on the evening of Feb. 19.

Rear Admiral Robert E. Peary has accepted an invitation to speak upon flying over the North Pole, and the opportunity for great aerial transportation systems to be extended all over the United States.

Major General Charles T. Menoher, director of the Air Service, will speak on military aeronautics, and Rear Admiral Bradley A. Fiske, U. S. N., retired, will speak upon recent developments in naval aeronautics.

Rodman Wanamaker has accepted an invitation and will undoubtedly have some interesting announcements to make in regard to transatlantic flight.

Among the aces expected to be present are Colonel William A. Bishop, V. C., D. S. O., M. C., D. F. C.; Lieutenant Colonel William Thaw, Captain Edward V. Rickenbacker, Captain Arthur J. Coyle, in command of the First Aero Squadron, and one of the 300 aviators trained by the Aero Club of America in 1915-16, and as many of the American aviation officers from the front as are free to attend.

The Honorable Fiorello H. La Guardia, major in the Air Service and member of Congress, will speak on the developments in aviation in Italy. An invitation has been extended to Signor Gianni Caproni, who is expected to arrive in this country.

—

Army to Keep Soldiers Until Employed

WASHINGTON, Jan. 25—To prevent a serious unemployment situation in this country, the War Department has ordered that no soldier be discharged from the army against his desire until such time as he can obtain employment in civilian life.

—

Roamer to Make Custom Bodies

KALAMAZOO, Jan. 29—The Barley Motor Car Co., maker of Roamer cars, has added a custom body department to its factory, which will enable it to make all roadster bodies as well as open and closed jobs.

Automotive Industries

Detroit Optimistic Regarding Future

Unprecedented Prosperity Anticipated When Contracts Are Adjusted

DETROIT, Jan. 25—Immediate settlement of war contracts will bring to this district an unprecedented era of prosperity. Approximately $300,000,000 outstanding on uncompleted contract work is the brake grinding against the wheels of the automotive and allied industries and it is this brake which will keep the city's great manufacturing plants at slow speed until Congress acts to lift it.

For the most part, this idle money represents working capital. Plants invested heavily in war materials on the assumption that the war would continue for some time. But the war ended abruptly. It caught them just commencing new contracts or in the very midst of government work. Heavy material expenditures had strained their finances and contract cancellation found the mass of contractors short of the funds necessary to meet the unexpected expenditures required for production.

To-day the business outlook was never more golden. There is already a brisk demand for automotive products. Every other line of business is facing a great year. But business here seems to be held in leash. It is waiting for something and that something is action on the part of the big manufacturer. It waits for him to lead the way, but as a purely business proposition he is going to play safe. His resources are badly strained and he in turn is waiting for the Government to refund him his money before he starts operations on a greater scale. While contract delay is not the only factor retarding industrial work during these trying reconstruction days, it is without a doubt the greatest, and its elimination will go far toward dispelling the element of uncertainty now dominating business circles.

The work of transition from gun carriages, airplanes and shell to the production of cars, trucks, tractors, parts etc., is being accomplished with remarkable swiftness and precision in scores of local plants. Over 90 per cent of the automotive plants of the city were engaged in war work of some kind or other. Some factories conducted munition departments and continued their regular automotive departments as well. Others devoted their entire energies to war work.

The automotive industry right now is devoting more of its attention to getting ready for business than in the production of cars, tractors and trucks. In many plants February will find reconstruction work about complete. Sales departments, more or less disorganized when companies were engaged in from 50 to 100 per cent war work, are now reorganizing. New dealers and distributors are being lined up and purchasing departments are busy arranging for parts and material. Sixty days will see the majority of the local firms rounding into normal pre-war production again.

Organization of Director of Sales

WASHINGTON, Jan. 29—The organization of the office of the director of sales of the War Department includes Colonel Fred Glover, who will handle trucks and motor equipment, including motors, motorcycles, side cars and all surplus supplies and repair parts; Colonel A. LaMar, in charge of machine tools, including cranes, storage equipment, steam shovels, etc.; Major W. M. Crunden, who will handle building material; L. H. Hartman, in charge of Quartermaster stores, including rubber goods, gasoline, etc.; G. F. Woods, who will control real estate; Captain A. L. Mercer, in charge of raw materials, including pig iron, platinum, manganese, chrome, etc., and one other who is to be named, in charge of the disposition of ordnance supplies, including artillery, guns, etc. Under the director of sales, C. W. Hard, is an assistant, E. C. Morse, who serves as chairman of the Board of Sales Review, which also includes those officers and civilians named above.

Exporters to Confer on Parcel Post

WASHINGTON, Jan. 29—Second Assistant Postmaster General Praeger has sent out an invitation to exporters throughout the country for a conference to consider important questions and exchange views on the improvement and expansion of the international parcel post. The conference is called for 10 a. m., Feb. 11, at the Post Office Department in Washington.

Withdraw Ban on Aircraft Show

WASHINGTON, Jan. 29—As was announced in a recent issue of AUTOMOTIVE INDUSTRIES, restrictions upon private airplane exhibitions are withdrawn. This announcement, following a cable from President Wilson, has now been confirmed by a proclamation.

826 Farm Tractors in France

According to French Ministry of Agriculture, 779 Are American-Made

By W. F. Bradley

PARIS, Jan. 16 (By Mail)—France possesses 826 agricultural tractors, of which 779 are of American origin. The forty-seven of French manufacture comprise twenty Fitz, twelve Doizy, three De Dion-Bouton, ten Tourand-Latil, and two Julien. These figures are issued by the French Ministry of Agriculture and are official. They appear, however, to cover gasoline tractors only, for there are a certain number of steam tractors in use in France which have not been taken account of.

Although practically 95 per cent of the tractors used on French farms are of American origin, they are not all of a suitable type. During the war the French Government has imported tractors and frequently has purchased what happened to be available, rather than what was most suitable. Very little has been done with tractors for working in vineyards. These tractors should have a maximum width of 39 in. They should be able to plow to a depth of 4 to 6 in., and scarify to a depth of 2 in. These tractors, together with the plow or cultivator, should be able to turn around within a distance of 116 in., and weight should not exceed 2400 lb.

The manufacture of agricultural tractors has been dormant in France during the war, for neither material nor labor was available for this work. All indications point to the tractor business getting into the hands of the automobile manufacturers. Those who are in a position to produce almost immediately are De Dion-Bouton, who has two types of tractors ready and the Latil Co., who has specialized on one type.

Latil is the leading French manufacturer of four-wheel type tractors, which he has been building during the war for the Allied armies. This factory is entirely modern and is well equipped for producing agricultural tractors. The type adopted has been developed by M. Tourand, who has specialized in agricultural work for a number of years.

This combination of an agricultural machinery specialist and an automobile manufacturer is a good one. In France there is a tendency for automobile manufacturers who have good engineering experience, but who possess little agri-

(*Continued on page* 282)

British May Drop Import Embargo

American Automotive Importers in London Have Hopes of Speedy Relief

NEW YORK, Jan. 28—Advices from London, England, state that although much apprehension has been felt by the distributers of American cars, trucks and automotive products generally in regard to the attitude of the British Government on the question of restrictions on imports, it would seem that the chief anxiety exists on account of the possibility of maintaining the wartime embargo, rather than that there will be a partial restriction effected by the imposition of a duty.

The main reason for believing that something along the lines of a maintained embargo would be advocated arose from an interview granted a deputation of British manufacturers by the president of the British Board of Trade, who said he "pledged himself that the restrictions on importations which had been lifted for three months shall be reimposed at the expiration of that period, and that there shall be no further removal without the manufacturers of the country being consulted."

He also stated that he "realized that it might be necessary to impose further restrictions."

Naturally this statement created a certain amount of unrest among importers of American goods and as a result a deputation of the automotive men in London interviewed the head of the Department of Import Restrictions, in the absence of the president of the Board of Trade. This official promptly stated that it was a mistake to suppose that the British Government contemplated a policy of exclusion and added that it was anxious to consider any and all representations made by importers of American made products. He suggested that the automotive importers should draw up a statement of the amount of goods each firm expected it would need to maintain itself until the situation cleared.

It is now considered that there is every hope of relief and that with increased shipping facilities the position of imports of automotive products into the United Kingdom will be greatly facilitated. It is noteworthy that the American automotive men in London were the first to take active steps to ascertain the exact position and the feeling of the British Government in regard to the situation. The deputation was representative of the motor trade group of the American Chamber of Commerce in London.

Simplified Export Application Form

WASHINGTON, Jan. 25—A new and more simple export license application, known as form X-A, has been placed in use by the War Trade Board for applying for export licenses to ship to any country, in place of form X used heretofore. When form X-A is used it will no longer be necessary to use supplementary information sheet X-119 for shipments to Denmark, Holland, Norway or Sweden.

Cheap British Cars a Thing of the Future

NEW YORK, Jan. 23—For the time being at least the United States has little to fear from British competition in the motor industry. British manufacture, hampered and restricted by the war for the past 4 years, will take some time to get back on its feet, according to Gerald Bliss, writing in the London *Daily Mail.* Discussing the very doubtful possibility of cheap car manufacture in England at present he says:

"One of the many post-war mysteries is the price at which motors of all sorts and sizes will be sold, a mystery unknown to the very manufacturers themselves.

"All they can do is to invite the public to put their names down on what are in many cases already very long waiting lists to 'wait and see' in conjunction with themselves.

"Some articles upon the $500 car written during the period of suspended motoring have led a considerable portion of the public to anticipate a sort of 'Rolls-Ford' presenting itself at their doorsteps and asking to be bought at that price for a Christmas present.

"The $500 car will come, but it will take some years of quantity production with our enlarged factories working at full swing under rebalanced peace conditions, and with raw material neither rationed nor being sold under conditions of the keenest competition for limited supplies.

"Meanwhile the present price of the proverb'al Ford (minus any suggestion of the Rolls)—if and when obtained—shows that even in this pioneer case war conditions have put the cost up very considerably, and that it, too, for the time being, shows no eagerness or ability to sell at $500. So what chance for others?

"There are four prime and direct factors affecting the price of cars, not only in this country but others as well, though not so much so in America for reasons more or less obvious. First, the price of raw materials; second, rationed quantities limiting production and fettering organization, thereby raising the all-round cost of running a factory; third, the cost of factory reorganization and the attendant difficulties, and fourth, the great increase in wages all round—not only in motor factories.

"Practically no cars have been manufactured in this country for civilian consumption for over four years. In consequence, second-hand prices for immediate purchasers have been soaring for some time, not without a suspicion of profiteering in certain cases, and the automobile industry in all its branches does not want to be tarred with the same brush.

"In 1914 prices, with stability, improved production and established organization were dropping. Since then there have been no price lists. When the industry is next in a position to issue such official lists cars will be found to be up 40, 50 or possibly even more per cent to start with, and it will look a big jump. But I do not fancy that they will be found to have risen in the same proportion as most other things we have been buying without interruption. That will be the first touchstone of their cheapness. Meanwhile the British industry has to find its feet again."

Canada Expects Car Tax Reduction

Total Taxation Plus Duty Over 50 Per Cent—War Tariff May Be Removed

WINNIPEG, CANADA, Jan. 24—Two Ottawa dispatches of the last few days refer to important tariff revisions and indicate that the automobile, which has been bearing a big burden of the wartime taxes, may shortly be relieved of some of the load. Representatives of the organized automobile industries of Canada recently waited on Sir Thomas White, acting premier, and Hon. A. K. MacLean, acting minister of trade and commerce, urging the removal of the excise war tax on automobiles. This surtax, which was imposed in the last budget, amounts to 10 per cent on all automobiles, and is applicable to imported cars or cars manufactured in Canada and unsold on April 30, 1918. The plea for the removal of this excise duty is being considered by the authorities at Ottawa.

Another measure which it is rumored in Ottawa dispatches will feature in the budget at the coming session is the removal of the general war tariff increase of 7½ per cent, put into force during the early months of the war on almost all commodities. This, of course, has been tacked on to the high cost of automobiles for some time, and its removal will be a relief to dealer and consumer.

Prospective buyers who have watched the soaring prices of motor cars during the past year or two have no doubt attributed most of the increase to the rising costs of materials and labor. Few, probably, have been aware of the taxes borne by the automobile since August 4, 1914.

The original duty at that date was 35 per cent. Shortly after war broke out, the Canadian Government imposed the war tariff increase of 7½ per cent; total tax from that date onward—42½ per cent. Then the United States placed a 3 per cent tax on factory output. This increased the cost of the car to the dealer 3 per cent, and he was also forced to pay the 42½ per cent on this additional 3 per cent. Then along came the Canadian excise war tax of 10 per cent on the list price of the car and freight increases have jumped just about 100 per cent.

American and British Governments Cut Ocean Freight Rates 66 Per Cent

NEW YORK, Jan. 28—The British Ministry of Shipping announced yesterday that ocean freight rates on vessels free from Government requisition had been reduced 66 2-3 per cent on shipments from the United States to Great Britain. This applies to all export commodities except cotton, and it also applies to British ships which have from 20 to 30 per cent of their cargo space available, the remaining being under control of the Ministry of Shipping.

To meet this cut the United States Shipping Board announced a similar reduction in charges between Atlantic and Gulf ports and the United Kingdom, France, Italy, Belgium and the Netherlands.

Approximately, the reduction means a drop from $3.50 to $1 per 100 lb. and a reduction from $1.75 to 50 cents per cubic foot for goods shipped by measurement. Shipping men say that even with the present high cost of operating vessels the new rates will leave a margin of profit.

Mexico Sends 3,838,195 Bbl. Oil Here in November

WASHINGTON, Jan. 25—Declared exports of crude oil and petroleum products from Tampico, Mexico, to the United States in November, 1918, totalled 3,838,195 bbl. The movement from Tampico was 2,575,700 bbl., from Tuxpam 852,094 bbl. and from Port Lobos 410,401 bbl. Shipments to points other than the United States during the same period from this district totalled 1,617,542 bbl.

December Oil Exports Decrease

WASHINGTON, Jan. 27—Mineral oils totaling 2,714,430,452 gal., valued at $344,290,444, were exported during the year of 1918, as compared with 2,651,118,349 gal., valued at $2,252,977,476, in 1917. December, 1918, shipments of mineral oils totaled 186,723,651 gal., valued at $29,027,415, as against 300,286,827 gal., valued at $29,173,907, in December, 1917. The decrease in quantity in December, 1918, was undoubtedly due to the armistice. Following is a tabulation of the complete exports during December, 1918, and December, 1917, and the years 1917 and 1918:

Months	1917	1918
January	47,967,354	42,607,206
February	41,352,711	44,384,937
March	47,868,652	48.631,115
April	41,854,320	46,590,570
May	47,086,452	50,927,195
June	46,824,646	51,758,214
July	46,291,572	55,587,312
August	47,372,226	55,782,092
September	45,107,956	51,757,334
October	48,387,726	52,885,518
November	47,689,801	44,386,987
December	44,037,147	40,684,525
Total	551,790,563	585,888,000

Imports to Mexico Exempt from Tax

WASHINGTON, Jan. 25—In view of the export figures of cars, trucks, parts, etc., from the United States to Mexico for the past few years, the report received here from Ambassador Fletcher should be of importance to those engaged in automotive export lines. According to this report, exemption from import duties has been granted on motor vehicles of all descriptions by the President of Mexico under a decree signed last week.

From 1908 to 1918 exports of passenger cars from the United States to Mexico were 7,540 cars at a value of $6,462,511. Within the past six years Mexico received from the United States 249 motorcycles, valued at $64,830; 689 trucks, valued at $939,679; nine airplanes at a value of $68,500, and airplane parts to the amount of $19,725.

France Provides for War Car Repairs

Makers to Repair French Cars —Army Shops to Handle Foreign Makes

PARIS, Dec. 23—Definite announcement has been made by the French Government on the method of handling the trucks and cars it has in its possession and which will no longer be required when the armies are disbanded. The total number of vehicles is 79,318, composed as follows:

French-built Vehicles	
Trucks	34,385
Tractors	4,812
Touring cars	19,044
	58,241

Foreign-built Vehicles	
Trucks	13,360
Tractors	2,217
Passenger cars	5,500
	21,077

All the French built cars and trucks will be returned to their respective manufacturers in order to be repaired at Government expense, and will then be sold through the usual dealers. If the manufacturer refuses to take back his cars for this repair work, they will be turned into the army repairshops for the necessary work. When the vehicles are returned to the manufacturer for repair and sale, it is understood that a price will be fixed by mutual agreement, and also the commission which the manufacturer and the dealer will be allowed for their part in the transaction.

Foreign built automobiles and trucks will all be repaired in the army shops. It is intended to form a company in which all the big transportation organizations will have a part, which will take over all the foreign-built automobiles now in the French army and such French automobiles as the manufacturers refuse to handle. This company will thus have to receive a minimum of 20,000 automobiles, but in case the manufacturers do not care to handle their own vehicles, may have to receive more than 50,000.

The company will rent the vehicles placed in its possession to whatever organizations are in need of transportation. These will include many of the local railroad companies, the various municipalities in the devastated and other regions, builders undertaking reconstruction work, etc.

The holding company will be responsible for the maintenance of these automobiles so long as it is possible to keep them in service. As the vehicles wear out they will be scrapped, and the importance of the holding company will gradually decrease.

Although not forming a part of the Government scheme, it is known that many American manufacturers having cars and trucks now in the service of the French army will establish supply depots in order to help keep these trucks in service. Without such depots it is obvious that the cost of maintenance will soon run so high that the trucks will have to be abandoned at an early date.

An impression has gotten abroad in France that automobiles owned by the English and American armies would be left behind, and would have to be absorbed by the French nation. This is quite incorrect. The British authorities have arranged for all English army trucks to return to England, and the American army will send across the Atlantic the 81,000 automobiles it now possesses in France—or, at any rate, as many of them as are worth shipping home.

Automobile Manufacturers of France Entertain Louis Renault

PARIS, Jan. 12—Louis Renault was the guest of honor yesterday at a banquet given by the Automobile Manufacturers of France, in order to commemorate his promotion to the rank of officer of the Legion of Honor, which was awarded him because of the important role his factory has filled during the war and particularly for the designing and production of the Renault light tank.

This tank was designed late in 1917 and went into action in the beginning of 1918. Louis Renault equipped his factory to produce 12 tanks per day and when the armistice was signed had delivered about 2,500. In addition, the tank was built in accordance with his designs by other factories in France, Italy and America.

The banquet, which was attended by all the leading members of the automobile industry, was presided by M. Loucheur, who, during the war, was Minister of Armaments, and now occupies the post of Minister of Industrial Reconstruction.

Egyptian Cotton Import Restrictions Off

WASHINGTON, Jan. 26—The War Trade Board has removed all restrictions on the importation of Egyptian cotton, except as to the relations with the Textile Alliance, Inc., but it is still too soon to estimate its effect on tire manufacture. In fact, since the restrictions are off, none of the raw Egyptian cotton has had time to come into the country. During the past year, however, while the regulations were in effect, only about 50 per cent of the usual amount of 100,000 bales of Egyptian cotton came into this country. Of that amount the Government took about three-fourths for its own needs, leaving only 25 per cent for the manufacturers. As a result, tire makers were forced to manufacture with domestic cotton, which did not prove as satisfactory as the imported.

Licenses will now be granted freely for the importation of cotton of all grades from any country when the applications are otherwise in order. As the importation of Egyptian cotton is largely a question of steamship space, even with the restrictions off, the amount brought into this country will depend on the amount of shipping space available.

Consider Validating Measure

Senate Starts Hearings on Bill to Legalize Contracts —Two Amendments

WASHINGTON, Jan. 28—Consideration of the bill to validate informal war contracts was begun by the Senate yesterday. The contracts, which total $2,000,000,000 and include $300,000,000 worth of business with automotive companies, are those which were not formally made. The bill, which was published in these columns last week, permits the Secretary of War to adjust the contracts and provides for a commission to which appeals may be taken if Secretary Baker's decisions are unsatisfactory.

Senator Chamberlain, in charge of the bill, stated that delay in passage of the bill will bring disaster upon the country, continue to increase unemployment and work serious hardships upon industry.

A three-cornered discussion took place when adherents of the Dent bill, which has already been passed by the House and which was published in these columns several weeks ago, attempted to urge their bill, and Senator Hitchcock in turn spoke in behalf of a bill he has presented at the behest of the New York City Chamber of Commerce, while Senator Chamberlain demanded the passage of his bill at an early date. No definite action was taken.

Senator Hitchcock offered an amendment which was characterized as an attempt to again place complete charge of validation of informal contracts in the hands of the War Department, and Senator Pomerene offered an amendment to "protect the sub-contractors."

Following is the amendment suggested by Senator Hitchcock, which was ordered printed and will be laid before the Senate to-day:

"In line 3, page 1, after the word 'that' strike out all down to and including line 24, page 3, and insert the following:

"Where during the present war and prior to November 12, 1918, officers or agents acting under authority of the Secretary of War and placed orders or made contracts with manufacturers or contractors for war supplies or materials, or for the performance of work thereon, or for the construction or enlargement of plants or other preparations necessary to furnish supplies or material for the War Department, the procurement of which has heretofore been authorized by Congress, and any of said orders or contracts has been partly or wholly performed, or expense has been incurred by the manufacturer or contractor prior to the twelfth day of November, 1918, in preparation or partial execution of said contract or order, the fact that any such contract or order or agreement has not been made in the form or signed in the manner required by law shall not invalidate the same, if it was entered into in good faith and lacked only the sanction of a contract in legal form. Nothing herein provided, however, shall be held to validate any contract, order, or agreement given or made by an officer or agent of the War Department not legally qualified or authorized to give a formal legal contract, except where such officer has signed as the representative of a superior officer authorized to make such contract, nor to permit an officer to make such contract with any company, corporation, or firm in which he has, or had at the time, directly or indirectly any interest.

"Sec. 2. That in all cases as above included it shall be lawful to make payments under the terms of the contracts or orders so made or given to the extent that performance thereof has been made, expenditures incurred, or supplies thereunder have heretofore been received and accepted by the United States, provided that payment in such cases shall not exceed the fair value of the supplies or materials delivered to and accepted by the United States, together with remuneration for expenditure properly incurred in preparing to perform said contract, orders, or agreements.

"Sec. 3. That in case of the cancellation, suspension, or annulment of any contract, order or agreement as described in this act, by the Secretary of War, or officers or agents acting by his authority, and in cases where no property or supplies have been delivered to and accepted by the United States, or where only partial delivery and acceptance has been made, contractors shall file with the Secretary of War within 60 days after the passage of this act any claim for remuneration arising out of the discontinuance, cancellation, or suspension of such contract, agreement, or order, properly itemized and set forth. Each claim shall thereupon, or as soon as possible, be transmitted to and filed with the commission hereinafter provided for, together with a statement attached thereto, showing the amount, if any, which the War Department deems to be justly due to said claimant. If the claimant shall file a statement offering to accept the amount awarded by the War Department in full for said claim, the commission shall, within 10 days, order the same paid in the absence of evidence that it is excessive.

"Sec. 4. That for the adjustment of all claims arising out of the cancellation of contracts, orders, and agreements for supplies or materials of war, as described in the foregoing paragraphs of this act, there is hereby created an adjustment commission to be composed of 3 members, to be appointed by the President and confirmed by the Senate, one representing the War Department, one representing the Department of Justice, and one representing the business interests of the country, none of whom shall be interested in any contracts with the Government or have any interest in any firm or corporation having war contracts, who shall hold their offices for 1 year and receive as compensation a salary of $10 000 each. It shall be the duty of said commission promptly to examine and pass upon all claims for compensation and reimbursement arising out of cases as set forth in this act of supplies furnished, expenditures or obligations necessarily incurred, or materials purchased under faith of contracts in legal form or orders received from officers and agents of the Secretary of War as heretofore set forth.

"Sec. 5. That in each case, as soon as the commission has made an award, the contractor shall be entitled to receive the same upon giving receipt in full of all demands against the United States arising out of the transaction, or if the contractor is not satisfied with the amount so awarded he shall be entitled to receive, and shall receive at once, 75 per cent of the amount that has been awarded him, and he shall thereupon be entitled to appeal the case to the Court of Claims, which is hereby given jurisdiction to hear the case and render final judgment in such sum as may be required to reimburse the contractor for supplies and materials delivered to and accepted by the United States and expenditure necessarily incurred in good faith in the partial performance of the contract or order above referred to, or in preparing for the same.

"Sec. 6. That in no case, however, shall any award, either by the commission or the Court of Claims, include prospective or possible profits on any part of the contract beyond the goods and supplies delivered to and accepted by the United States and a remuneration for expenditures necessarily incurred in preparing to perform said contract or order so canceled.

"Sec. 7. That the purpose of this act being to secure prompt settlement of claims, the commission is authorized to make its own rules and regulations and to hear and determine the issue informally and promptly upon presentation of the case. The commission is authorized to appoint, under such rules and regulations as it shall prescribe, one or more regional boards of examiners to serve in such districts throughout the country as the commission shall fix and determine to investigate and determine the facts concerning claims, legal or equitable, that may be presented as herein prescribed. The members of such board shall be composed of one representative of the War Department, one representative of the Department of Justice, and one from the business interests of the region, none of whom shall have any interest in the contract, directly or indi-

Makers Discuss Plans of Loading

N.A.C.C. and Master Car Builders Confer on Method of Freight Car Loading

DETROIT, Jan. 24—A meeting to determine how motor vehicles should be loaded for shipment was held Thursday, Jan. 23, at the Board of Commerce. It was arranged by the National Automobile Chamber of Commerce and J. S. Marvin of that organization, explained that the purpose was to receive from army officers and the Master Car Builders' Association their proposed specifications and blue prints to govern the loading of motor vehicles on freight cars.

This follows a preliminary conference at Washington a month ago, and as a result of the meeting the Government officials are to be furnished with specifications and other data showing the present loading methods of the various factories here. Many suggestions were made by the shippers and the changes in the proposed rules adopted. It was expected that further changes would be made before the final approval of the rules which will be binding on all shippers when printed and approval by the Railroad Administration.

This matter is of vital importance to the motor vehicle makers, many of whose shipments run from 50 to 100 carloads per day, and any serious deviation in the fastenings of the machines in the cars for transportation makes an important item of expense, weight of load and liability of damage.

The meeting was attended by Captain H. R. Moody, chief of the packing and service division, Quartermaster Corps; Captain E. S. Evans of the same department; J. J. Burch, chairman, and other members of the committee on loading, Master Car Builders' Association; L. J. Markwardt and H. J. Hegal, forest products laboratory, Forest Service, U. S. D. A.; William E. Metzger, chairman, traffic committee, National Automobile Chamber of Commerce; E. N. Hodges, chairman of the Detroit traffic committee of that organization and representatives of the following motor vehicle manufacturers: Anderson Electric Car Co., Cadillac, Chalmers, Dodge, Denby, Ford, General Motors, Hudson, Hupp, King, Maxwell, Packard, Paige, Saxon, Scripps-Booth and Studebaker, Detroit; General Motors Truck Co., Pontiac; Reo Motor Car Co., Lansing; Buick and Chevrolet Motor companies, Flint, and Nordyke & Marmon Co.

Moline Plow Co. Earns 9.14 Per Cent

MOLINE, ILL., Jan. 28—The Moline Plow Co., having changed its fiscal year, has issued its report for the fifteen months ending Oct. 31, 1918. Net profits are $2,038,779, after deducting all operating expenses, allowing for depreciation of fixed assets, for interest on borrowed money and for bad debts.

Deny Labor Surplus Reports

Congressmen Point Out Condition Is Temporary—Suggest Propaganda

WASHINGTON, Jan. 27—Congress will devote much time this week to the labor situation, and is expected to pass Senator Kenyon's bill providing $100,000,000 as an emergency fund to start public works to employ those now unemployed.

Reports of labor surpluses at various sections of the United States were denied in Congress last week by a number of Congressmen. The surplus of labor reported by the Department of Labor as existing in the State of Washington was said to be actually a result of a strike and this, it was stated, could not be called a real surplus. Youngstown, Ohio, and other points reported as having large surpluses of workers and being in serious condition by the Department of Labor, were said by Congressmen to be in much better condition than reports indicated.

The fact that Congress has held up the payment of informal contracts is regarded as a very important reason for whatever unemployment exists. Employers, it was said, waiting for their payments from the Government on war contracts, planned to use these funds for engaging in normal peace time production and are unable to take on workers until they are paid.

There are also reports that the official statement indicating labor surpluses and similar announcements from organized labor form a propaganda in part designed to secure future army wages for discharged soldiers and also in part to slacken the demobilization and thereby maintain labor shortage and consequently the war wage standards.

—

Consider Validating Measure

(*Continued from page* 274)

rectly, and receive no compensation, save and except such per diem compensation as shall be fixed by the commission. Whenever the commission shall refer to any such regional board of examiners any claim they shall proceed informally to hear the parties, take the proofs, and return the same promptly to the commission with their recommendation thereon.

"Sec. 8. That the sum of $50,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in the Treasury not otherwise appropriated, for the reasonable expenses of said commission, to be paid out upon the warrant of the chairman, who shall be chosen by the commission from among their own members, and approved by the secretary, who may be selected by the commission, and who shall receive a salary of not exceeding $5000 for the period of 1 year, or so much thereof as may be necessary, to be determined by the commission."

Amend the title so as to read: "A bill to legalize informal or defective orders for war supplies and materials: to provide for the cancellation of orders and contracts, for the reimbursement of contractors and manufacturers, for the adjustment of claims on canceled contracts or orders, to provide for the partial payment of awards pending final determination, and for the creation of an adjustment commission."

Following is the amendment suggested by Senator Pomerene for the protection of subcontractors:

"Whenever, under the provisions of this act, the Secretary of War shall make an award to any prime contractor who shall have sublet any part of said contract for material, equipment, or supplies to any other person, firm, or corporation who has in good faith made expenditures, incurred obligations, rendered service, or furnished material, equipment, or supplies to any prime contractor, with the knowledge and approval of any agent of the Secretary of War duly authorized thereunto, the Secretary of War shall apportion the amount of said award justly due to each of the subcontractors of said prime contractors. Before payment of said award the Secretary of War shall require any prime contractor to present satisfactory evidence of having paid said subcontractors or of the consent of said subcontractors to look for their compensation to said prime contractor only; and in the case of the failure of said prime contractor to present such evidence or such consent, the Secretary of War shall pay directly to said subcontractors the amount found to be due under said award; and in case of the insolvency of any prime contractor the subcontractor of said prime contractor shall have a lien upon the funds arising from said award prior and superior to the lien of any general creditors of said prime contractor."

Standard Parts Back to Peace Plan

CLEVELAND, Jan. 29—In placing its operations on a peace-time basis, the Standard Parts Co. has reinstated the plan of separate general management for its various plants. This method replaces the centralizing of all activities in the general offices which was made necessary in order to conserve man power during the war and especially during the time when a great part of all production was for one customer, viz, the Government. The executive and supervisory offices, credits, collections, disbursements and contracting for the larger material supplies will remain in the general offices.

The several plants will be under general managers as follows: Standard Welding plant, H. H. Newsom; Perfection Spring plant, F. F. Grimmelsman; Bock Bearing plant, George H. Kleinert; American Axle and Cincinnati Axle plants, both producing Stan-Par Axles, D. K. Moore, with headquarters in Cleveland; Canton Spring and Canton Forge plants, J. B. Childe; Connersville Spring and Axle and Wheeling Axle plants, E. V. Overman, with headquarters in Cincinnati; Pontiac Spring plant, B. A. Litchfield; Flint Spring plant, R. T. Armstrong; St. Louis Spring plant, N. B. Champ; Perfection Heater plant and Spring Jobbing division, B. R. Winborn.

Harry S. Harkness is Dead

NEW YORK, Jan. 24—Harry S. Harkness, formerly president of the Sheepshead Bay Speedway Corp., died last night at his home in this city. He was 38 years old. Mr. Harkness was one of the first automoblie owners to drive his own car in races, and competing against a number of the wealthy owners who in earlier days drove their own cars in contests. He was also a pioneer aviator.

—

Kentucky Wagon Buys Dixie

LOUISVILLE, Jan. 28—The Kentucky Wagon Manufacturing Co. has purchased the Dixie Motor Car Co. and is preparing to materially increase the production of Dixie cars. The Kentucky company manufactures Old Hickory motor trucks.

Reports Show Labor Surplus

U. S. Employment Service Says 25% of Cities Report Shortage; 60% a Surplus

WASHINGTON, Jan. 27—Labor conditions, according to reports from the Department of Labor, are serious and growing more so. The United States Employment Service of the Department of Labor, which has for several weeks insisted that there is a labor surplus and a consequent unemployment, despite contrary reports from many localities, states that 25 per cent of the cities reported shortages of labor, 60 per cent that the supply equals the demand, and 12½ per cent a surplus of labor on Dec. 10, 1918.

From that date until the current week, says the department, there has been a steady decrease in shortage and an increase in surplus reported, and telegraph reports during the current week indicate that 13 per cent of the cities have a shortage of labor, 44 per cent have a surplus and 43 per cent have a supply equal to the demand. On Dec. 21, six States reported a surplus of labor, according to the statement, and during the current week twenty States reported a surplus.

On Dec. 3, there was a total shortage of labor of 34,000 reported and a surplus of 12,000, and during the following eight weeks this shortage was reduced to 12,000 and the surplus increased to 210,000.

New England reports indicate a surplus in practically every center. New York State reports a surplus of labor in every large city. New Jersey reports a supply equal to the demand. Pennsylvania reports indicate shortages of labor everywhere except at Erie, which has a heavy surplus. Ohio has a surplus of labor totalling 55,000 in Cleveland, 10,000 in Toledo and 7000 in Dayton.

The Middle West reports a surplus of 30,000 workers at Detroit, 4400 at Indianapolis and 400 at Minneapolis, with surpluses reported from most every other point. There is a slight demand for machinists. The copper districts are suffering serious conditions. Copper producers are unable to market their total outputs, and are laying off workers. Nebraska reports a shortage of workers.

In the South there is some demand for miners and agricultural help, while Savannah, Ga., reports shortage of mechanics, ship yard workers, and Delaware, Kentucky and Virginia have shortages of machinists and ship yard workers. Tennessee, North Carolina and Florida are suffering from a surplus.

—

More Import Restrictions Lifted

WASHINGTON, Jan. 29—Restrictions upon the importation of pyrites, graphite, plumbago and graphite crucibles have been removed by the War Trade Board and licenses will now be issued freely.

Overland to Divide Profits with Men

Capital and Labor Will Split 50-50 After Provision for Wages and Normal Profits

TOLEDO, Jan. 27—A profit sharing plan whereby the Willys-Overland Co. will divide profits equally between capital and labor after wages and normal profits in relation to the capital invested are taken out was announced by John N. Willys at a meeting of the foremen of the plant held to-day.

The profit sharing plan will be retroactive to Jan. 1, 1919, and the wage scales in effect from time to time will not be affected. Mr. Willys' statement, in part, follows:

"After permanent capital and permanent labor have each been justified, having due regard to the cost of each, the cost of capital and the cost of living, then the additional profits accruing from the joint employment of permanent capital and permanent labor shall be divided between them, 50-50. The detailed plan, when ready to present, will recognize and reward individual efficiency, departmental efficiency and increasing reward for continuous service, and these plans will have no influence on periodical adjustment of wages."

It is understood that every employee of the Willys-Overland factories will be affected and that if the plan proves satisfactory in operation it will be extended to the subsidiary plants.

Two Official Entries for Indianapolis Race

NEW YORK, Jan. 27—Two official entries have been received for the 500-mile Liberty sweepstakes on the Indianapolis Speedway on May 31. R. C. Durant will drive a Chevrolet special model, and Ralph Mulford will drive a Frontenac. Opening races on the Uniontown, Pa., speedway have been sanctioned for May 17.

19,500 Ft. Altitude Record for Monoplane

WASHINGTON, Jan. 25—A record for altitude in a monoplane has been made by Major R. W. Schroeder. The War Department received a telegram yesterday from the commandant at McCook Field, Dayton, that Major Schroeder, with two passengers, in a monoplane climbed to a height of 19,500 ft. in 31 minutes. With him were Lieutenant George V. Elsy and K. A. Craig, a mechanician. The previous record for a machine of this type is said to be about 16,000 ft. The plane was built by Grover C. Loening of Long Island City, N. Y., and was powered with an 8-cylinder engine. It has developed a speed of 145 m.p.h.

Aviation Secretary for Cabinet

Creation of Air Bureaus Suggested to Develop Mechanical Flight in U. S.

WASHINGTON, Jan. 23—Creation of a separate air department, with its head a member of the Cabinet, was advocated yesterday by Senator Chamberlain of Oregon, chairman of the Senate Military Affairs Committee, in a statement in which he expressed the belief that the control of the air would "unquestionably be the decisive factor in the next war, overshadowing in importance the forces on either land or sea."

"The United States," said Senator Chamberlain, "ought to profit by the experiences of the war with Germany and formulate a constructive program accordingly. We ought to continue to manufacture airplanes in reasonable quantities, but, more than all, we should endeavor to develop mechanical flight, so as to be able, should the emergency arise, to maintain control of the air.

"The air problem in the future seems to rest on efficient co-ordination. It is for this reason that we—speaking for a majority of the members of the Senate Military Affairs Committee—recommend a unification of effort and still urge such a policy. What I would like to see would be the creation of a separate air bureau or department, whose head shall sit in the cabinet along with the Secretaries of War and Navy."

Platinum Imports

WASHINGTON, Jan. 27—Imports of platinum into the United States during the year ended June 30, 1918, totaled 48,745 troy ounces unmanufactured, and 3117 ounces of ingots—bars, plates, etc. Following is a table showing the imports by countries of origin:

	Unmanufactured		Ingots, bars, plates, etc.		Vases, retorts,
From—	Troy ounces.	Value.	Troy ounces.	Value.	Value.
France	166	$18,142	814	$78,674	....
Netherlands	....	....	....	....	$165
England	1,073	80,834	357	29,614	....

Totals	48,745	$4,308,518	3,117	$264,096	$2,547

Commercial Airplane Tests Permitted

Use of McCook Field by Companies or Individuals Authorized by War Department

WASHINGTON, Jan. 27—Peace-time development of aircraft was given an impetus to-day when the War Department authorized the use of McCook Field, Dayton, Ohio, for testing of experimental planes by individuals or private companies. The regulations provide that all unofficial tests will be at the owners' risk and expense and after examination of the planes by army experts to determine the safety of the trials in the air.

Official tests will also be conducted at McCook Field by Army pilots experienced in experimental work. Owners desirous of having official tests made must submit two planes, one for destruction tests and one for performance. The Government will defray the expenses of official tests.

Following are the complete regulations applying to both private and official tests:

1. The Chief of the Technical Section is charged with the responsibility for all tests of experimental airplanes at Air Service fields.
2. Such tests will be conducted at McCook Field, Dayton, Ohio, unless otherwise permitted by the Director of Military Aeronautics.
3. Such tests will be entirely at the owner's risk and expense, and he shall supply the pilot therefor. No Air Service pilot will be permitted to engage in these tests.
4. Flight tests will be permitted only after a technical examination by a representative of the Technical Section. If, in the opinion of this officer, the airplane is unsafe to fly, no flight will be permitted at an Air Service field.

Official tests of experimental planes will be authorized only at McCook Field, Dayton, Ohio, and under the following conditions:

1. The owners of such airplanes must submit 2 models—one for destruction test and one for performance test.
2. Tests will be at Government expense and the flight test will be made by an Army pilot detailed by the Chief of the Technical Section.
3. Flight tests will be permitted only after a technical examination and sand-test by a representative of the Technical Section. If, in the opinion of this officer, the airplane is unsafe to fly, no flight will be permitted at an Air Service Field.

Pilots unexperienced in flying experimental airplanes will not be permitted to fly such planes until after they have been placed "in production."

Commanding officers at Flying Fields will be held strictly responsible that no flights are made at their fields in violation of the foregoing instructions.

Civilian Flying Unrestricted

WASHINGTON, Jan. 24—The Joint Army and Navy Board on Aeronautic Cognizance has removed restrictions on civilian flying, and will grant permits to all qualified civilians who apply under the President's proclamation of Feb. 28, 1918.

Until the action of the Joint Army and Navy Board on Aeronautic Cognizance, civilians were only permitted to fly experimental machines and then only under permits from the Board.

Applications from civilian pilots should be addressed to the Joint Army and

Navy Board on Aeronautic Cognizance, Building "D," Sixth and B Streets, N. W., Washington, D. C., Lt. L. G. Haugen, A. S. A., Secretary.

Cars and Trucks Only for Omaha Show

OMAHA, Jan. 28—Omaha's fourteenth annual show will be an exhibit of passenger cars and trucks only, and will be bigger than any in the past.

The show is set for March 10-15. It will be staged in the Auditorium, a building occupying half a block, and affording one floor and a small basement. To this the directors of the Omaha Automobile Trade Association have decided to add the McCaffrey-Ford Building adjacent, which gives a quarter of a block more space, and possibly the building of Andrew Murphy & Son, comprising the remaining quarter block. Part of the McCaffrey Building was utilized last year.

Thus the whole show, with more floor space than ever before, will yet be housed in a single, solid block. But no tractors or accessories will be shown, unless it is by the enterprises of the individual dealers in their separate showrooms.

$300,000,000 for Road Improvements

WASHINGTON, Jan. 27—About $300,000,000 will be put into road building this year, according to estimates by experts of the Department of Agriculture, submitted to the Division of Public Works and Construction Development of the Department of Labor. It is understood that about half this amount will go to labor.

The $300,000,000 of construction estimated will not be sufficient to make up deferred war construction, it is believed, for normally the amount spent on roads in the United States is not far below $300,000,000. During the war road building almost came to a stop in many states.

Estimates prepared for the following States are considered accurate within one or two per cent, according to officials of the Department of Agriculture: Maine, $1,500,000; Rhode Island, $90,000; Connecticut, $4,000,000; New York, $12,000,000; New Hampshire, $175,000; Kentucky, $1,500,000; Alabama, $1,000,000; West Virginia, $16,000,000; Illinois, $9,000,000; Iowa, $15,574,000; Louisiana, $4,674,000; Texas, $20,000,000; Nebraska, $1,657,089.07; North Dakota, $3,000,000; Wyoming, $653,000; Colorado, $3,900,000; California, $20,000,000; Arizona, $900,000; Nevada, $1,148,849.80; Idaho, $1,000,000. New Jersey, Maryland and Montana are expected to make considerable expenditures on roads this year.

Increase Road Cost Limits

WASHINGTON, Jan. 27—The House Committee on Roads yesterday favorably reported a bill increasing the limit of cost of roads to be built with Federal aid from $10,000 to $15,000 per mile.

This action was taken to permit the various States to proceed with projects stopped by the Government's fixing the limit to be paid for construction at a figure at which no contracts could be placed.

"The construction of public works," said the report, "is recognized throughout the country as one of the means for solving the questions of unemployment due to cessation of the production of materials required for carrying on the war."

Road Builders Meet in New York

Will Discuss Efficient Methods of Road Building and Maintenance Feb. 25-28

NEW YORK, Jan. 25—The Ninth American Good Roads Congress and the Sixteenth Annual Convention of the American Road Builders' Association will be held at the Hotel McAlpin, Feb. 25-28. It is planned to devote Feb. 25 and 26 to the presentation and discussion of papers and the 27th and 28th to the consideration of reports of committees. The business session will be held on the afternoon of Feb. 28, and the annual banquet on the evening of the 26th or 27th. It is proposed to show motion pictures pertaining to highways on two evenings during the congress.

Among the subjects to be discussed are:

National Highways and Federal Aid for State Highway Improvements.
Relation of Highways to Railways and Waterways.
Efficient Methods of Contracting for Highway Work During the Reconstruction Period.
Efficient Methods of Promoting Highway Bond Issues.
Efficient Methods of Drainage for Different Geological Conditions.
Foundations for Heavy Horse-Drawn and Motor Truck Traffic.
Methods of Maintaining Highway Systems Prior to Construction by the State or County.
Economic Utilization of Labor Saving Machinery.
Cost Keeping for Highway Contractors.
Street Systems, Their Relation to Highways Outside of Urban Districts.
The Efficiency of the French Broken Stone Roads During the War.
Efficiency of Bituminous Surfaces Under Motor Truck Traffic.
Recent Developments in the Construction, Maintenance and Reconstruction of Cement Concrete Pavements.
Present Status of Brick Pavements Constructed with Sand Cushions, Cement Mortar Beds and Green Concrete Foundations.
Recent Practice in the Construction of Stone Block Pavements.

Committees will submit reports on the following subjects:

Regulations Covering Speed, Weight and Dimensions of Motor Trucks.
Methods of Financing Highway Improvements for States, Counties and Towns.
Civil Service Requirements for Highway Engineering Positions.
Sources of Supply of Unskilled Labor for Highway Work.
Convict Labor on Highway Work: Organization, Administration, Camps and Cost Data.
Reconstruction of Narrow Roadways of Truck Highways with Adequate Foundations and Widths for Motor Truck Traffic.
Methods of Strengthening and Reconstructing Highway Bridges for Heavy Motor Truck Traffic.
Efficient Methods of Snow Removal from Highways Outside of Urban Districts.
Guarantees for Pavements on Roads and Street.
Uniform Highway Signs.

Because of the war, it was decided to postpone the exhibit of road machinery, equipment and materials until next year.

Good Roads Chairmen Appointed

LANSING, Jan. 24—The executive committee appointed by Governor Sleeper to arrange for establishing rural motor truck routes in every county in the state met Wednesday, Jan. 22, and adopted a resolution favoring the senate bill for amending the state constitution to allow state appropriations for good roads. The following chairmen of counties were appointed:

Ottawa, Nathaniel Robbins, Grand Haven; Kent, Fred A. George, Grand Rapids; Ionia, M. Chapman, Ionia; Muskegon, S. H. Klink, Muskegon; Newago, J. B. John, Newago; Montcalm, F. E. Runney, Greenville; Osceola, A. R. Davey, Evart; Oceana, Thomas Reed, Shelby; Mecosta, George F. Fairman, Big Rapids; Mason, C. H. Curtis, Ludington; Lake, G. F. Duffey, Baldwin; Manistee, R. M. Hoffman, Manistee; Wexford, Henry M. Knowlton, Cadillac; Missaukee, Henry Curtis, Jennings; Benzie, J. H. Hoffstetter, Frankfort; Kalkaska, J. H. Greacen, Kalkaska; Grand Traverse, F. H. Hamilton, Traverse City; Leelaneau, D. H. Day, Glenhaven; Charlevoix, Harry Nichols, Charlevoix; Emmett, A. L. Deuel, Harbor Springs; Sheboygan, H. A. Frombach, Sheboygan; Antrim, E. R. Harris, Ellsworth; Otsego, S. W. Buck, Gaylord; Crawford, T. W. Hansen, Grayling.

National Highway Conference Invitation

NEW YORK, Jan. 25—A conference on "Regulations Covering Speed, Weight and Dimension of Motor Trucks" will be held under the auspices of the National Highway Traffic Association at the Automobile Club of America, 247 West Fifty-fourth Street, at 8 p. m. on Friday, Jan. 31. An informal dinner, at $1.50 a cover, will be served in the grill room of the club at 6.30 p. m. Those interested should address Secretary Elmer Thompson, 247 West Fifty-fourth Street.

No Truck Show for Boston

BOSTON, Jan. 25—Manager Chester I. Campbell has announced that there will be no commercial vehicle show here this year unless something unforeseen develops. The basement of Mechanics' Building is filled with goods which it was believed belonged to the government. When an appeal was made to the Federal officials to move the stuff and an investigation was made, it was found that the things were owned by the Quincy Market Cold Storage Co. of Boston. And as the owners of Mechanics' Building are getting a big rent for the basement they are not in any hurry to get rid of the goods to accommodate the automobile association. One last effort is being considered, that of appealing to the Boston Chamber of Commerce, to try to have that body interest the owners to remove the goods, but it is not believed that this will be successful.

Muskegon Holds Third Annual Show

MUSKEGON, Mich, Jan. 27—Muskegon will hold its third annual show at the same time Detroit is staging its exhibition, March 3-8. It will be under the auspices of the Elks Lodge and will be held in the armory, which has a floor space of 10,000 sq. ft.

Shipping Space for Commercial Exports

WASHINGTON, Jan. 28—The British Government has allocated 10 per cent of all space on liners for commercial shipments. There are prospects for early release of additional space.

Detroit Hears Talk on Patents

Attorney for Standard Parts Co. Gives S. A. E. Comprehensive Summary of Laws

DETROIT, Jan. 25—Addressing the Detroit section of the Society of Automotive Engineers at their meeting last night, B. M. Kent, patent attorney for the Standard Parts Co., gave a comprehensive summary of the patent laws. He outlined the procedure necessary to secure a patent, and declared that a great deal of the trouble incurred by inventors and manufacturers in connection with the purchase of patents would be eliminated were Congress to grant the Patent Office at Washington a reasonable working appropriation instead of curtailing its budget to a minimum.

To this end, he suggested that the S. A. E. get behind a movement to secure for the Patent Office an individual appropriation, separate from that of the Department of the Interior, under whose jurisdiction it is conducted. He further declared that the Patent Office employees were insufficiently paid and that the Government was unable to secure expert legal and engineering advice because first class men would not work for the meager salaries offered.

In his address Mr. Kent dealt with the laws governing the granting of patents, commencing with the definition of a patent, the rights granted and their limitations in actual fact. He referred to the matters of prior patents, research, etc., and to the advantage of maintaining a file of the classes of patents relating to individual businesses or manufacturers, to the definition of a person eligible, by reason of his discovery of a new and useful art, etc., to have a patent granted him and to the formal manner in which application for such patent should be made.

Experiments on Flame Propagation

(*Continued from page* 248)

losses of heat, the combustion products are not in thermal equilibrium. Hopkinson showed, in 1906, that the temperature round the point of ignition may be several hundred degrees higher than the mean temperature (as reduced from the pressure), owing to adiabatic compression there, while near to the walls the temperature was much below the mean. Wheeler's pressures first rose rapidly, then kept constant for a short period, and finally dropped off owing to cooling. The period of constancy might be ascribed to a combustion in several stages and to exothermic secondary reactions between CO and steam; but the size of the vessel is of importance in this connection, and from Wheeler's experiments, some of which were made with a fan revolving in the mixture, the constancy period seems to be due rather to the equalization of temperature within the gaseous mass.

The time of first manifestation of pressure does not synchronize with the ignition moment. There is a time-lag (as Bairstow and Alexander had shown in 1905), and disregard of this fact may account for the high flame propagations stated by Le Chatelier. Wheeler observed that when the flame traveled at the rate of 28 cm. per second in a 6.3 per cent mixture, the time-lag (between ignition and first appearance of pressure) amounted to 0.18 second, and the maximum pressure developed within 0.348 second. That was in the 4-litre vessel. In the 16-litre vessel a flame of 15 cm. velocity took 0.423 second and 1.037 second for the two periods. Owing to this time-lag the flame will actually travel about 5 cm. in the small vessel and about 10 cm. in the large vessel before setting up any noticeable pressure, which is rather curious. The pressures were registered by means of a style fixed to a steel plate 2.6 cm. in thickness; ignition was by electric sparks.

—

Car Market Drained in 1918

(*Continued from page* 270)

472, of which 18,808 were delivered, 19,649 canceled, 7904 shipped overseas and but 15 remain to be delivered.

No motor trucks now overseas will be returned to this country, and but few of the trucks in the hands of the Army in this country will be offered for sale to the public, states the letter.

Following is the complete letter:

37 of 38 Jobbers Go Before Jury

Court Decides They Must Put in Defence—Case Against One Is Dismissed

NEW YORK, Jan. 28—Thirty-seven of the thirty-eight defendants in the suit brought by the Government against the Jobbers' Association will have to put in a defence and abide by the verdict of the jury. Judge Hand decided this to-day, and in doing so dismissed the case against the thirty-eighth, who is J. Stanley Clemence of Ballou & Wright.

The action of the court was a little surprising in view of the aspect of the situation up to this afternoon. It would not have been surprising if the cases against the entire thirty-eight had been dismissed. Yesterday saw the start of the taking of evidence before the jury.

Motorize New Zealand Post Office

WASHINGTON, Jan. 23—The Post and Telegraph Department of New Zealand has been allowed $48,665 for motor cars, motorcycles and bicycles for the use of that department. The Department of Mines has been allowed $65,698 to develop the mineral-oil industry of the country.

WAR INDUSTRIES BOARD
WASHINGTON

B. M. BARUCH
Chairman

From: Chief, Automotive Products Section.
To: Passenger Car and Motor Truck Manufacturers.
Subject: **Passenger Car and Motor Truck Data.**

1. Manufacturers' Reports submitted to this section supply information which will be of general interest.

2. TOTAL PASSENGER CAR PRODUCTION.

1917	1918
1,740,792	926,388

Sworn Reports received from the Passenger Car Manufacturers as of December 31, 1918, show that the Manufacturers had an aggregate of 15,545 finished Passenger Automobiles on hand. This represents only about three days normal production.

3. TOTAL MOTOR TRUCK PRODUCTION.

	1917	1918	Proposed 1919
For civilian use	109,865	164,264	
For military use	18,292	62,986	
	128,157	227,250	327,930

DISTRIBUTION OF PROPOSED PRODUCTION FOR 1919.

½ ton	9,300	2 tons	49,947	4 tons	1,149
¾ ton	30,043	2½ tons	10,063	5 tons	16,992
1 ton	138,738	3 tons	6,155	5½ tons	1,000
1½ tons	43,308	3½ tons	19,212	6 tons	1,069
				7½ tons	954

A sheet showing distribution in price retail has been previously mailed to all contributing manufacturers.

The large increase in production of Motor Trucks during 1918 for civilian use may be attributed in part to indirect war demand. It will be noted that the manufacturers in the aggregate propose to greatly increase production for 1919.

The proposed production figures for 1919 were supplied by the manufacturers after the signing of the Armistice.

4. SUMMARY OF U. S. GOVERNMENT MOTOR VEHICLES AS OF JAN, 1, 1919.

	Total Ordered	Total Delivered	Total Canceled	Balance Due	Shipped Overseas
Trucks	204,760	*98,000	78,081	28,679	54,343
Pass. cars	38,472	18,808	19,649	15	7,904

*Includes foreign purchases.

In December the Post Office Department made requisitions on the War Department under the Act of July 2, 1918, for 17,135 Motor Trucks, mostly from ¾ to 2-ton sizes.

5. From the best information available, it is the opinion of this section that none of the Motor Vehicles now overseas will be returned to this country and we have reason to believe that few, if any, of the Motor Vehicles in the hands of the military establishment in this country will be offered for sale to the public.—C. C. Hanch.

P.S.: Fnished trucks, including those for military use, in the hands of the manufacturers on December 31, 1918, represent only about fifteen days normal aggregate truck production.

Four Men Added to F. W. D. Staff

CLINTONVILLE, Jan. 25—Four men, all recently released from government service, have been added to the Four Wheel Drive Auto Co. organization. Lt. Willetts, who was chief instructor in the Motor Training School which the government formerly maintained at the F. W. D. plant, is now a member of the F. W. D. force and will be in charge of the instruction work connected with the plant.

F. A. Da Pron and Walter Hewitt have been added to the foreign sales department. Mr. Da Pron is a constructional engineer, who, for a number of years, was associated with the engineering firm of Reed & Stern, and who for the past year has been an engineer in the air service. He is a graduate of the Boston Technological Army School. Mr. Hewitt was an army instructor in gunnery.

A. B. Parks of Elmira, N. Y., has recently joined the sales force. For the past two years he has been connected with the Curtis Aeroplane Corp., Hammondsport, N. Y.

—

Two Ex-Army Men on Staff of Standard Parts Co.

CLEVELAND, Jan. 25—Lewis P. Kalb, formerly major of design, testing and specification work in the engineering division of the Motor Transport Corps, has joined the engineering staff of the Standard Parts Co. as assistant to the director of engineering. Before entering Government service he was chief engineer of the Kelly-Springfield Motor Truck Co., and previous to that was assistant truck engineer of the Pierce-Arrow Motor Car Co.

A. L. Watts, formerly captain in charge of the specification and record section of the engineering division of the Motor Transport Corps, will assume similar duties on the engineering staff of the Standard Parts Co. Before entering service in 1917 he was with the Pierce-Arrow Motor Car Co.

—

K. K. Hoagg has been appointed engineer in the sales department of the Hyatt Roller Bearing Co., Detroit. Mr. Hoagg, who has been connected with the company since 1912, left his position as assistant chief engineer to go into government service. For 11 months he was in the engineering division of the Motor Equipment Section of the Ordnance Department, stationed in Washington and Indianapolis. Previous to this he was for 7 months assistant to the manager of the Washington office of the S. A. E.

—

L. M. Baker has been engaged as special sales engineer for the Hyatt Roller Bearing Co., Detroit. At one time he was sales manager of the United Motors Service, Inc., and previous to that was western sales manager for the Standard Steel Spring Co., Detroit.

—

I. O. Taft, recently St. Louis zone superintendent for the Maxwell Motor Car Co., has been made manager of the Mississippi Valley territory with headquarters in St. Louis.

Men of the Industry

Changes in Personnel and Position

Edwin Denby a Major

DETROIT, Jan. 24—Edwin Denby, treasurer of the Denby Truck Co., former congressman, who enlisted in the marines as a private 20 months ago, has been advanced to the rank of major. He is stationed at Beaufort, S. C., having recently returned from several months of active service over-seas. He was a former president of the Detroit Board of Commerce.

—

Justin R. Weddell, Cleveland, will be advertising manager of the Firestone Tire Co., Akron, after Feb. 1, succeeding E. S. Babcock, recently resigned. Mr. Weddell comes from the Corday & Gross Co., where he is the sales manager.

—

J. L. Hibbard, foreign sales manager of the Cleveland Tractor Co., will sail on the Adriatic, Feb. 1, for a three months' business trip in Europe.

—

W. F. Winkelman has been appointed district manager of the Hupp Motor Car Corp. for the Philadelphia district. Mr. Winkelman was special representative of the Liberty Motor Car Co. and later of the J. E. Fields Co., as sales manager.

—

J. B. Siegfried, formerly general manager of the King Motor Car Co., Detroit, has been made sales manager and assistant general manager of the Auto Wheel Co., Lansing.

—

Major Mason P. Rumney will be out of the service Feb. 14, and will return to the Detroit Steel Products Co. as assistant general manager. He has been located in Washington with the Ordnance Department.

—

Major Howard Blood, executive officer of the Aeroplane Engineering Division, hitherto located at Dayton, has just been transferred from Dayton to Detroit and is now connected with the finance division. Major Blood is a member of the Blood Bros. Machine Co., Allegan, Mich.

—

F. R. Strunk, president of the Kansas City Foundry Co., Kansas City, has entered the Coleman Tractor Corp. as works manager and treasurer.

—

H. T. Melhuish, for some years advertising manager of the Fulton Motor Truck Co., Farmingdale, L. I., is going to Philadelphia to take charge of the Fulton office in that city, succeeding M. R. Sanborne, who goes to the Kansas City office. Mr. Melhuish is a brother of William Fulton Melhuish, president and founder of the Fulton Motor Truck Co.

General Lee Returns to England

WASHINGTON, Jan. 27—Brigadier-General Charles Frederick Lee, Royal Air Force, chief of the British Aviation Mission, sails for England Feb. 8, returning to command the Training Brigade, R. F. C. General Lee has been in the United States since Nov. 30, 1917.

—

Major George D. Wilcox, who commanded the Detroit district of the Motors Division of the Quartermaster Corps, has been honorably discharged and returned to the Commerce Motor Car Co., Detroit, as director of sales and advertising.

—

A. C. Miller has resumed his duties as vice-president of the Miller-Judd Co., Liberty distributers, Detroit, after serving one year in the navy.

—

J. K. Gould, formerly advertising manager for the Ford Motor Car Co. of Canada, has been discharged from the army and has rejoined the staff of the Campbell-Ewald Co., Detroit.

—

E. V. Sidwell, former assistant manager to Edward D. Bland, manager of the Fulton Motor Truck Co. of Michigan, has been made successor to Mr. Bland, who died some time ago of influenza.

—

Glen T. Purdy, who has just returned from active service, has gone back to the King Motor Car Co., where he has been appointed assistant purchasing agent.

—

C. A. Watson, formerly a minister, has been appointed sales manager of the Four-Drive Tractor Co., Big Rapids. While pastor at Grand Ledge, Mich., Mr. Watson was distributer for the Studebaker car and also operated a machine-shop. Prior to that time, he sold Underwood typewriters and National biscuits. He was also an auditor and cashier for the U. S. Steel Co. in the Minnesota mining district. He has been a clergyman for 10 years.

—

B. F. Wulff has been appointed general sales manager for the International India Rubber Co., South Bend. He was formerly sales manager for the Century-Plainfield Tire Co., and prior to that was connected with the Kelly-Springfield Tire Co. at Chicago.

—

W. T. Horton, Jr., formerly in charge of the executive branch of the Engineering Division, Motor Transport Corps, has been appointed chief engineer of the Russel Motor Axle Co., North Detroit.

—

Sales Representative of F. W. D. Co. Dies Suddenly

W. N. Durphy, sales representative of the Four Wheel Drive Auto Co. in the Des Moines territory, died suddenly at the home of the F. W. D. dealer in Des Moines on Jan. 15. Ptomaine poisoning is supposed to be the cause of his death.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Republic to Put Out New ¾-Ton Truck

ALMA, MICH, Jan. 27—Twelve leading distributers of the Republic Motor Truck Co. met at the plant last week for an informal conference to discuss sales plans for the coming year. When the conference ended the distributers had organized the Republic Distributers' Association, chosen directors and elected officers.

The company sought the advice of the dealers relative to the proposed manufacture of a new model truck, a ¾-ton machine, and what the distributers immediately termed a "speed wagon." The matter of price-rating and specifications were taken up and led to much constructive debate.

The distributers inspected the two improved truck models, known as models 19 and 20. Both of these machines are practically the same as last season, with detail improvements. Model 19 is a 2½-ton truck. Model 20 is a 3½-ton machine. The five other standard Republic models are being manufactured as usual.

The company, while running below capacity, is completing 1000 jobs a month and will increase this as soon as the material situation clears up. The last war contract will be finished by the end of February. The contract was a big one for the manufacture of the "Class B" truck.

The Republic company is organizing agencies in Sweden, Norway, Japan, India, China, Australia, New Zealand and South America.

Transport Puts New 2-Ton Model on Market

MT. PLEASANT, MICH., Jan. 28—The Transport Motor Truck Co. is now entering production. The new truck is 2-ton capacity with a Clark internal gear drive, Continental engine, Eisemann magneto, duplex centrifugal governor, Stromberg carbureter, Fuller clutch and transmission mounted in the unit power plant, Columbia front axle, Jacox steering gear and Prudden wheels. The truck is mounted on a pressed steel frame.

The wheelbase is 150 in. and the truck is built in chassis form equipped with tools, jack, oil lamp, tail lamp, motometer and odometer. The truck has been on the road for several months in experimental form, and was intended to be in production by July, but owing to the material situation was held until the present time, when the production schedule has now gone into effect. The price is $2,585.

King Cars Ready March 1

DETROIT, Jan. 25—Reconstruction is the big problem before the King Motor Car Co. This company, which was operating 90 per cent on war contracts, was hit hard by the sudden cancellation of the contract work. The company is now rapidly getting back into passenger car production again. Assembly work is in progress, but completed cars will not be turned out before March 1. At that time production will start with five cars daily.

General Motors' Subsidiary to Finance Dealers

NEW YORK, Jan. 27—A subsidiary company incorporated under New York State laws and called the General Motor Acceptance Corp. has been formed by the General Motors Corp. to assist car and truck dealers in financing their purchases. Paid in capital is $2,000,000 and surplus is $500,000. The stock was subscribed by W. C. Durant and his associates. Paul Fitzpatrick, formerly vice-president and director of the Continental Guaranty Corp., is vice-president and general manager of the new concern. J. A. Haskell is president and Alfred H. Swayne is vice-president and financial manager.

Although the primary purpose of the new company is to finance automotive transactions, it is understood that the business in acceptances will be carried on in other directions, probably in connection with the various du Pont enterprises.

Ford Reopens Omaha Branch

OMAHA, Jan. 28—The Omaha branch of the Ford Motor Co. has resumed operations after being closed since last summer for an indefinite period because of war conditions.

The body department was the first to open, and when about 600 bodies have been completed the assembling department will start, which should be within a week. It is stated that the number of employees will be about 500, the same as were used before the closing, and that all former employees who so desire may have their old jobs back. Charles L. Gould remains in charge as branch manager.

Harroun Back to Peace Time Production

DETROIT, Jan. 28—The Harroun Motors Corp., Wayne, Mich., will complete its war contract calling for the manufacture of 155 mm. shells by Feb. 1 and is getting back to a peace time production schedule. The company will run 100 cars monthly in January and February and will increase this production in March if materials come easily. Rumors that Ray Harroun, vice-president and chief engineer, had left the organization, are unfounded.

Receivership for Hurlburt

NEW YORK, Jan. 27—William B. Hurlburt has been appointed receiver for the Hurlburt Motor Truck Co. by the United States District Court, under bond of $25,000. The company claims assets of about $500,000 and liabilities of about the same amount.

Willys-Overland Producing 300 Cars Per Day

TOLEDO, Jan. 27—The Willys-Overland factory has increased production to a point where 300 cars per day are being turned out. January schedules call for from 6000 to 6500 cars, and it is expected that in early spring the monthly figures will run at least twice this number, or at a rate which will insure a year's output at least as high as in 1916, the last normal year. Shipments last year were approximately 82,000 cars. At the tractor end of the business, it is stated that the Moline Plow Co. branch is building from sixty to seventy-five machines per day. This figure will be increased to 125 as soon as the supply of raw material is sufficient. It is expected that 25,000 Moline tractors will be built this year.

Dodge 6-Cylinder Reo Rumor

LANSING, Jan. 27—Officials of the Reo Motor Car Co. do not throw additional light on the rumor current in automotive circles that the Reo company is making and will place a 6-cylinder car on the market June 1. They declare the rumor is "stock-market talk," but otherwise will neither confirm nor deny it.

The Reo Co. has finished its government tractor contract. While not running at normal capacity at present, the plant is now turning out 100 cars and trucks daily. The company expects its domestic trade to keep it too busy to cater extensively to the foreign market.

Studebaker Averaging 60 Cars a Day

SOUTH BEND, Jan. 27—Indications are that some of the manufacturers of motor cars may get back into production earlier than they anticipated. Word from the Studebaker Automobile Co. says that it has been able to get into after-war production thirty days ahead of schedule. At present, this concern is averaging sixty cars per day, and this figure will be increased 100 per cent by March 1. The Studebaker company expects to produce approximately 6500 cars during the first quarter.

Pearce Making 100 Tires a Day

ASHTABULA, Jan. 28—The Pearce Tire & Rubber Co. is now in full operation in its new plant. Officials say that within 60 days their production will exceed 100 tires daily. This will be increased gradually until the full capacity of the factory, 500 tires a day, is reached.

Franklin Coming Back to Normal Production

SYRACUSE, Jan. 27—The Franklin Automobile Co. is rapidly getting back to its normal manufacturing basis. Although the week following the signing of the armistice the company turned out only four cars, the production schedule for January calls for 26 cars a day. By May it will be increased to 35, by September 40, and by the end of the year it is expected that the company will produce 50 cars daily.

WASHINGTON, Jan. 25—Following is a list of contracts made by the office of the Director of Purchase for the Bureau of Aircraft Production:

Wright Martin Aircraft Corp., New Brunswick, 13 Hispano Suiza type "E" or "I" built from rejected parts, $26,000.
Curtiss Aeroplane & Motor Corp., Buffalo, spare parts for JN4-D planes, $14.97.
Corbin Screw Corp., New Britain, miscellaneous bolts, screws, etc., $292.43.
Wright Martin Aircraft Corp., Van Dyke negatives—Hispano Suiza—1 set and bill of material, $40.
Wright Martin Aircraft Corp., New Brunswick, 6 items of special tools for Hispano Suiza type A engine, $87.90.
Wright Martin Aircraft Corp., New Brunswick, 10 No. 11894 lower half water pumps (Hispano Suiza "I" engine), $57.60.
Wright Martin Aircraft Corp., New Brunswick, repairs for Hispano Suiza engine, $1.20.
Wright Martin Aircraft Corp., New Brunswick, 36 No. 9642 Magneto gears for Hispano Suiza engines, $331.70.
Wright Martin Aircraft Corp., New Brunswick, 500 piston pin set screws, $70.
Zenith Carburetor Co., Detroit, spares for Zenith Carb., $154.
Wright Martin Aircraft Corp., New Brunswick, 8 No. 11988 pistons for Hispano Suiza type "E" engines, $120.56.
Wright Martin Aircraft Corp., New Brunswick, 100,000 No. 11169 steel cotter pins, $33.
Barber & Ross, Washington, D. C., 4 kegs nails, $17.40.
Bay State Tap & Die Co., Mansfield, Mass., 29 chasers, screw plates, and wrenches, $39.63.
John A. Roebling Son's Co., Trenton, 150 pieces balloon cable, 30 feet long, $513.

826 Farm Tractors in France

(Continued from page 271)

cultural knowledge, to enter into the tractor field.

Among other automobile firms who have announced their intention of entering the agricultural field, are Saurer, a Swiss firm, with a big factory in the suburbs of Paris; Panhard & Levasseur, one of the oldest automobile firms in the world; Renault, who possesses the biggest automobile factory in France, and Paris General Omnibus Co., which is now a producing as well as an operating concern.

In Italy, Fiat, which possesses the largest factory in Europe, has already produced an agricultural tractor and intends to considerably develop this field.

In connection with factory developments, announcement is made by Renault that in addition to passenger automobiles and tractors, he has decided to manufacture shaftings, pulleys, bearings, etc., for machine shops, as well as standardized gear sets giving four or eight speeds, to be installed on all types of machine tools enabling them to have a single driving pulley or for use with electric drive. Renault will also manufacture drills, taps and dies, wrenches and other small tools.

Although at the present moment France possesses very few tractors, the possibilities in this direction are immense. Practically the whole of the automobile service of the French Army has been handled by elderly men drawn from the agricultural classes.

France possessed 95,000 trucks and passenger cars in army service. Estimating two men per vehicle, and the regulations call for two drivers on every truck, this gives a total of 190,000 men who have had from one to four years' truck-driving experience. The artillery service has also made an extensive use of automobiles independently of the general automobile service of the army.

Thus, the total is certainly not less than 200,000 men, of which the great majority are connected with farming, who have had a thorough automobile training. All these men, on returning to civilian life, will not only be capable of taking charge of tractors, but will be anxious to use them in preference to horses, even if horses are available.

Contracts

N. A. C. C. Truck Meeting Papers

NEW YORK, Jan. 30—Problems of the greatest importance to the motor truck industry will receive consideration at the Motor Truck Manufacturers' convention, to be held at the headquarters of National Automobile Chamber of Commerce on Tuesday, Feb 11, which is during the week of the Motor Truck Show in New York. Following are the topics:

Present Status of the Motor Truck Business—By C. A. Wales, Truck Sales Manager, Locomobile Co. of America.
The Need for Federal Highway Policies and a Federal Highway Commission—By E. J. Mehren, Editor, *Engineering News-Record*.
What Should Be the Limitation of Weights, Speeds and License Fees on Motor Trucks in the Proposed Uniform Vehicle Law—By George M. Graham, General Sales Manager, Pierce-Arrow Motor Car.
Disposition of Surplus Military Trucks Here and Abroad—By Col. Fred Glover, Quartermaster's Department, U. S. Army.
What New Standardization Can Be Done on Motor Trucks?—By David C. Fenner, International Motor Co.
What the Post Office Will Require in Motor Trucks During 1919—By James I. Blakeslee, Fourth Assistant Postmaster General, Washington.
What Are the Opportunities for Motor Truck Sales in Europe?—By David Beecroft, Directing Editor, *Automotive Industries*.
Can We Improve the Present Standard Service and Standard Parts Policies and Guarantees?—By E. J. Herbig, Sales Manager, Service Motor Truck Company.

Vesper Again Heads Dealers

CHICAGO, Jan. 29—F. W. A. Vesper of St. Louis, was re-elected president of the National Automobile Dealers' Association at the close of its 2-day annual convention here to-day. One of the resolutions pledged the organization to complete co-operation with the manufacturers in the solution of reconstruction problems.

Plans were formulated for campaigns in all sections through local and state associations for the promotion of good roads. The association will take up national road aid.

The necessity for better business methods for the motor car dealer was urged by Henry Paulman, Chicago, who talked from his seventeen years of experience in the automobile business as a dealer. Why the dealer should be a factor in good roads work was told by Pyke Johnson, good roads representative of the N. A. D. A. in Washington.

Life membership was voted to W. G. Tennant, Chicago, for work in the early days of the association's development; an engrossed resolution was presented to George W. Brown, Milwaukee, for having conceived the thought which led to the formation of the organization. A silver loving cup was presented to President Vesper for his work in building the association during the period of the war. This afternoon dealers from all over made four-minute talks on business subjects. The officers follow:

President, F. W. A. Vesper, St. Louis; first vice-president, E. W. Steinhart, Indianapolis; second vice-president, Harry D. Austin, Seattle; treasurer, Thomas J. Hay, Chicago; re-elected directors, G. B. Kimball, Boston; A. E. Maltby, Philadelphia; A. E. Mitzel, Canton; George D. McCutcheon, Atlanta; J. A. Graham, Minneapolis; H. L. Robertson, Houston; P. E. Chamberlain, Denver; W. J. Brace, Kansas City; P. E. Greer, San Francisco.

The convention closed with a banquet this evening. Addresses yesterday were by George M. Graham, sales manager of the Pierce-Arrow Motor Co., on "Getting Back to Normal"; John N. Willys, president of the Willys-Overland Co., on "The Automobile Business; Past, Present and Future"; Edward S. Jordon, president of the Jordon Motor Co., on "The Automobile Dealers' Problems in Sales and Advertising." The report of the secretary gave the membership as 4475.

WASHINGTON, Jan. 25—The following orders have been placed by the Bureau of Aircraft Production:

Standard Aircraft Corp., Elizabeth, spare parts for Dh-4 planes, $36.96.
Washington Loose Leaf Co., Washington, steel bands for Proudfit binder (12), $1.80.
Western Electric Co., New York, 1,500 feet lamp cord, $111.
Barber & Ross, Washington, 24 U blocks, $66.
Starr Piano Co., Richmond, Ind., 300 boxwood toggles, $48.
James William Bryan Press, Washington, book, "Who's Who in Bureau of Aircraft Production," $7.50.
Wright Martin Aircraft Corp., New Brunswick, Hispano Suiza A-150 horsepower, engine spares, $39.49.
Willys-Overland Co., Toledo, 40 pieces, No. 3363 studs, $14.80.

Contracts Completed

WASHINGTON, Jan. 25—The Holt Mfg. Co., Peoria, has completed a supplemental tank for the Ordnance Department at a cost of $22,000.

The Cleveland Tractor Co., Cleveland, has completed a tractor and spare parts for the Ordnance Department at a cost of $1,405.07.

Bieler to Make "Argonne" Cars

NEW YORK, Jan. 30—Otto R. Bieler has formed the Automotive Engineering Co., with headquarters at - East Forty-second Street, and will market a 6-cylinder car which will be manufacturered for him by the Jersey City Machine Co., Jersey City. It is planned to produce 100 to 150 cars this year and to sell them for about $3,500. The car will be styled "Argonne" and will be supplied in two- and four-passenger capacities. It will have a high speed engine with a four-speed gearset, 120 in. wheelbase and 32 x 4 tires; bodies will be custom built throughout.

Automotive Industry of Great Aid in Winning the War

Took On Military Works, Exclusive of Trucks, Amounting to $1,000,000,000 —Curtailment of Car Production Held to Have Been Necessary

WASHINGTON, Jan. 24—That the War Industries Board policy of curtailment of peace industries was proper and necessary and that the automobile industry thoroughly co-operated in a most commendable manner with the War Industries Board is the text of an outline of the activities of the Automotive Products Section by C. C. Hanch, Chief of the section.

The outline, made public to-day, states among other things that during the last 6 months of 1918, when reduction of passenger cars was limited to 50 per cent of 1917, manufacturers requested permits for production of 295,468 cars, which was allowed. Of these, 186,178 cars were produced during the third quarter, leaving 109,290 to be produced during the last half of the year.

This total of 295,468 cars is approximately 50 per cent of the production during the same period of 1917, not counting Fords. The Ford company made no request for permission to manufacture passenger cars in the last half of 1918.

That the automobile industry "was most valuable to the war machine and took on military works exclusively of motor trucks to the extent of $1,000,000,000," is a statement in Mr. Hanch's report. "The industry has been of incalculable aid to the successful prosecution of the war," testifies Mr. Hanch.

Control of the industry by the War Industries Board and its curtailment insofar as passenger car manufacture is concerned was found, according to the statement, to be "necessary due to the drafting of millions of men and the resulting shortage of labor, transportation, fuel, etc.," which made it "obvious that non-war industries could not reasonably expect to continue normal activities." Following is the complete account of the activities of the Automotive Products Section during the war and up to the time of the cessation of its activities as told by Mr. Hanch:

Work of the Automotive Products Section

By C. C. Hanch

Chief Automotive Products Section

THE Automotive Transport Committee, a co-operative committee of the Advisory Commission of the Council of National Defense, was organized June 4, 1917. The committee was created as a channel of communication between the automotive industries and the governmental departments and continued under the same jurisdiction until September 4, 1917, at which time the committee was reorganized and placed under the War Industries Board, and was thereafter known as the Automotive Products Section.

At the time the Automotive Transport Committee was organized Charles Clifton was made chairman. K. W. Zimmerschied served as vice-president from June 4, 1917, to September 4, 1917. H. L. Horning served as Chief of the Automotive Products Section from September 4, 1917, to June 19, 1918, and C. C. Hanch served as Chief from June 20, 1918, until the Section disbanded. The final form of organization of the Section is indicated in the chart.

The first report of the Automotive Transport Committee is contained in the first annual report of the Council of National Defense at page 89. Report for the fiscal year June 30, 1917, to June 30, 1918, is contained in the second annual report of the Council of National Defense.

Composition of Committee

The Committee or Section as originally constituted consisted entirely of representatives of the automotive industry. When the committee was reorganized in September, 1917, an army representative and a member of the War Industries Board were added. After the functions of the War Industries Board were defined by the President's letter of March 4, 1918, the form of organization of the Automotive Products Section was further modified so that it consisted entirely of representatives of six Governmental departments presided over by the Chief and assisted by the staff of the Section.

Regular meetings of the Section were held monthly and conferences were held with the different Section representatives at frequent intervals. The procedure of the Section in performing its functions was determined at the regular meetings. Automotive subjects generally were discussed and particular attention was given to such matters as clearances, interferences, facilities and allocations.

Jurisdiction of Products Section

The Automotive Products Section had jurisdiction over the following line of automotive material on the clearance list of the War Industries Board (which list and the regulations thereunder governed the purchasing departments of the Government in the procurement of these commodities), including combustion engines and their application, their accessories, parts, etc., with the exception of agricultural tractors and stationary and portable engines for agricultural and other purposes:

Bicycles	Armored cars
Motorcycles,	Military tractors
Motorcycle side cars	Military tanks
Motor cars	Airplane engines
Motor ambulances	Airplanes
Motor trucks	Marine gas engines
Motor truck bodies	Automotive accessories and parts
Motor truck tractors	
Motor truck trailers	

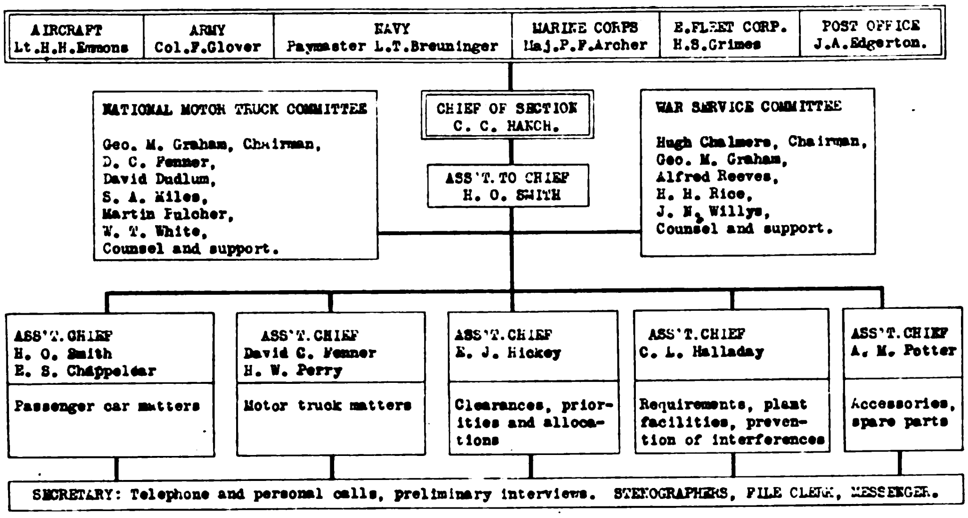
Purchases of automotive equipment or materials covered by the above list which the Allied Governments desired to make in the United States through the Allied Purchasing Commission were sent to the Automotive Products Section for recommendation before purchases were made.

Advised With Priorities Division

The Automotive Products Section advised and made recommendations to the Priorities Division in reference to individual applications for priority certificates filed by subcontractors on United States and Allied Government purchases of automotive equipment and materials, and also gave advice in reference to applications filed by others for materials for commercial purposes.

Among other functions of the Section actually being performed at the close of the war were the following: Granting clearances on purchases of automotive equipment by the various departments of the United States Government and tho Allies. Recommendation of sources of supply where there was a shortage of facilities and the allocation of orders where there was interference or shortage of capacity. Personal contact was constantly maintained by a member of the Section staff with all Governmental departments represented on the Section, thereby providing intimate knowledge of all requirements and facilities for their execution. Help was extended the Governmental agencies in classifying requirements and the conversion or arrangement of same to meet existing facilities where possible. This called for a close study of and a calculation of aggregate facilities. These reports were placed in the hands of departments concerned and were of assistance in the final balancing of requirements and facilities. Co-operation with the various procurement divisions was maintained and lists of possible sources of supply were edited or compiled and additional sources suggested when needed. Request for increased facilities for war purposes were examined and recommendations submitted. Applications for stock and bond sales, increases in capitalization and creation of new companies referred to the Section by the representative of the Capital Issues Committee were examined and recommendations submitted. Engineering and production problems as relating to alternate selection of

Chart of Organization of the Automotive Products Section



materials or ways and means, were solved informally with Governmental departments which represented them. Suggestions were made to automotive manufacturers as to how their facilities could best be used and their representatives were given introductions to the proper officials negotiating the work.

The most interesting and difficult problems were encountered by the Section in connection with the administration of the regulatory arrangements made between the War Industries Board and the automotive industries such as passenger automobiles, motor trucks, bicycles, motorcycles, ball and roller bearings.

The automobile and motor truck industry was in a remarkably active condition at the beginning of and during the first half of 1918. During the calendar year 1917 there were produced 1,740,792 passenger automobiles and 128,157 motor trucks, the aggregate sales value of which at wholesale prices amounted to $1,238 979,891. There were approximately 300,000 men employed by the automobile and motor truck manufacturers and 320,000 men employed by the accessory and component parts makers in 1917. High grade steel and other metals were being consumed by the automobile and motor truck industry at the rate of 2,000,000 tons per annum. Shortage of material and labor had began to be felt in the fall of 1917 and were becoming acute during the first half of 1918. With millions of men being drafted, or enlisted, and taken from the ranks of productive labor with the resulting shortage of labor, transportation, fuel, etc., it was obvious that non-war industries could not reasonably expect to continue normal activities. Under these circumstances if the automotive industry had attempted to operate with continued normal activity on civilian business it would have either hampered itself and other industries or the Government in the prosecution of the war.

Production Reduced 30 Per Cent

Early in March, 1918, representatives of the automobile industry were called into conference by the War Industries Board and after full discussion it was agreed that a 30% reduction in the current manufacturing schedules of passenger car makers would not cause disturbance in the automobile industry and would help solve the problems of transportation and raw materials.

Upon request the manufacturers proceeded with this reduction, effective March 1, 1918, and continuing up to the end of the fiscal year, ending June 30, 1918, and not later than July 31, 1918.

Representatives of the motor truck industry made an interesting and forceful presentation of the important needs of their industry with the result that early in August, 1918, the War Industries Board reached the decision that "motor trucks, insofar as they are used directly or indirectly for war purposes, are war essentials and their production for such purpose must be facilitated, and further, insofar as motor trucks are employed in civilian industries for essential uses, they constitute an important transportation medium and any curtailment of such uses should be avoided as far as practicable." The Board further defined its attitude in a special Circular No. 11 addressed to manufacturers of motor trucks in which the Priorities Commissioner stated that "it appears, however, that there exist in this industry, as in many others, factors of non-essentiality which must, as a war measure, be removed." As a practical means of eliminating this degree of non-essentiality, a pledge was framed by the War Industries Board to be given by all truck manufacturers and their distributers and dealers before any preference could be accorded them in procuring materials.

Issues "Industry Priority Certificate"

Instead of issuing individual priority certificates to motor truck manufacturers for each purchase of parts and materials the Automotive Products Section recommended that an "Industry Priority Certificate" be issued to each manufacturer under which the manufacturer could order his materials in the usual way by attaching the prescribed form of affidavit to his purchase orders. This plan facilitated the procurement of materials by the manufacturers and avoided an enormous amount of clerical work by the War Industries Board and the manufacturers.

The pledge bound the manufacturers and dealers, among other things, to sell no motor trucks except for essential uses, to sell no user an unnecessary number of trucks even for essential uses, to discourage the purchase of any motor truck to replace a usable truck already in service, to give maximum encouragement to the repair of trucks, and to make monthly reports to the Automotive Products Section. It was expected that the effect of this pledge would be to reduce the output of trucks to some extent, not because the transportation facilities and economies afforded by motor trucks were considered unimportant or undesirable, but solely because of the shortage of labor, steel and other materials entering into the construction and use of trucks.

To conserve iron and steel without working undue hardships on some truck manufacturers as compared with others, the supply of these materials was allocated among all on the basis of past production of trucks by each company during a normal production period. Industry Priority Certificates issued to the manufacturers permitted them to proceed during the last half of 1918 at the average rate during the period of the 18 months ending June 30, 1918. Greatly expanded production schedules of some of the newer companies were necessarily curtailed as a war measure and new enterprises involving the use of material, labor and capital were discouraged as unnecessary for the reason that existing facilities were ample to produce all motor trucks required for essential uses or for which steel could properly be furnished. There was no restriction whatever on the production of trucks for military purposes—on the contrary, every effort was made to expedite the manufacture of trucks ordered by the United States Government and the Allies.

The manufacturers of passenger automobiles were again called into conference by the War Industries Board in pursuance of the curtailment agreement made in March, 1918, and after full consideration of all phases of the situation a further understanding was reached between the automobile industry and the War Industries Board which was expressed in a letter written Aug. 24, 1918, by the War Industries Board to the National Automobile Chamber of Commerce. It appeared that the stocks of raw materials and semi-finished goods in the hands of the manufacturers of passenger automobiles were large and greatly unbalanced and that they could not be liquidated until they had been matched up with other materials necessary to manufacture the completed cars.

Assists in Liquidation of Stock on Hand

It was becoming obvious that under the priority preference being given to the production of direct and indirect war needs, the withdrawal by the Government of labor from establishments then producing materials for the Government and the automobile industry and the increasing difficulties of securing transportation and fuel, manufacturers of passenger automobiles would have been unable on their own account to secure materials to match up their unbalanced inventories and continue production upon a basis which would support their organizations.

Under these circumstances the conclusion was reached that it was in the public interest as well as in the interest of the automobile industry that it be assisted as far as practicable without interfering with the war program in the liquidation of its stocks then on hand. To that end it was decided to accord a degree of preference to each manufacturer of passenger automobiles who would subscribe to a pledge, the essence of which was as follows: "That its production of passenger automobiles and all repair parts therefor, shall not, for the six months ending with Dec. 31, 1918, exceed 25 per cent of its production for the calendar year 1917." This pledge meant that passenger automobile manufacturers were permitted to operate on a 50 per cent basis during the last six months of 1918, as compared with the year 1917. It was believed that this basis

would support the organizations of the manufacturers until they could utilize their facilities as far as practicable for the production of direct and indirect war requirements which they were urged to do. The attention of the manufacturers was called to the urgent war requirements for iron and steel and the uncertainty of being able to procure materials for the manufacture of passenger automobiles after Jan. 1, 1919, if the war continued.

The administration of the arrangement made with passenger automobile manufacturers was assigned to the Automotive Products Section, which developed the following procedure:

Procedure of the Section

A. Submission by the manufacturers of sworn inventory figures approximately as of July 1, 1918, showing value of material on hand and value of material required to balance the inventory; also tonnage of principal classes of steel and the number of principal assembled units on hand and tonnage of principal classes of steel and number of principal assembled units required to balance up the material on hand.

B. A statement of the number of finished cars which could be built from the inventory when balanced and the time required to complete them.

C. Submision of sworn production figures separately for the years 1916, 1917 and the first half of 1918.

Upon receipt of the foregoing information the Automotive Products Section certified to the Director of Steel Supply the requirements of each manufacturer for the principal classes of steel in tons and principal assembled units to balance up inventory on hand and produce the passenger automobiles allotted under the manufacturer's pledge. Each manufacturer was then notified that he was privileged to build a specified number of cars and that materials therefor might be obtained by filing in triplicate with the Director of Steel Supply applications for "Permit to Purchase." The manufacturer's copy of application for "Permit to Purchase" when granted constituted the necessary authority for the supplier to fill the manufacturer's order.

In case the supplier or parts manufacturer was not the original source of supply of the raw materials required, such supplier or parts manufacturer made application for "Permit to Purchase" in like manner and on the same form as required from the maker of passenger automobiles. Materials required for the manufacture of essential repair parts both by the makers of passenger automobiles and by their suppliers were obtained on "Permits to Purchase" when endorsed by the Automotive Products Section and approved by the Director of Steel Supply.

Certified Manufacturers' Requirements

Under this procedure the Automotive Products Section certified to the Steel Division the requirements of 95 manufacturers covering the production of 295,468 passenger cars during the last half of 1918.

The application for "Permit to Purchase" carried an undefined degree of preference, which was sufficiently flexible to meet the needs of the manufacturers and the routine was simpler and more rapid in its results than under the usual procedure of application for individual priority certificates. The equitable control of the industry, under the arrangements made with it, was accomplished by monthly reports of operation submitted by the manufacturers carrying the following information:

1. Number of finished cars on hand at beginning of month.
2. Number of cars produced during the month.
3. Number of cars delivered to United States Government during month.
4. Number of cars delivered to Allied Governments during month.
5. Number of cars delivered for civilian use during month.

Of the total productive allotment of 295,468 cars for six months as certified to the Director of Steel Supply by the Automotive Products Section, 186,178 cars were produced during the third quarter, leaving 109,290 cars to be produced during the last quarter of the year.

On Nov. 11, 1918, the date when the armistice was signed, a circular was issued which removed 50 per cent of the restrictions which had been imposed on the production of passenger automobiles.

Material requirements for parts and accessories were handled by the section through "Permits to Purchase," and this arrangement made it possible to obtain materials to keep in operation the passenger cars in use. No definite ruling was made as to what allowance of material could be made to manufacturers of automobile repair parts, replacement parts or accessories. In the absence of any such ruling the manufacturers were advised to make application for "Permit to Purchase" and each application was considered on its merits and either approved for the quantity of material which conditions warranted and sent to the Director of Steel Supply, or disapproved.

Permits Governed by Production

The quantity of material allowed under applications for "Permit to Purchase" was in most instances governed by the applicant's previous output of production. The section usually recommended that the applicant be permitted to purchase sufficient materials to carry him through a period of from 60 to 90 days at a production rate of about 50 per cent of normal.

In cases where the article which the applicant desired to produce was of such a character as to be unnecessary for repair, maintenance or upkeep of existing automotive equipment and in cases where the applicant had sufficient material on hand to meet his requirements for a considerable period on a conservative production basis, the application was disapproved. Disapproval was also given applications for permit to purchase where the material desired was for the purpose of producing new or untried devices or alleged improvements which were not supported by reliable endorsement. In all cases the replacement of entire assemblies where the simple repair, replacement or readjustment of an individual part would serve to restore the machine to normal running condition was vigorously discouraged.

In short, all necessary steps were taken to convert the automotive industry from peace time activities to the most effective condition and efficient form of organization for the prosecution of the war and prompt reconversion after the end of hostilities. Too much credit cannot be given the automotive industry for the effective and patriotic work it has done in the war emergency.

275,000 Vehicles for Allies

Before the United States entered the war American truck manufacturers had furnished more than 40,000 motor trucks to England, France and Russia. After entering the war and prior to the signing of the armistice, motor truck and passenger car manufacturers had contracted to furnish the American army and navy about 35,000 passenger cars and 200,000 trucks and ambulances. About half of this number had been completed when the armistice was signed, of which 54,343 trucks had been floated for use of the American Expeditionary Forces. About 15,000 trucks were in use by the military establishment in the United States. More than 30 manufacturers supplied trucks to the military establishment. In response to the needs of the Government many manufacturers gave up all or most of their civilian trade in order to furnish trucks and automotive equipment to the army and navy.

The motor vehicle industry supplied the engineering talent, mechanical genius and facilities to carry through the greater part of the airplane program. Automobile companies had accepted orders for about 70,000 Liberty airplane engines before the war ended and at that time the production of engines had reached a rate of several thousand per month.

In this connection it should not be assumed that automobile and motor truck manufacturers confined themselves to the production of automotive equipment. Among other articles manufactured by passenger car and truck makers, in addition to passenger cars, motor trucks, airplane engines and parts, were the following:

Military Production of the Industry

Eagle submarine chasers	Artillery wheels
Tractors	Litters
Kitchen and other trailers	75 mm. and 155 mm. shells
Ambulance bodies	Depth bombs
Tanks	Airplane bombs
Gun carriages	Mine anchors
Gun recoil mechanisms	Grenades
Naval gun mounts	Shell adapters
Escort wagons	Torpedo directors
Water carts	Balloon winches
	And many other articles.

The highly trained mechanical knowledge and skill of the automotive industry was most valuable to the war machine, and the great capacity and modern machinery of the automobile plants fitted them better than most industries to execute the varying requirements of modern warfare. The automotive industry, including passenger car makers, took on military work exclusive of motor trucks to the extent of approximately $1,000,000,000.

It is highly to the credit of the men in the industry that those orders were taken at prices that afforded a relatively small percentage of profit with the object of rendering patriotic service to the country. Without exception, motor truck and passenger car manufacturers have exhibited a willing spirit of co-operaton with the War Industries Board in taking on war work, accepting its decisions affecting production of civilian trucks and passenger cars and in faithfully observing the pledges given regarding the use of materials and the restrictions of sales to essential uses.

As a whole, the industry has been of incalculable aid to the successful prosecution of the war.

Clark Equipment in Movies at Shows

BUCHANAN, Mich., Jan. 25—The Clark Equipment Co. is showing at the Chicago and New York automobile and truck shows a series of industrial films portraying the actual processes of manufacture in its plants. The films are being shown at the Hotel LaSalle in Chicago and the Waldorf-Astoria in New York as supplementary exhibits to the disc wheels and axles displayed at the regular shows. Complimentary tickets of admission will be mailed on application to the company, or may be obtained at the booth at the shows.

Indian Service Wants Car

WASHINGTON, Jan. 25—The United States Indian Service, Department of the Interior, asks for bids on one light weight 5-passenger touring car from manufacturers or regular dealers. Cut and description of car, equipment and date of delivery, together with delivery point, are to be submitted with the bid, which should be made to the United States Indian Ware House, 308 South Green Street, any time up to 10 a. m. Jan. 30.

Tractors Needed in Greece

WASHINGTON, Jan. 25—Greece is suffering from a shortage of agricultural machinery and particularly tractors. The government has just placed an order with an American company for 15 motor plows and 200 tractors fully equipped with plow, harrow, hoe and thresher. Greece is cultivating more than 1,300,000 hectares (1 hectare equals 2.47 acres) of land, and has at its disposal only 160 thrashers, 1,200 reapers, 100,000 plows and no tractors.

Motorine, Gasoline Substitute in Greece

WASHINGTON, Jan. 25—Due to a shortage of petroleum in Greecce, a substitute called "motorine" has been produced, which comprises spirits of turpentine twice refined, or a mixture of alcohol and turpentine in proportions of 85 to 15. It has been very successfully used in Diesel petroleum engines.

Weather Bureau Helps Keep Roads Open

WASHINGTON, Jan. 27—Help given last winter by the Weather Bureau in keeping the Lincoln Highway open between Harrisburg and Pittsburgh, during the season of heavy snows, is being arranged this year for portions of New York and New Jersey.

The Bureau has called the attention of

Calendar

ENGINEERING

S. A. E. Meetings

Jan. 30 — Chicago—"Home-coming" Supper, Morrison Hotel.

Feb. 3—New York—Banquet in honor of Capt. E. V. Rickenbacker, Waldorf-Astoria, Contest Board, American Automobile Association.

Feb. 4-6—New York. Winter Meeting. Society of Automotive Engineers, Engineering Societies' Building.

Feb. 5—Minneapolis Section, S. A. E. — Hotel Radisson. "Radiator Cooling Fans."

Feb. 6—Victory Dinner, Hotel Astor, New York.

March 5 — Minneapolis Section, S. A. E.—Hotel Radisson. "Tractor Service and Sales."

April 2—Minneapolis Section, S. A. E. — Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

MOTOR SHOWS

Jan. 25-Feb. 1 — Chicago. Passenger cars, Coliseum.

Feb. 1-15—New York. Automobile Dealers' Assn. Charles A. Stewart, Manager, Hotel Woodward, Broadway and 55th St.

Feb. 4-7 — Fargo, N. D. Fargo and Moorhead Automotive Trade Assn.

Feb. 5-6 — Chicago. Trucks, Coliseum.

Feb. 6-15—San Francisco, Cal. Third Annual Pacific Automobile Show, Motor Car Dealers' Assn. of San Francisco, Exposition Auditorium. G. A. Wahlgreen, Manager.

Feb. 10-15 — Rochester, N. Y. Rochester Automobile Trades Assn., Exposition Park. George C. Donahue, Manager.

Feb. 12-15—Defiance, O. Second Annual Show under auspices of Defiance Automobile Dealers' Assn.

Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.

Feb. 15-22 — Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.

Feb. 15-22—Albany, N. Y., Albany Automobile Dealers' Assn. State Armory.

Feb. 17-22—St. Louis. St. Louis Auto Mnfrs. & Dealers' Assn. Robert E. Lee, Manager.

Feb. 17-22 — Louisville, Ky. Louisville Auto Dealers' Assn.

Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.

Feb. 17-22 — Pittsfield, Mass. Pittsfield Automobile Dealers' Assn., State Armory. James J. Callahan, Manager.

Feb. 17-22 — Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.

Feb. 17-22—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

Feb. 18-22—Baltimore, Md. Baltimore Automobile Dealers' Assn. and Automobile Club of Maryland, Fifth Regiment Armory, H. M. Lucius, General Manager.

Feb. 18-22 — Oklahoma City, Okla. Automotive Show. R. H. Haun, Manager.

Feb. 22-Mar. 1—Hartford, Conn. Hartford Automobile Dealers' Assn., Inc., Broad Street Armory. Ben. F. Smith, Manager.

Feb. 22-Mar. 1—Atlantic City, N. J. Auto Trades Assn. of Atlantic City.

Feb. 23-March 1—Cedar Rapids. Auditorium. Automobile Dealers' Assn.

Feb. 24-Mar. 1—Burlington, Ia. Second Annual.

Feb. 24-March 1—Kansas City, Mo.—Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

Feb. 24-Mar. 1 — Springfield, Mass. Automobile Dealers' Assn. Harry W. Stacy, Manager.

Feb. 24-Mar. 1—Portland, Ore. Ninth Annual Dealers' Motor Car Assn., Automobile Palace. M. O. Wilkins, Manager.

Feb. 26-Mar. 1—Mason City, Ia. Fifth Annual. Mason City Auto Show Assn.

Feb. 26-Mar. 1—Madison, Wis. Seventh Annual. Automobile Dealers' Division of Madison Assn. of Commerce, Union Transfer Bldg.

Feb. — Wheeling, W. Va. Automobile show at Market Auditorium.

March 1-15—New York Aeronautical Exhibition, Manufacturers' Aircraft Assn., Madison Square Garden and 69th Regiment Armory.

March — Scranton, Pa. Thirteenth Regiment Armory, Scranton Automobile Assn.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrandt, Manager.

March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.

March 1-8—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.

March 3-8—Columbus, O. Columbus Automobile Show Co., Memorial Building. W. W. Freeman, Manager.

Mar. 3-8 — Muskegon, Mich. Third Annual, Armory, Muskegon Lodge No. 274, B. P. O. E. John C. Fowler and George M. Friant, Managers.

Mar. 3-8—Scranton, Pa. Ninth Annual, 13th Regiment Armory, Scranton Automobile Assn. Hugh B. Andrews, Manager.

March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.

March 5-8—Quincy, Ill. Quincy Automobile Trades Assn., Armory.

Mar. 8-15 — New Brunswick, N. J. Armory, New Brunswick Motor Trade Assn. William Kuehle, Manager.

March 10-15—Paterson, N. J. Paterson Automobile Trade Assn., Fifth Regiment Armory. H. MacGinley, Show Manager.

March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

March 10-15 — Omaha, Neb. Fourteenth Annual, Omaha Automobile Trade Assn., Auditorium. Clark G. Powell, Manager.

March 12-19—St. Joseph, Mo. Sixth Annual. St. Joseph Automobile Dealers' Assn.

March 15-22 — Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.

March 15-22—Harrisburg, Pa. Harrisburg Motor Dealers' Assn., Overland Warehouse. J. Clyde Myton, Manager.

March 17-22 — Great Falls, Mont.—Montana Automobile Distributors' Assn.

March 19-22—Norfolk, Neb. Norfolk Automobile Show Assn.

March 22-29—Pittsburgh Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.

Mar. 26-29—Watertown, N. Y. Tenth Annual, State Armory, Automobile Dealers, Inc. Arthur E. Sherwood, Manager.

Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brode Manager.

April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.

June 2-6—Hot Springs, Va. Convention, Automotive Equipment Assn., Homestead Hotel.

TRACTOR SHOWS

Feb. 15-22—Minneapolis, Minn.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show. Wichita Tractor and Thresher Club. Forum.

Feb. 24-March 1—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building. Kansas City Tractor Club. Guy H. Hall, Sec.

CONVENTIONS

Feb. 4-6—New York. Meeting Society Automotive Engineers.

Feb. 19—New York, 13th annual banquet of Aero Club of America, Waldorf-Astoria.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

Feb. 25-28 — Ninth American Good Roads Congress and 16th Annual Convention of the American Road Builders' Assn. Hotel McAlpin, New York.

April 24-26—Chicago — National Foreign Trade Council, Sixth National Foreign Trade Convention, Congress Hotel.

---

its officials in charge of stations to the service they may give the public by co-operation with state highway commissions, automobile associations and others in keeping open main highways, especially those used for rural express, motor truck and parcel-post routes.

The work in the winter of 1917-18 was in co-operation with the Pennsylvania State Highway Commission. Reports of the amount and condition of snow were made by the assistant superintendents of highways at points along the Lincoln Highway to the Weather Bureau office at Pittsburgh, which bulletined the reports to the press, automobile clubs and motor truck associations.

The official in charge at Pittsburgh also issued warnings of heavy snows for the mountain regions of western Pennsylvania, based on the State forecasts. These were furnished to the press and telegraphed to the State Superintendent of Highways, who gave instructions to his assistants for keeping the routes open.

Increase Gas Shipments to Argentine

WASHINGTON, Jan. 27—The serious shortage of gasoline in Argentine, which, during the war and up to the present time, considerably decreased the use of motor vehicles in that country, will soon be alleviated. The shortage of gasoline was created by the scarcity of shipping space. This matter has been brought to the attention of the shipping officials by the Ambassador from Argentine, and, according to a report from him, steps are being taken so that gasoline shipments to South America will soon be considerably increased.

Foreign Trade Opportunities

WASHINGTON, Jan. 27—The Bureau of Foreign and Domestic Commerce, Department of Commerce, has inquiries for the agencies of automobiles and tractors. Full information regarding each of the following can be secured by addressing the Bureau of Foreign and Domestic Commerce and referring to the foreign trade opportunity number.

A man in France desires to purchase or secure an agency for the sale of low priced automobiles. Terms, thirty to ninety days for large accounts, ordinarily cash. Correspondence in English. References have been filed. Foreign Trade Opportunity No. 28169.

An agency is desired by a man in Switzerland for the sale of tires. Correspondence may be in English. References have been filed. No. 28182.

CONTINENTAL MOTORS
Powerful as the Nation
AMERICA'S STANDARD

"This Continental Red Seal Does More Than Guarantee a Good Motor"

When you see a motor with the Continental Red Seal you know that you've found a good motor.

When you see a truck with a Continental Red Seal Motor you can be pretty sure that you've found a good truck.

Good motors marked with the Continental Red Seal are not accidents, but certainties. These motors have been tried out, in hundreds of thousands of truck and passenger cars, under every conceivable condition of service over a period of sixteen years. Their merit, consequently, is sure, essential, dependable.

Good trucks embodying the Continental Red Seal Motor are the rule rather than the exception. The several-score manufacturers of trucks and cars that use Continental Motors in their product year after year, thus show their willingness to buy the best obtainable. Their judgment in respect to the other units selected is apt to be equally good. Certainly these manufacturers are among the most stable and most successful in the entire industry.

Make sure that the Continental Red Seal is on the motor in the truck or car you buy.

Views Held on Commercial Possibilities in Aviation

Conservative Control of Industry Essential to Avoid Errors of Over-Optimism That Would Give Setback to Aerial Commerce

By David Beecroft

LONDON, Jan. 21—The undreamed of growth of military aviation in Great Britain since August, 1914, constitutes the greatest reason for her laying bold plans for unexpected progress in commercial aviation now that peace has come. Figures of aviation growth during war read like chapters from the Arabian tales. In 1914 Britain had but 285 officers in her Royal Air Force. When the armistice was signed she had over 30,000. In 1914 she had but 1853 of all other ranks, which insignificant total had reached 260,000 in November, 1918. To this total must be added 30,000 women and boys connected with the force in November, 1918.

British Capacity 40,000 Planes Yearly

When the armistice was signed Great Britain had factory capacity to build 40,000 airplanes and 30,000 aircraft engines per year. Some of her finest war factories have been built for aircraft production. Not only are these among the largest, but they are the most modern. The world has nothing that surpasses them and few that rival them.

Add to this the history of the Royal Air Force during the war and it is not surprising that the future of aviation in England is provoking more discussion and is the cause of more comment than any other subject. This is rightfully so, because the aircraft industry is the only one that was entirely without pre-war standing, and hence had no pre-war establishment to fall back upon as have practically all other war industries. There is little wonder that in a land like the British Isles, where there have always been more men than jobs, that not only the government but also those back of the aircraft factories should be bending every effort in weighing the possible future of aviation, which means largely commercial aviation.

Military Requirements Relatively Small

There is no disputing the fact that army and navy requirements on a peace basis cannot consume more than a small fraction of the possible production of the aircraft factories now in existence. Either these factories must be turned over to other uses, such as manufacture of bicycles, motorcycles, furniture, motor car bodies, etc., or be salvaged by the government.

The possible alternative is forcing commercial aviation, which could not possibly take up the factory slack. Fortunately the conservative element in British aviation is so far in control of the situation and it appears that Great Britain and probably the

world is to be spared the debacle that would inevitably follow should all kinds of commercial, passenger, and mail services be hurried into existence, with the primary aim of keeping the aircraft factories on a rational scale of production.

Lord Weir, who until the recent election was head of the Royal Air Force, has been a leader in the present plan for conservatism in commercial aviation, and who incidentally is one of the greatest aviation enthusiasts, summed up in his recent Manchester address the sane policy for commercial flying when he said:

Impatience Will Prejudice Future

"I am an enthusiastic optimist on the future of aviation, but I hope my optimism is sane, and therefore I shall venture to insist that in this highly critical period in the history of the new transport nothing but harm can come from not facing the facts; and I will add my opinion that the future of aviation may be greatly prejudiced by impatience for showy results. The success of the operational side of air transport will depend upon measures that cannot be carried out in 5 minutes.

"These measures are: The development of navigational instruction by really sound and severe navigational training, the creation of an energetic meteorlogical service specially designed to help air transport, the adoption of improved systems of wireless telegraphy and telephony, and the adoption of a first-class system of day and night marking of landing places and aerodromes.

"If these measures are taken I am quite clear that 5 years hence there will be no more difficulty in navigating an airplane over a long course in foggy or otherwise bad weather than there is now in navigating a ship at sea.

"If these measures are not taken, if hard and continuous experimental study is not put into the problems yet unsolved, then trouble, delay and discouragement will certainly ensue.

Study and Experiment Necessary

"The technic of flying and the organization of air transport still demand long study and many experiments for their perfecting. True, wondrous stunts are performed in the air, and these stunts have been immediately useful in the art of war and they will continue to be useful for the testing of machines, but aerial gymnastics and acrobatics in the firmament have really little to do with the operational side of aviation.

"The air traveler of the future will have no desire to take part in a circus. He will want to be sure that on a given day, to be settled in advance, he can leave, say, London at a certain hour in the morning and arrive, say, at Marseilles at a certain hour in the afternoon, whatever the weather."

This view of the essentiality of conservatism is shared by most of the leading aviation spirits in Great Britain, including those with large financial investments in factories and aerodromes. They all agree that rash precipitation in the starting of passenger and freight aircraft services, and attempting to operate them even on a symptom of schedule would prove the sorest boomerang to the development of commercial aviation along all lines.

The opinion is very generally shared by all in Great Britain, France and Italy that the worst that possibly could happen would be starting a passenger service from London to Paris and endeavoring to maintain a schedule. Such a service is to-day impossible except for purely military uses, but if the laws of international flying, which will be approved so far as the Allies are concerned at the Peace Conference, permitted such it would be equivalent to suicide for the future of the industry to attempt such at once. One serious accident such as a crash of a large plane with twenty to forty passengers aboard would almost certainly result in the death of most of the party and would set back passenger aviation transport perhaps a decade. Such an accident is the very thing not needed today. Such an accident is the very thing that all those men with heavy investments in factories are doing all in their power to guard against. This conservatism of theirs is the best proof of their confidence in the future of flying and the truest criterion of their deep-founded enthusiasm and optimism in the art.

One Accident in 25,000 Miles

This conservatism does not mean that planes have not been a success in war, or that the art of flying has not been adequately mastered. A few figures on the amount of flying done in certain periods of the war disprove this. Accidents during the war appear less alarming when the facts are considered. Figures obtained since the armistice show that in training and flying there has been only one accident for every 25,000 miles covered by the Zeppelins and the Gothas, the latter the large German bombing planes.

This percentage of accidents can be reduced very greatly under a peace regime, and even in war they do not appear so great when the amount of work accomplished by planes is considered. Take photography alone: the R. A. F. in 6 months of 1918 took 250,000 photographs on the western front, photographing every acre of the 6000 square miles covered. In area this is equivalent to a rectangle 200 miles long and 30 miles wide. Over much of this territory it was impossible to land without crashing the machine, a condition which would not rule to anything like the same extent in commercial flying. A portion of these photographs were taken at night by the use of flares, which proved successful.

War Aviation Achievements

In war flying there was much work done that gave an indication of what may be expected from commercial developments. Bombing by airplane started in 1917, when the British dropped 1000 tons of bombs, but in 6 months of 1918, and the first 6 months, 6000 tons were dropped on the western front alone. This amount was only limited by the lack of bombing planes which were only getting into production in England when the armistice came up.

Had the war lasted a few weeks longer there would have been British planes bombing Berlin, and hundreds of new bombing planes would have been produced each month.

G. Holt Thomas, head of one of the largest aircraft factories in England and who for 10 years has taken a leading interest in commercial aviation, summed up his convictions on the subject in these words:

"Aerial navigation will revolutionize the world not only from a commercial viewpoint, but from a humanitarian point, much more indeed than it has revolutionized warfare, although the effect on warfare has been very great.

Flying a Transportation Adjunct

"I am not one of those who think that commercial aeronautics are going to beat railways and other forms of transport out of existence, but rather that flying will act as an adjunct to the present modes of transport.

"For those in a hurry nothing can compete with the airplane, and for those going on special services it is of the greatest use. This alone opens a very wide field indeed.

"Commercial flying will be carried out in short stages of 250 miles per flight, and pilots will not fly more than three or four days per week. It will be necessary before flying can be carried out commercially to have landing fields every 10 miles.

"Our commercial machines will have a speed of at least 100 miles per hour and engines for these should have a useful life of 500 hours between complete overhauls. Our engines will be heavier than those used in war machines, and cost of manufacture will be reduced as weight of engine is permitted to increase. In 5 years no water-cooled engine will be used. Air-cooling is certain to become universal in commercial aviation and the star or radial design of engine with fixed cylinders offers the greatest possibility in this field of development.

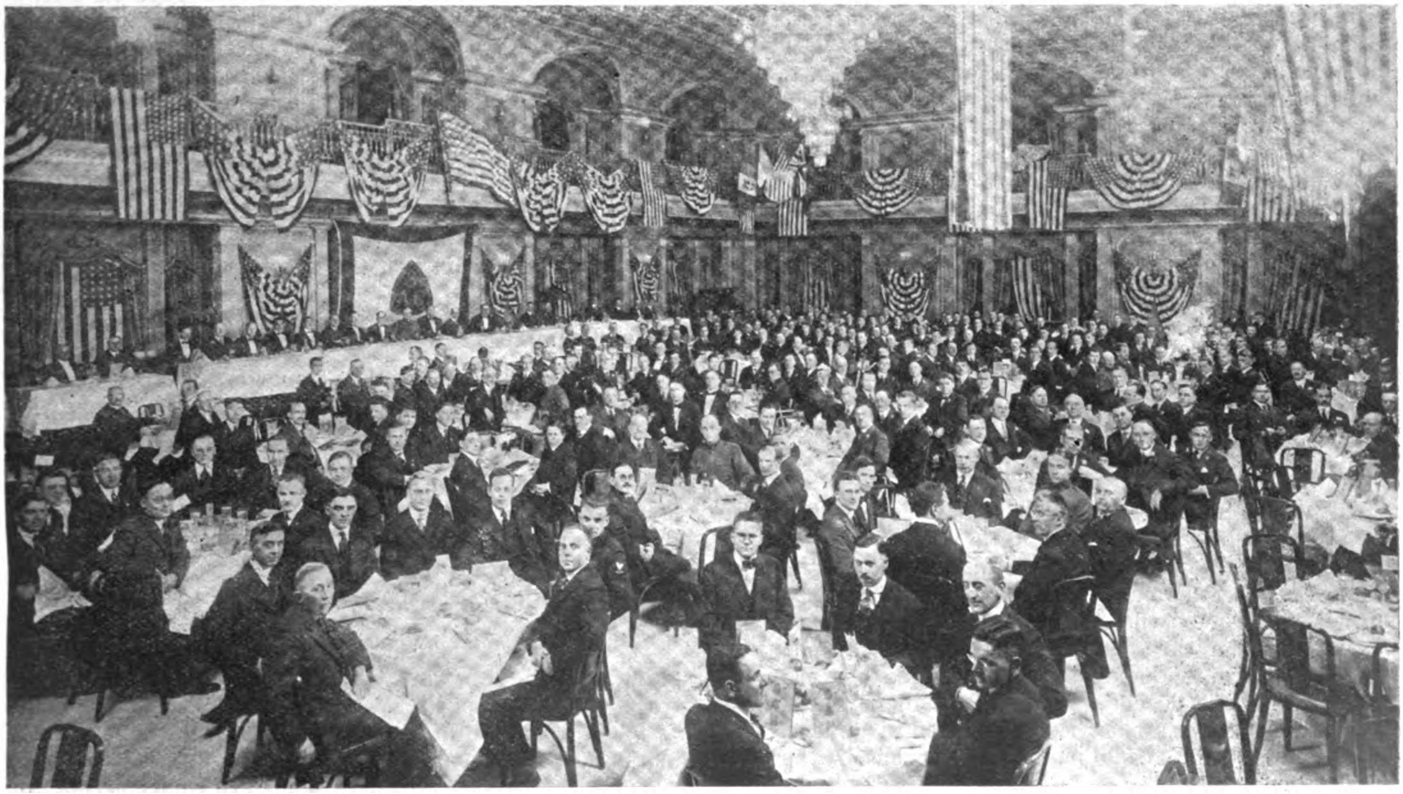
"The future of the dirigible is one to attract firms considering the aircraft field. The dirigible is destined to be the great vehicle for oversea transport, and is the only machine suitable for transatlantic work. The Atlantic may be crossed this year by an airplane, but such accomplishment will serve of little value as a commercial accomplishment, but rather will merely serve as a demonstration of aircraft pioneering. The future of trans-ocean travel lies locked-up in the lap of the dirigible.

The Freight-Carrying Plane

"The freight-carrying airplane has yet to be developed, although several types used in war can be used in this field. The freight airplane will have a speed of at least 75 miles per hour, and its primary requisite must be reliability. Its engines must be the last word in efficiency and reliability."

Like Lord Weir, Mr. Holt Thomas is a great aerial enthusiast, but he is an equally conspicuous aerial conservatist. He, too, recognizes the ill that will

Home-Coming Supper of the S. A. E. During Chicago Show



More than 400 members of the Society of Automotive Engineers and their guests attended the Home-Coming Supper of the S. A. E. during the Chicago show

come to the industry if precipitate rashness is given a rampant leash.

Perhaps the final word from Great Britain on the commercial possibilities of aviation and the best attitude to take with regard to the aircraft industry in Great Britain comes in the final report on civil aerial transport recently issued by a committee of representative character on this subject. This committee recognizes the gravity of the present factories and the industry as a whole and also the course to pursue regarding commercial flying. They reported that:

"We strongly support the views that the carriage of mails, of passengers, and of certain classes of goods by aircraft will present no difficulty from the technical point of view. We are confident that demands for aerial services to provide such carriage will arise immediately at the conclusion of the war, and that it is imperative that every endeavor should be made to prepare for these demands. Such aerial transport service cannot be developed by the ordinary commercial methods so as to secure the required result, and the state must take action of some kind in developing such service."

This committee looks forward to several improvements in aircraft before it has progressed far in its commercial stages. The increased use of folding wings and the use of some form of braking mechanism so as to diminish the space needed for landing must be anticipated. Possible developments in the gyroscope, the turbine and directional wireless are looked for.

Great Britain to Continue War-Time Restrictions on Automobile Apparatus

Some Months Needed for British Industry to Start Peace Plans

LONDON, Jan. 17.—For the present there is little hope of a removal of the total restriction order prohibiting the importation of automobiles and motor trucks into Great Britain. Ever since the signing of the armistice automobile and truck importers of French, Italian and American makes have been asking for a ruling but without success.

To-day a group of manufacturers representing practically all of the leading industries waited on Sir Albert Stanley, president of the Board of Trade, which has the power on such matters, and they were assured that there will be no removals of restrictions on any class of merchandise without first consulting with the British manufacturers engaged in the same line of manufacture. This can only be interpreted as meaning that in the case of the automobile, truck and farm tractor the British maker will express his opinion to the Board of Trade before any removal or consideration of removal of restriction will take place. This declaration of policy is not considered favorable to the importer, who has the feeling that the British maker wants the total restriction continued for several months until he gets squared around, decides what he is going to produce as a post-war model and gets ready for production of such.

Will Impose Additional Restrictions

In a few instances import restrictions have been removed since the armistice, but the Board of Trade announced that in every case these restrictions would be reimposed and further intimated that additional restrictions will be imposed as necessary. None of the restrictions on motor car imports had been removed except in one or two individual cases, and so this clause of the Board of Trade decision does not specifically apply.

The Ford company has been permitted to go ahead with the manufacture of 3000 passenger car chassis, the parts for which were imported by the government for war uses. These are now being assembled at the rate of 60 per day, and when the supply of parts is exhausted the production will practically cease. In the meantime the company is getting ready to manufacture all of the parts in Manchester. These cars are being sold at $1,000, which is a high advance on pre-war prices and which price is understood to apply only to these 3000 chassis. The parts were purchased at war prices and war freights paid on most of them, which explains to an extent at least the high price. It is understood Sir Percival Perry, manager of Ford interests in Great Britain, was given permission to go ahead assembling these 3000 chassis in consideration for his having cancelled certain government contracts at once. The permission to assemble these 3000 chassis would otherwise be considered a special favor to one importer over another. Ford, however, is the only concern with an assembly factory in England, and this comes as a natural favor for such enterprise. The bodies for these were made in the Manchester factory, as are radiators, the sheet iron work and some other parts.

Other Importers Concerned

In the meantime the other importers are not over-optimistic. They maintained their salesrooms and service buildings during the four and one-half years of war and at the same time most of the men were engaged on one kind of war work or another. Since the armistice they have been doing a good business in used cars of all makes. In some instances the same car has been sold not fewer than three different times since 1914, and the last selling price was 25 per cent above the original sales price when new.

These importers have kept their service departments going during the war, many having government contracts for small parts of munitions. Some have made as much money as in peace times, and some have greatly increased these departments since 1914.

In the meantime their salesrooms are empty except for a used car or two, as the only action they have obtained

Dealers' Interpretation of Public's Desires Real Show Lesson

Individuality in Outline and Color, with Great Attention to Detail in Show Cars

By J. Edward Schipper

THERE is a lesson in the New York Show for automobile manufacturers, one which if taken cannot help but leave its stamp on the industry. The lesson is brought home by the dealers of New York who have produced a show which is a brilliant success from a merchandising standpoint. What the dealers have learned in their intimate contact with the public, the manufacturer can in turn learn from the dealer by a study of the underlying features of the display at Madison Square Garden and the 69th Regiment Armory.

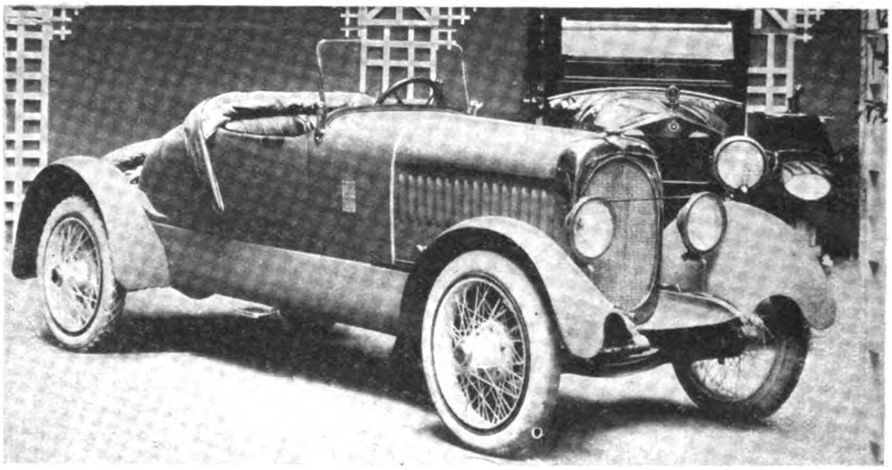
Manufacturers have felt themselves at a loss during the last few weeks to interpret properly the feeling of the public as expressed in their desire for cars. The dealer knows the public because he is constantly rubbing elbows with it and is always in touch directly with the ultimate buyer. He has not had to turn his attention to war manufacture in a way which would cause him to lose that intangible contact which is so necessary to successful sales plans.

The fact that this is a dealers' show has made it possible for the dealers to give free rein to their knowledge of the psychology of the buyer, with the result that the display fairly sparkles with silent salesmanship that is really compelling the attention of buyers to a degree not equaled at any show for years. Cars are being bought off the floor in record numbers and prospect lists are growing with a rapidity that is astonishing the most optimistic of dealers.

* * *

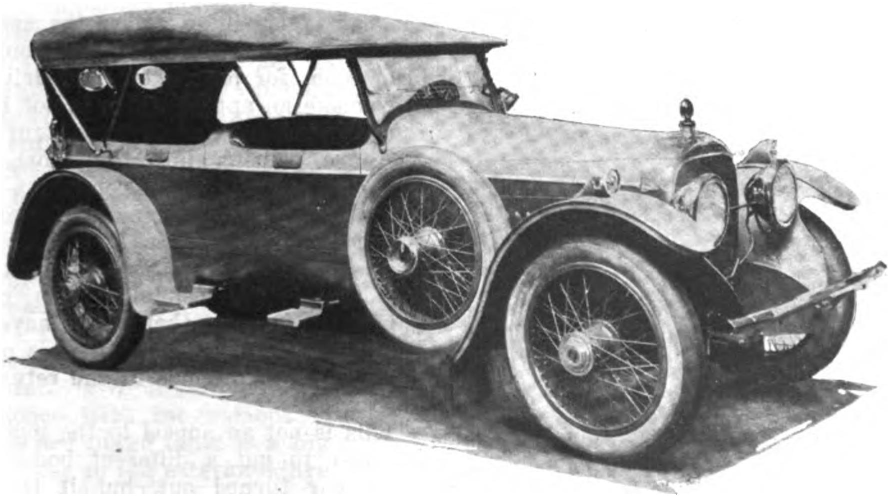
Distinctive Bodies the Keynote

It is in the body of the car that the secret seems to be contained. The American public, at least that part of it centering along the upper Atlantic seaboard, is yearning for individuality. There is a desire to break away from the somber color, the cut-and-dried body line—and to have a car which expresses the purpose for which it is intended. The New York Show is an exhibit of special bodies. Many dealers have not a single stock body on the floor. They are showing bodies which have been designed for them to meet the ideas of the public that they are used to serving. The result is that in the Garden and the Armory there is a display of striking bodies that practically equals what we have been used to finding at the Importers Salon.



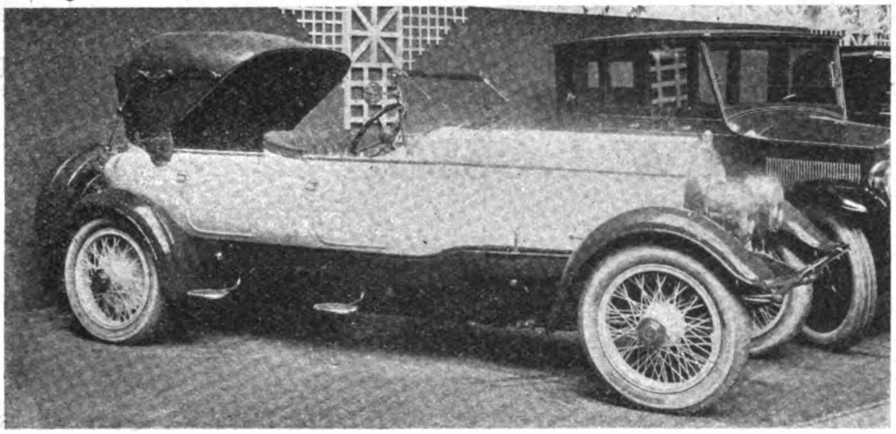
The Noma, which is the only really new car at the show, features a distinctive type of roadster body

It is not possible to put these bodies into production. It would not be desirable to put many of those which are proving of the utmost interest to car buyers into production, but the bodies which occupy the booths of the exhibitors are so replete with suggestion for the manufacturer that his engineer and designer could spend a week in close study of the ideas here evolved without exhausting the subject. Refinement of detail alone could occupy the attention of a man for three days.

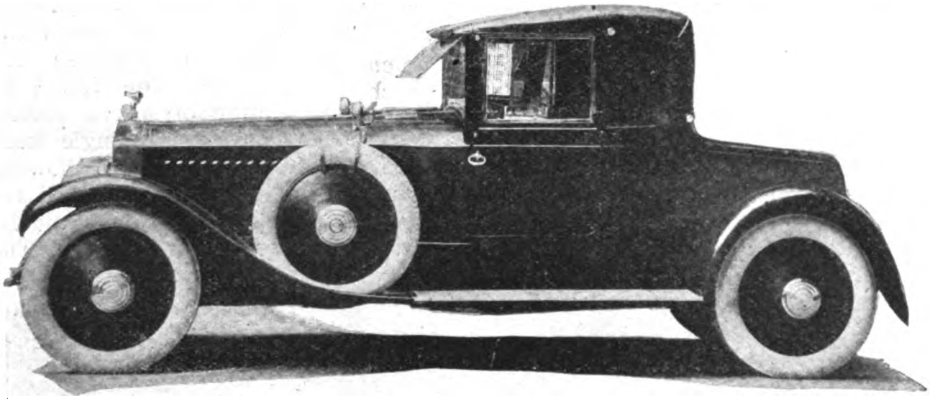


Unusual treatment of the body panels and the absence of runningboards mark this special Cunningham model

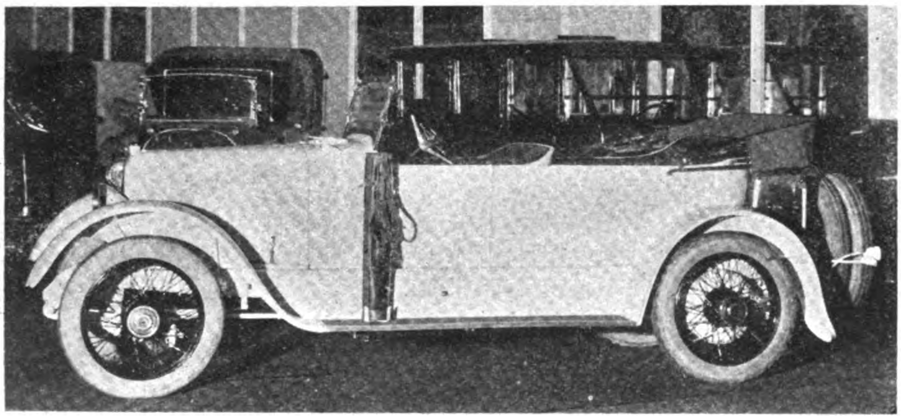
Equally important is the departure



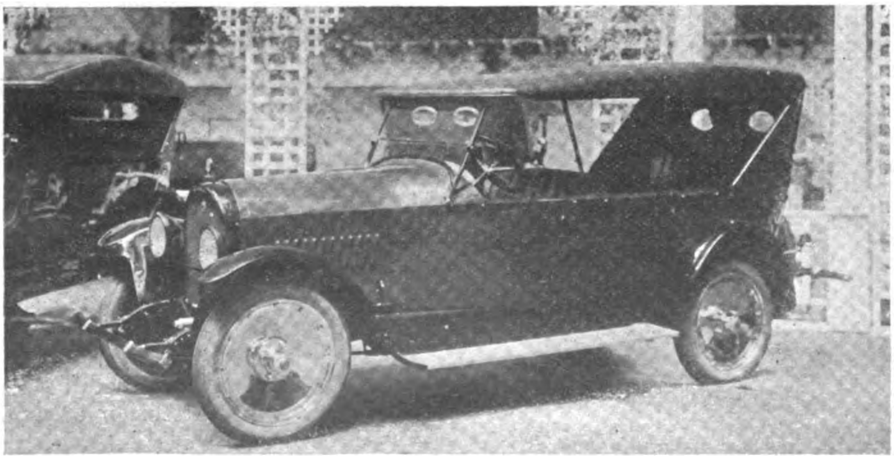
This is a Brooks-Ostruk touring body on a Pierce-Arrow chassis



Another Brooks-Ostruk body—a cabriolet model fitted to a Rolls-Royce chassis



Daniels exhibited a white touring car, reflecting individuality in bodies



Disk wheels very considerably alter the appearance of a stock model, as may be seen by this standard Westcott

from the conventional lines of the past and the suggestion of exterior lines which not only lend themselves with the greatest of adaptability to useful purposes but which strike the American buyer at a point where he is becoming very vulnerable, that is his taste for personal individuality.

It is true that the buyer of the Metropolitan district is different from the buyer of other districts. He does not use his car for business nearly as much, since, as a rule, he is a dweller of the larger cities, where the impossibility of parking makes it necessary for him to keep his car in the garage for the business week. This makes him perhaps an even more enthusiastic motorist than his Mid-Western brother who uses his car every day of his business life. Since the dwellers in the Eastern district number about 10,000,000, or one-tenth of the population of the country, the wishes and modes of living of this part of the country become a considerable factor.

* * *

Sport Bodies in Demand

If the manufacturer will study what the dealer in New York has found to be a potent factor in the selling of cars, he will find that the man who uses his car for pleasure always seeks to get away from the usual and get something which interprets the purpose for which the car is intended. In a word, there is a demand for a sport type of car that is unfilled, and yet this demand is so keen that special cars of this type made up by dealers and mounted on standard chassis are being snapped up by the public. They are being bought eagerly off the floor of the Garden and the Armory.

The sport type is not the only car that appeals. The closed car of special lines is even more popular. When the car is low-hung, when the seats are comfortable and yet have enough head room for passengers and driver they make an appeal which is not being resisted by the Metropolitanites who are pouring into the show in record numbers. The pendulum is swinging over to the side of unrestrained desire for the gratification of wishes that were denied during the war days. The pendulum has not gained the impetus that it will have a little later. In fact, the show is one of the first indications of the return ing swing.

This is not an appeal to the manufacturer to put a different body on every car turned out, but it is an attempt to reveal a lesson that can be taken home and interpreted on a production basis—the necessity for re-

fined detail, the advantage of breaking away from the crowd, if it can be done without the semblance of freakishness and with the accomplishment of a result in usefulness as well as appearance. A study of many of the bodies on the floor which at first sight are special all the way through brings to light that it is only the fit of the doors, the arrangement of the trim and the really artistic paint work that distinguish it from the regular stock model.

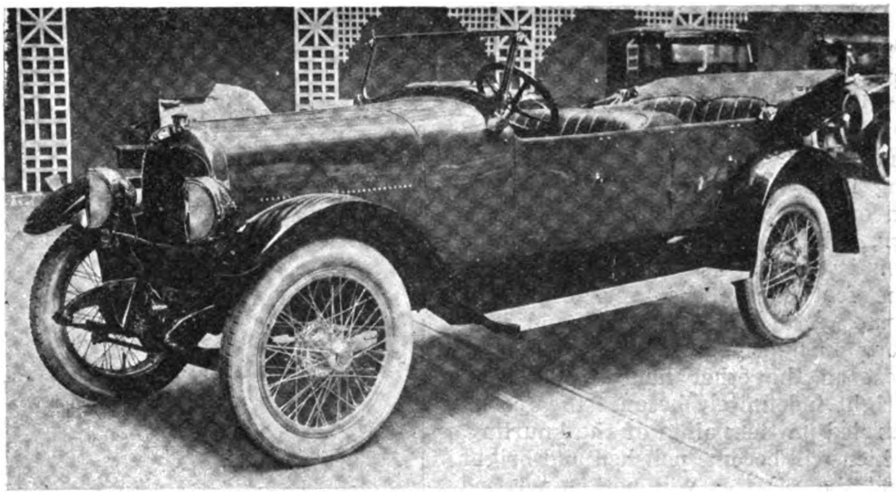
* * *

Special Bodies Not for Low-Price Cars

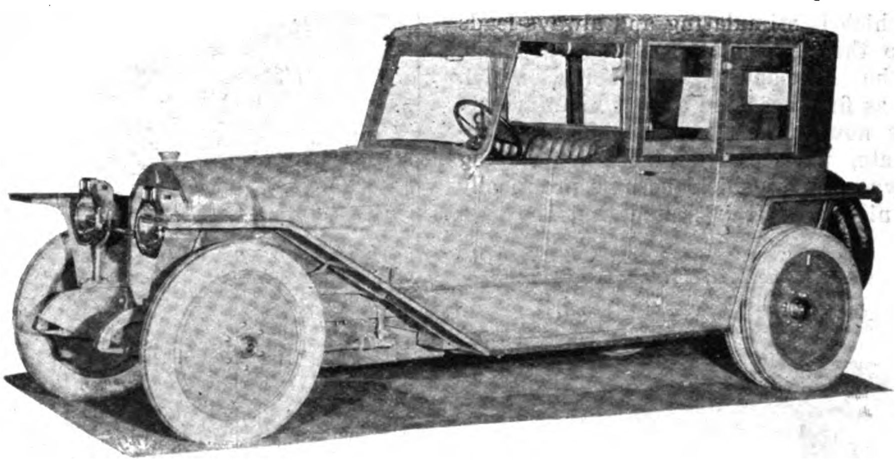
One of the points which cannot help be noted is that it is foolish for the manufacturers of low-priced cars to attempt things in body design which can successfully be carried out in higher-priced cars. There is nothing, for instance, so difficult to produce commercially at a low price as a body in sheet metal that depends for its appearance on a bold straight line. A line of that sort is either straight or crooked. There is no intermediate. It cannot be more or less straight. It is either straight or not. This means careful work and substantial building which cannot be taken care of on a production basis where a matter of 50 cents per car is regarded as serious.

Imitation of a successful thought by another manufacturer who perhaps makes a car costing five or six times as much cannot always be made a success. This is quite evident when the cars stand side by side at the show. This has another angle which does not show itself on the surface. Often the design of the higher priced car is one which entails structural weakness unless it is accompanied by the best kinds of materials or by compromises in other directions. A simple example of this will explain what is meant. The concealed hinge on the doors of touring and other open cars was first adopted by manufacturers who could pay a high price for the skillful work required in making concealed hinges as nearly correct as they could be made. Manufacturers of cars of all price ranges fell in line, with the result that door rattles on American cars are practically as common as the cars themselves. Furthermore the doors do not open as far, and there have been many torn garments as a result. After the bad experience with the various types of concealed hinge there is a big return this year to the exterior hinge, where even in the lower priced jobs the strength is sufficient to allow a man to sit on the door without making an incurable rattle in the joint.

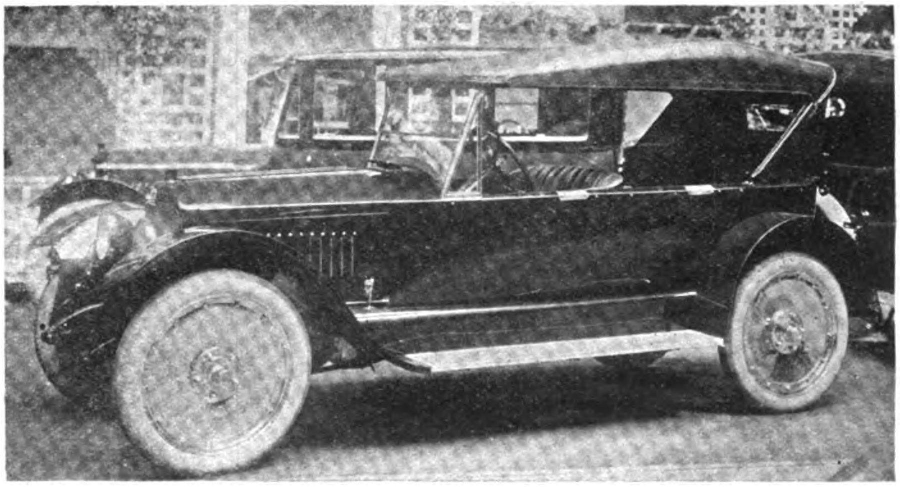
Beading over the edge of doors has proven very satisfactory. It is possible in the high priced cars to get a flush door that really fits, but an inspection of the doors of the lower priced cars shows that the difference in the width of the opening is very marked on bodies coming through in the same production run. The moulding allows for this nicely.



Paige exhibits a type of sporting touring model in which the high hood and rather unusual lamps are noticeable



Special type of Locomobile limousine designed for the use of General Pershing. Note dual rear tires and windshield



A Standard touring model has an unusual windshield with side pieces that increase protection and brace the shield

There are a great many little kinks that make their appearance on the special bodies, however, which can be readily taken as production items without adding materially to expense and at the same time greatly increasing utility or beauty. For instance, on one of the Locomobiles there is a knurled foot rest. The advantage of this is quite evident. In a short time the foot bar in the average car becomes scratched and worn and is a very unsightly affair. The knurled rest on the other hand will remain bright indefinitely because the foot is carried on the points of the knurling, which will become polished and bright and the recesses will not be touched by the foot, thus allowing them to retain their finish.

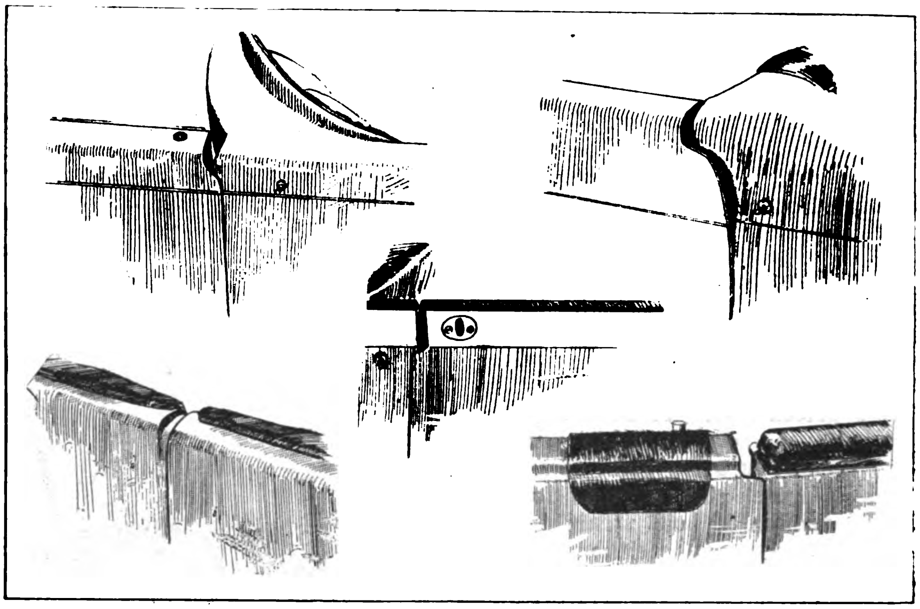
Differences in opinion over details in body design provoke a discussion which is stimulating and always leads to the best solution of the problem. The overlapping windshield which was first accepted almost unanimously is now a matter of considerable debate, particularly since the sloping type of windshield became practically universal. It is stated that the rain is swept into the overlap groove and that no protection is offered at all. The result is that many of the cars at the show have a rubber moulding inserted in the strip. This is not the kind that was used three years ago and was always falling out or becoming lost, but is a semi-permanent fixture.

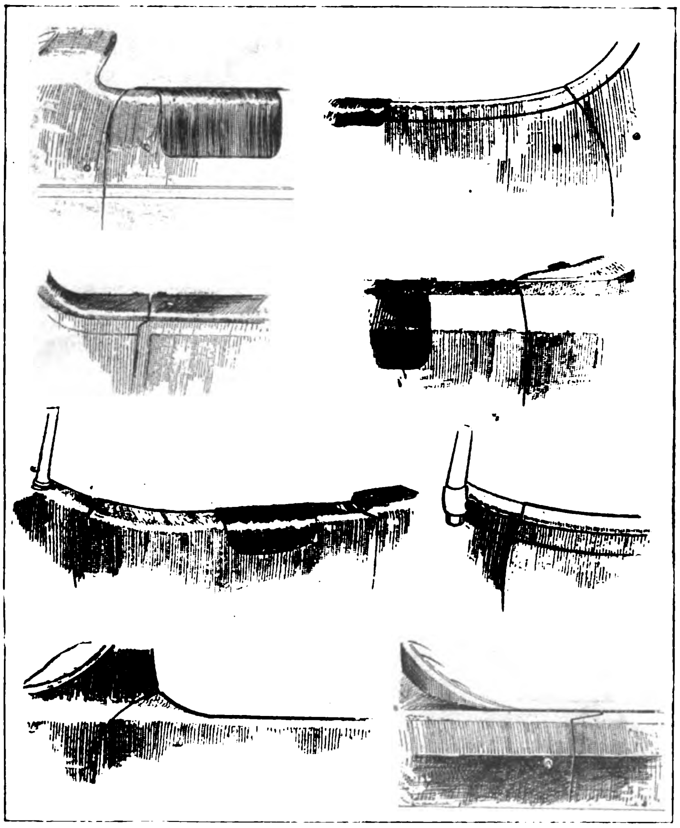
* * *

Are American Cars Too High?

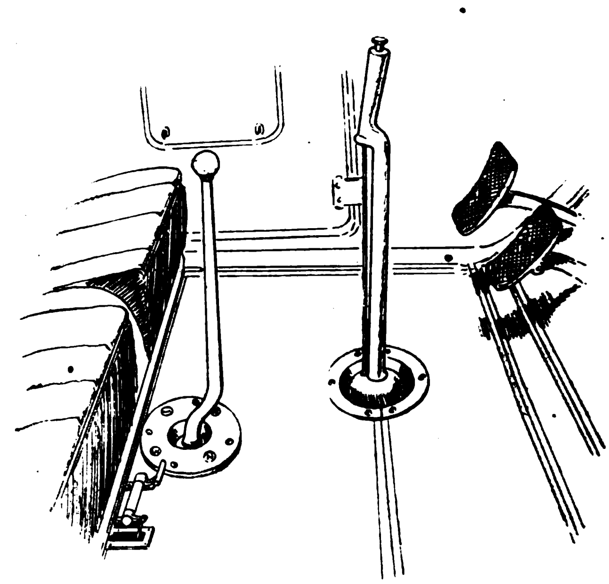
Returning travelers from Europe who are close students of automobile design say that their first impression of our cars after a long sojourn abroad is that they are all too high. They state that it is not because we have more clearance than the cars abroad, but because of the smaller wheels and the suspension layout. It is a matter of comment among these men that our cars seem high in the air, particularly at the rear. The closed cars of Europe have their tops often on the level of the top of a man's head when he is standing on the ground. As there are many of our cars which are so high that it takes an upstretched arm to reach the top, it cannot be solely a matter of clearance. Our cars have more head room inside, but it is a question if this is really needed, as there is no necessity to stand in the car.

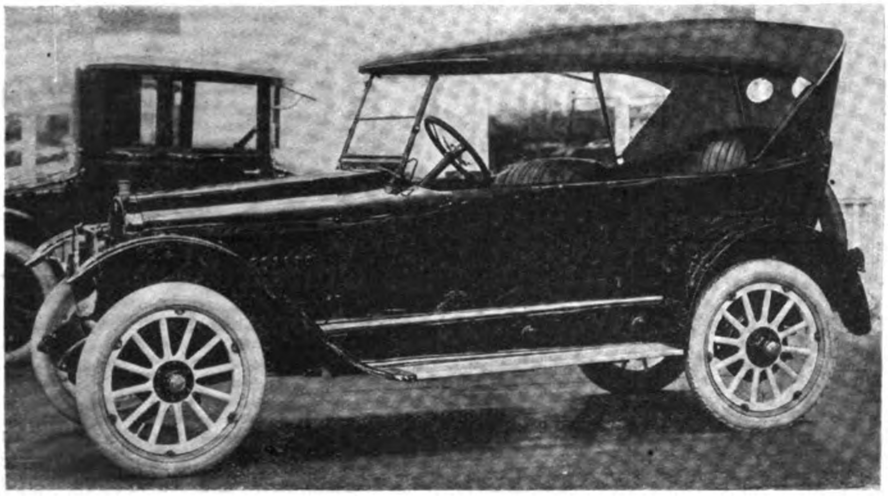
All of these matters deal with de-





Above are a few prominent examples of poor body fitting, both at the hinge and at the jamb ends of doors. At the left are a few examples of well-fitting doors. Below is the unusual arrangement of the control levers in the McFarlan





A new Mitchell model makes its appearance at the show

tail and yet they serve to bring out the general fact that since the cars at the show excel in this respect, and since the cars are largely special insofar as body design is concerned, it is necessary for the manufacturer to get a closer interpretation of the desires of the buyer. It is going to be a matter of getting back in this respect because the ordinary avenues of information have been closed during the war period.

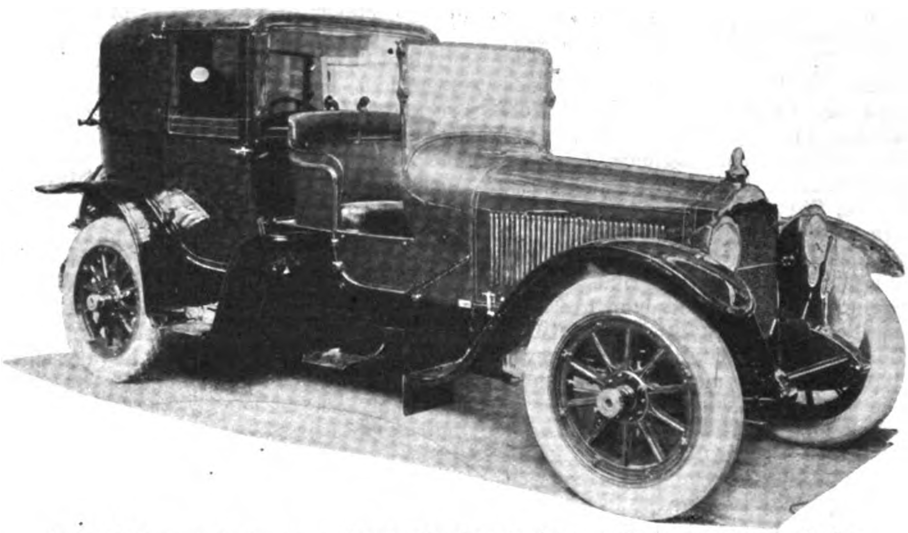
The use of more colors than ever shows that there has got to be a departure from the old standard black. Where we get into color it means that more than one color has to be offered, which brings us back to where we were 5 years ago in the matter of color options. These were gradually weeded out by the manufacturer who made cars in quantities, although the 10-a-day maker has kept some of the options.

There is a well-established demand for a real sport car. This demand is evident enough to justify its production in quantities. Abroad, the makers have realized this market far more than we have, and there is hardly a maker who does not have a stock sportster. This car would not only sell along the Atlantic seaboard, but would be in demand throughout the country, although the Metropolitan district would no doubt present the greatest demand for the reasons already explained. This sport car must not be something freakish, but should satisfy the lover of suburban excursions or of country-club life, a person who is greatly on the increase in large as well as small communities. This type of car is admittedly a recreation vehicle or implement to as great an extent as a golf bag or a tennis racket. Automobiling is the recreation of tens of thousands of Americans. A big percentage of these would be appealed to directly by such a car. The New York show tells that story.

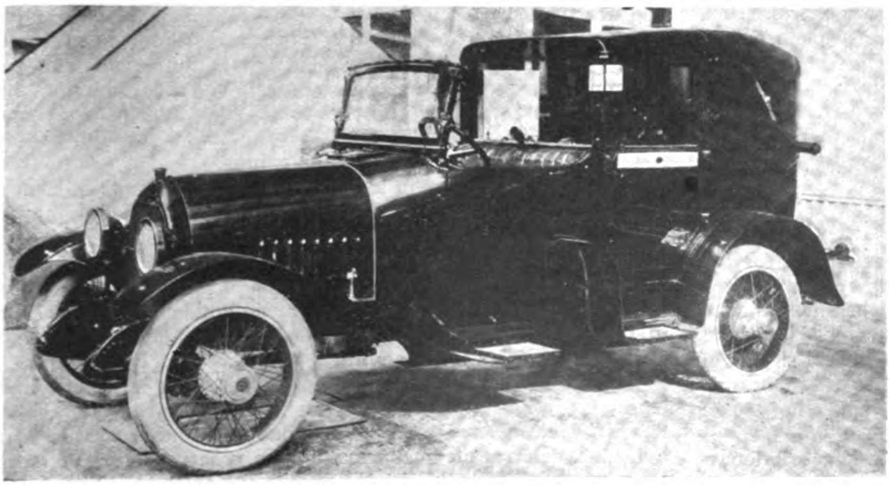
* * *

Public Has Been Educated

One great thing must be remembered in selling our new products. We are selling to a public which is buying its second, third or fourth car. This means a public which wants something different in appearance from what it had before; something refined, in which the little past mistakes are corrected. Refinement of detail, individual bodies, distinctive but enduring and serviceable color, all are being looked for, far more than radical engineering development at this particular stage of the industry's development.



This Holbrook body on a Packard chassis is a well-proportioned design, though quite out of the ordinary



Somewhat similar treatment of the fenders is apparent in this Daniels town car model, which, however, has front doors

Fiat Supplied Over 50,000 Motor Vehicles

NOW that restriction against publishing the actual output of factories supplying material to the armies has been removed, the Fiat Co., Turin, Italy, has made public the statement of the number of cars and lorries it supplied for army use.

In 1914, while Italy was neutral, only about 500 vehicles were supplied. Between Jan. 1, 1915, and Oct. 30, 1918, the number totalled 50,000. Of this number 30,000 went to the Italian army, 15,000 to the French and 5000 were divided among the American, British and Portuguese armies.

New Engineering Features at Chicago Truck Show

Ten Makers Exhibit for First Time and There Are Nine Other New Models—Tendency Toward Oil Lubrication of Chassis Parts Apparent—One Steam Truck Appears

CHICAGO, Feb. 3—Contrary to general expectations, there is much in the way of engineering advances and in the number of new models at the exclusive motor truck show which opened here to-day under the auspices of the Chicago Automobile Trade Association.

No less than ten new companies exhibited their vehicles for the first time at any show and nine brand new models of trucks of old concerns are shown. Among the new concerns formed during 1918 and putting their wares on display for the first time are the following:

Winslow Motor & Engineering Co., Chicago, maker of the only steam truck at the show; Mutual Truck Co., Sullivan, Ind.; Paige-Detroit Motor Car Co., Detroit; All-American Truck Co., Chicago; Dearborn Truck Co., Chicago; Hebb Motors Co., Lincoln, Neb.; Tower Motor Truck Co., Greenville, Mich.; Transport Truck Co., Mt. Pleasant, Mich.; Nelson Motor Truck Co., Saginaw, Mich.; and the Panhard Motors, Grandhaven, Mich. New models of Acme, Master, Commerce, Signal, Dorris, Stewart, Available and Fulton trucks are shown.

The Brockway modified Class B war truck could not be shipped to the show in time, although two other makes, the Signal and the Clydesdale, are fitted with modified Class B engines as offered by the Continental Motors Co., Detroit. Both of these installations, however, have single instead of double ignition, making use of magnetos. This requires the use of a new detachable cylinder head with only one set of spark plugs. The electric starter and lighting as originally furnished on the Class B engines are missing from those so far employed for commercial service.

A tendency toward the use of oil instead of grease for the lubrication of the springs, bolts and shackles is also evident, fourteen of the fifty-two makes of trucks exhibited employing some form of oil lubrication. These include the Patriot, Couple-Gear, Brockway, Paige, Master, Rainier, Clydesdale, Bethlehem, Indiana, Nash, Lapeer, Oneida, Available and Dorris. The Mutual truck, which at first used oil, is the only make shown which now employs grease.

The turning up of grease cups at the proper intervals has always been one of the hardest things to get a motor truck driver to do. The use of oil cups makes it much more convenient for the driver. Two brands of trucks use the Alemite method of greasing, in which a small cylinder is screwed into the hollow spring or spring-shackle bolt. This cylinder has a small check plunger which is forced in to admit the grease from a regular grease gun so that the lubricant does not have to be put in with the fingers.

Closed Cabs Increase

There is also evident a tendency to fit inclosed cabs for the protection of the driver, and about six of the models exhibited are so equipped. In most cases these are furnished as standard equipment and included in the set price of the chassis without the body. Some are of wood and others of metal, more of the latter type being evident this year than ever before. Some others accomplished the same end through the use of curtains.

Two new models of Available trucks have several departures in design, including a new method of brake equalizing, a new method of front axle mounting and a two-step running-board. The brake equalizing is accomplished by two flat equalizer rods, one above the other, which run in slotted members fastened to the under side of the truck frame near the midpoint of the chassis. These rods extend crosswise of the frame and move forward in a longitudinal direction toward the front end of the truck as the brakes are set and backward as they are released.

The Timken rear axle used has two brakeshoe segments in each drum, and under the ordinary method the two forward shoes are moved into contact with the drum when the emergency brake lever is pulled, or vice versa, and the two rear shoes when the foot pedal is used. This sets up a strain in the axle which the Available company has overcome by connecting one of the rear shoe rods to the transverse equalizer rod on one side and one of the front shoes on the other side, thus tending to equalize the entire action.

Improved Steering Connections

The front axle of each of the new models is set on a slant from the front to the rear by making the rear end of the spring lower than the front. When an obstruction is encountered, the wheels tend to mount it without the strains set up when the axle is set level. The steering arm knuckle is also set over the centerline of the axle so that its arc of movement is very small when the spring is deflected. This gives an easier steering truck.

The All-American truck heats its fuel four times before it enters the cylinders. These four heatings are made possible by mounting the gasoline tank directly above the engine under the hood, by a hot-air jacket around the air intake pipe leading to the carbureter, by passing the gas through the cylinder block after it has left the carbureter and by then making it impinge on the hot sides of the intake manifold, which is cast integrally with the exhaust manifold.

The Winslow steam truck is perhaps the newest vehicle at the show. The Winslow company has built only one model to date, the 5-tonner at the show, although it is intended to bring out smaller units at a later date. The truck is fitted with a four-cylinder engine with the cylinders cast in pairs and set in a V of 90 degrees. The engine is placed under the floor of the cab and drives direct without any clutch through a tubular propeller shaft with universals to the worm-driven rear axle. An emergency gear reduction 3.5 to 1 is provided, making the total gear reduction to the rear wheels 41 to 1. The final drive is taken through radius rods and the torque through the springs.

The water is carried in a transverse tank under the driver's seat and is fed, by a special worm-driven boiler feed pump; to a horizontal water-tube boiler carried in a crosswise compartment behind the driver's seat above the floor.

The boiler is fired by kerosene, which is also carried in a tank under the driver's seat. A large condenser is mounted in the place of the usual radiator. Its makers claim that one of the truck's main advantages is the low cost of fuel.

Another claim is for a great tractive effort in starting, it being said that the truck has an available torque of 13,200 lb. in., making a maximum available torque for the rear axle drive shafts of 45,100 lb. ft. or a tractive effort of more than 12,500 lb., which will far exceed the friction between the wheels and the road, even when the truck is fully loaded.

Analyzing Body Design at New York Passenger Car Show

Close-Coupled Touring Bodies Are Prominent—Light Colors and Color Combinations Are Popular—Many Minor Refinements

By George J. Mercer

BOTH Madison Square Garden and the Sixty-ninth Regiment Armory may be termed "body shows" in the sense that while there may be nothing startlingly new there are many very good-looking jobs and a high average of uniform excellence, design and workmanship is evident.

Small, close-coupled touring bodies are very prominent. These are designed to carry four or five passengers, have no extra seats and are fitted with four doors. Body sides are lower and the adoption of the bevel top edge accentuates the low effect. Straight lines give a clean cut, well defined contour and give a pleasing air of definiteness. It should not be assumed that finality in body design has been reached in this type, the ability to produce something new is far from being exhausted and there is still opportunity for enterprising designers.

There are three distinct points in connection with these bodies which afford great possibilities to the designer: First, the carrying of the body line forward across the cowl; second, the blending of the back line of the cowl with the body side, and, third, the blending of the front seat back with the body line. There are numerous instances illustrating the different manner in which these may be carried out. Some are excellent—some are not so good.

In the case of the first point, the effect is always best when the line of the top of the body side is continued through to the radiator. Sometimes this is accentuated by a paint stripe which looks well, but it should be a straight line, although it may deviate at the rear of the body. For instance, on a runabout it may drop downward and on a touring body it can go upward, but for the major part of its length, and especially at its front end, it must be straight.

It is not easy to explain the second of the three points clearly. Briefly, the line of the back of the cowl should join the top line of the body without being abrupt. An angle is better than a radius, but the best results are obtained when the line of the cowl is curved, making the meeting of the two lines at a tangent so that the cowl line blends easily.

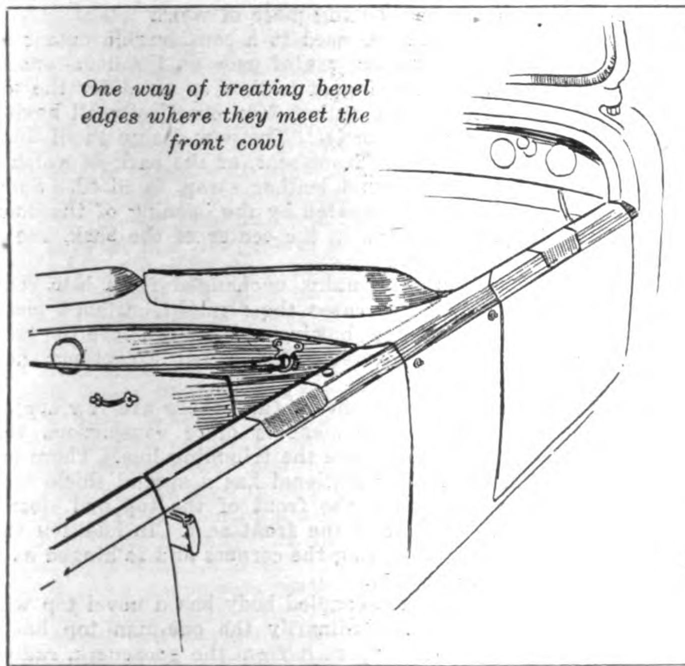
More thought has evidently been expended on the third point, although it has been difficult to illustrate many of the good effects by means of the sketches reproduced. The Paige is a typical instance. It is one of the newest, and has merit, as it permits the use of any form of second cowl or seat-back to fit to the body side without destroying the continuity of the latter. Good results can be obtained when the second cowl is a continuation of the bevel of the top line of the body side, but conditions must be favorable to assure relative perfection, as in the case of the Westcott.

The Essex has square rear corners. These look well on a short body and are favorable for fitting the guards to the body side. A finish panel covers the back end of the chassis frame and the gasoline tank. The Daniels small touring body has a platform at the rear which is used for a trunk.

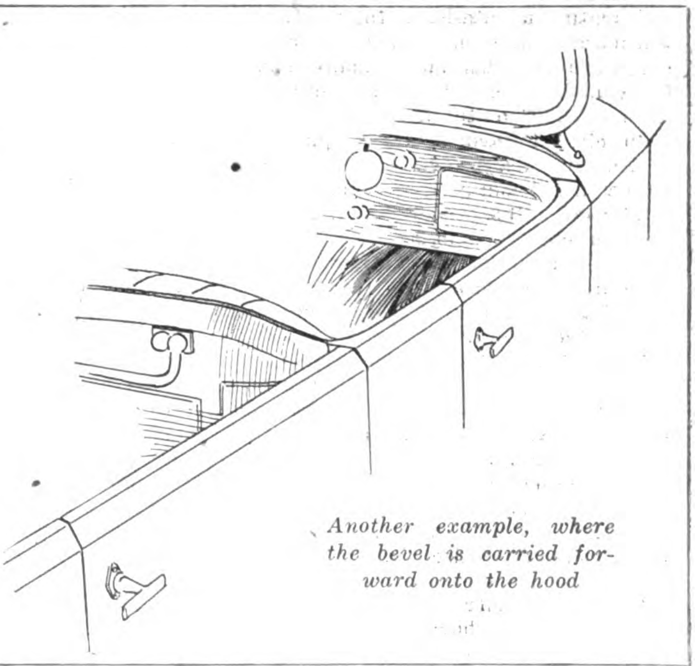
The idea of having a body as long as the chassis is seemingly going by the board and indications are that short bodies will become more popular than ever before.

Although body sides are as low as is possible while retaining comfortable seating, the hoods and cowls are kept up, undoubtedly for the reason that it adds to the snappiness of the car when these parts possess a relatively good bulk. They then convey the impression that the motive power of the car is ample. There are instances, however, in which this idea is exploited to an excessive degree.

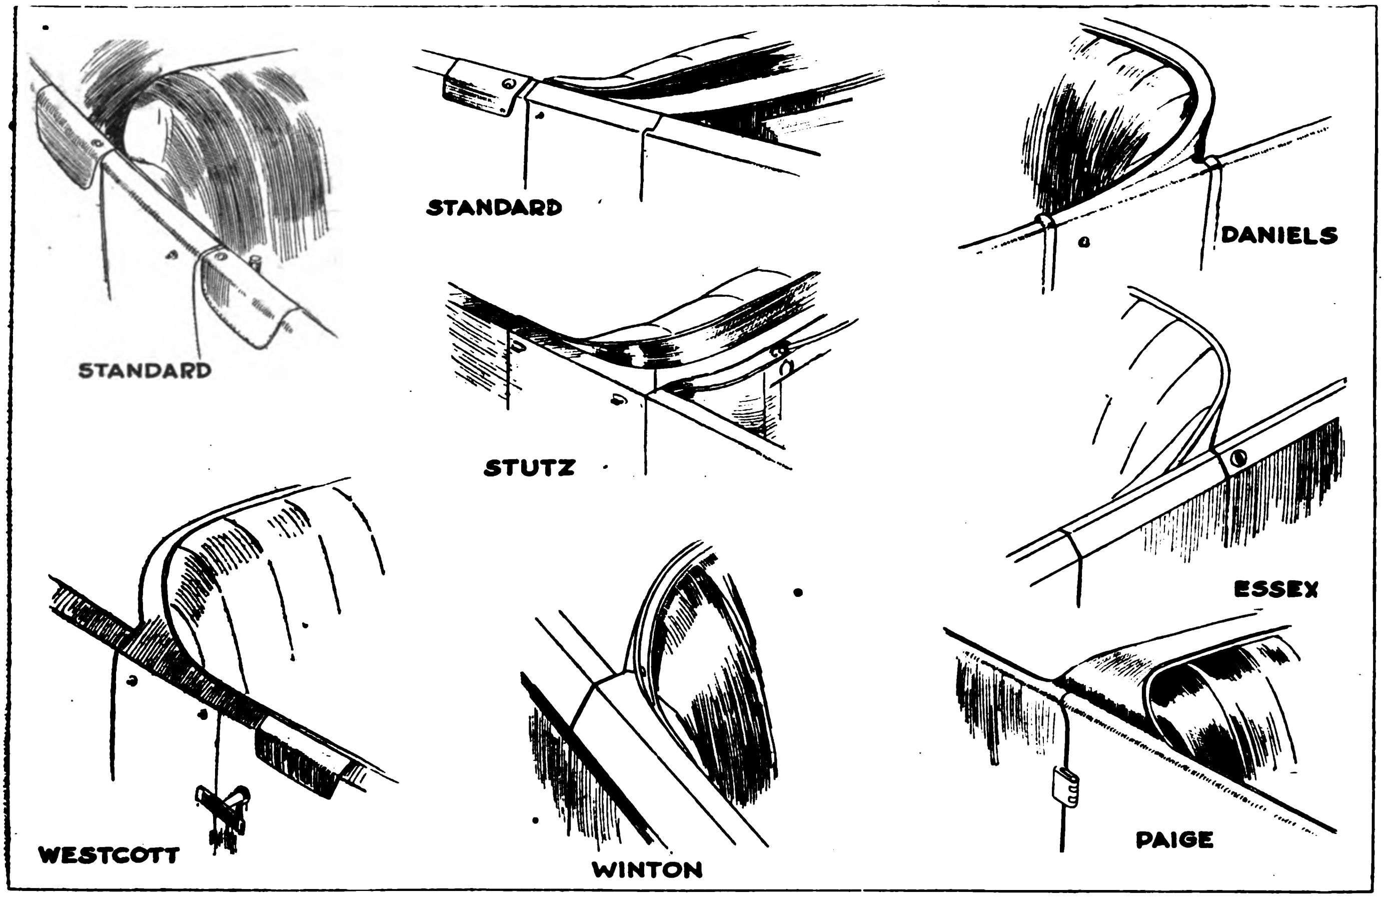
The hood at the dash must not be greatly higher than at the radiator; in fact, this line looks best when it slopes mod-



One way of treating bevel edges where they meet the front cowl



Another example, where the bevel is carried forward onto the hood



METHODS ADOPTED IN BLENDING THE CENTER COWL WITH THE BODY LINE

Good results are obtainable when the second cowl is a continuation of the bevel of the top line, but unless conditions are favorable it is difficult to make a perfect job

erately downward toward the front. This rule also holds good for the effect across the hood when the straight line of the body is continued forward to the radiator. The center of the hood does not look right when its height is accentuated above the corner line on the sides.

The advent of this small four-passenger body will result eventually in the disappearance of the four-passenger runabout types for the reasons that it is more sensible, more comfortable, is built on lines which are standard and is less subject to criticism as a freak.

A feature of interest is the great number of bodies without ventilators either in the sides or on top of the cowl. Many bodies are so fitted, but in many instances the lower part of the windshield is relied upon for ventilating the interior of the front part of the body.

An element favoring the sought-after low effect is the use of wire and disc wheels of 32 in. and 34 in. diameter. The former are strongly in evidence and are generally painted a light color. Disc wheels are numerous and look best when the disc part is painted a dark or solid color. This method reduces the size of the metal center and gives a better balance in appearance. One car is fitted with wheels having discs finished in nickel, which have the effect of making them appear too large in relation to the tire.

This latter instance tends to emphasize the fact that it is not always safe to apply conditions which are all right in a given place to another part without giving consideration to the effect. Nickel radiators look well, as do windshield frames and headlights, but when applied to wheel disks the result is not altogether happy. In this connection the accompanying illustrations show that the round Rolls-Royce type of headlight has many followers. These are usually finished in nickel and vary in size from the large type on the Rolls-Royce to those of average diameter.

There are plenty of good fenders. Those of the Packard and the Daniels show particularly well for the rear. They come well down and give the appearance of actually encircling the wheel. Brooks-Ostruk has one car with cycle fenders and steps without runboards. This body is on a Pierce-Arrow chassis with a new round-topped radiator. The body is a combination sport type on Rolls-Royce lines, attractive on account of its unusual lines and of excellent workmanship and finish.

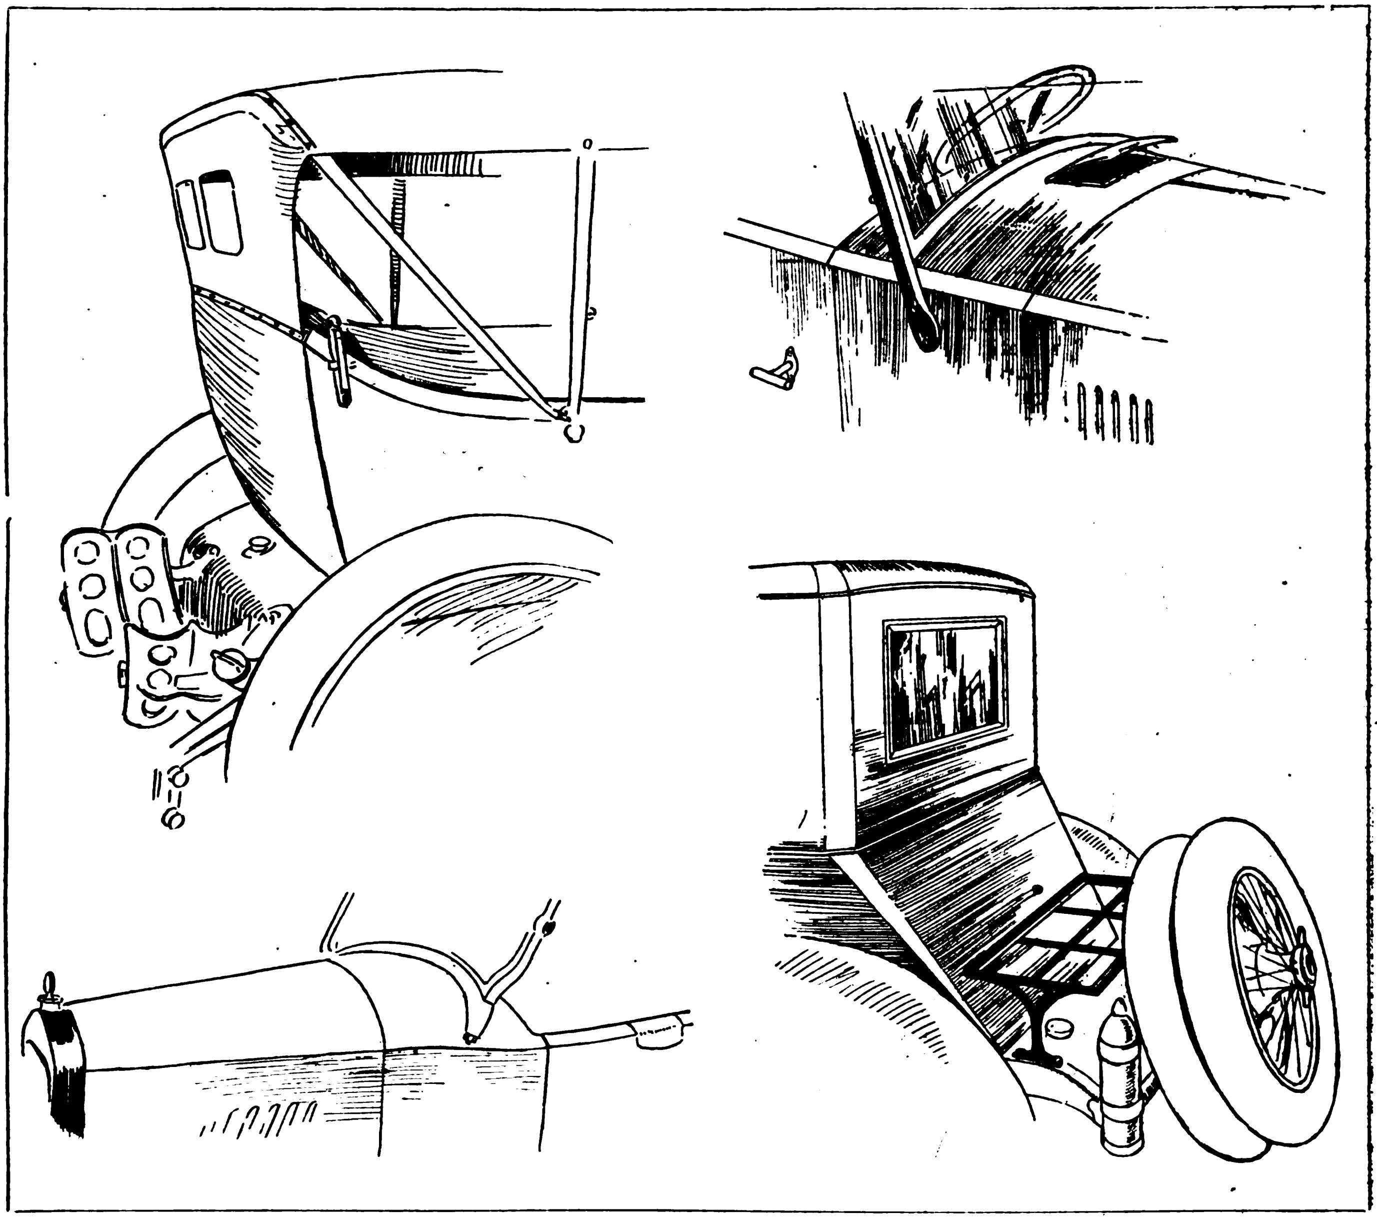
Louvres on engine hoods are long and narrow in many cases, and for the most part lack the exaggerated appearance of former years. A novel type is that of the Winton, the formation to make the louvre being inward instead of outward. Consequently the line of the hood side is flat on the outside, making a clean-looking piece of work.

Outside door handles are used to a considerable extent on open bodies, eliminating the use of pads on the door-tops to facilitate closing. Trimming of leather or wood for the top finish of the sides is used by but few, practically all having clean-cut lines of painted metal. The new design small touring body has an unbroken front seat, at the back of which a robe rail, generally a round leather strap, is fitted. Some bodies have step lights operated by the opening of the door. As these lights are located in the center of the back, one is sufficient for both doors.

Upholstery trimming remains unchanged from last year. In the great majority of cases the straight, stitched pleat, finished with welt and not showing noticeably above the back seat line, is the style affected. One or two exceptions show a single row of buttons.

Where one-man tops are fitted (and there are few special tops) the gooseneck attachment is quite conspicuous this year, coming completely above the trimming line. There are a few victoria tops. One National has a special shield with celluloid lights connecting the front of the top and closing the space from the back of the front seat. In addition this shield has side wings forming the corners and so hinged as to facilitate entrance or exit.

The Pierce-Arrow close-coupled body has a novel top with several good features. Ordinarily the one-man top has a cluster of bows which support it from the gooseneck, radiating from this center with the forward one of the group con-



Left, top—The flat back and square corners of the Essex tend to give the effect of a long body. Top, right—Treatment of the Essex body, showing continuation of bevel along cowl. The lower sketches show a method of connecting the body edge to the hood and a treatment which involves running out the body bevel to the rear

siderably ahead of its supporting point. On this individual body the forward bow is straight up and the quarter thus formed is closed with a curtain. This form of construction results in giving the job an excellent appearance.

The interior appearance of these open bodies gives an idea of comfort and the general appearance is in good taste and in conformity with the color scheme. For the most part, light colors prevail on open bodies, low-tone grays, coffee and black, green and cream under gear and black fenders are some of the combinations which look well.

As a matter of fact, all the color combinations are in good taste except the reds and the reds and yellows. These bodies look best in cases where, when two colors are used, the dividing line occurs at the chassis—that is, the body one color and the chassis and fenders another.

Painting the hood in two colors seldom looks well, the one "best" way of insuring a distinctive appearance being to have the radiator nickeled. If, in addition to this, the headlights and the windshield are also finished in nickel, the combination adds more snappiness to the car than all the paint in the world. Striping is used to some extent on the higher-priced cars, and it is worth its cost. It dresses up the painted surface and gives it a character that is appreciated when two cars, one striped and one without stripes, are placed side by side. There are but two cars with the dull finish paint which was common a few years ago. The majority have that varnished surface which shows off the shape and design of a body to the best effect.

Closed bodies include examples of all the jobs that have been on show in previous years, with the high-priced special bodies in larger number than ordinarily in proportion to the total exhibit. There are a number of attractive cabriolets, the large radius corner of the top at the rear being modified on quite a number. The designing of the top of the driving seat is better than usual. Brooks-Ostruck have a Rolls-Royce chassis with English line body, and Packard exhibits one with the modified roof corner. Holbrook shows a body with six fenders and steps. This is a sensible fender design, as it provides for the effective protection of the step by having a large flap hanging from the front fender.

The Marmon cabriolet possesses good color combination, and here it may be mentioned that the front seat cushion should always be divided as on this body. The reason for this is that it enables the driver to have his half built up to suit, leaving the other normal. Another reason is that in filling the tank or when gaining access to underneath seat the half cushion can be laid over on the other side in of being removed to the floor.

Only two of the town cars have pillar lamps, and there are but few dash or cowl lamps among all cars. It is true of closed bodies as of open that there are fewer ventilators in the cowls, windshields being made to do duty as ventilators to the front compartments. Windshields on enclosed cars are of regulation design. A few have double upper visors, but this is not generally the case.

There are several really good coupes. This body design is usually a factory standard and therefore does not come in the special design class. With the present trend for smaller bodies of all kinds it would seem that the small two or three-passenger inside drive body merits more attention than has been given it in the past.

Modern bodies of this kind are made with a window on the side, back of the door, and sometimes the division pillar is taken out and the entire side is open. As the top is so light, the criticism that the roof weight may break the pillars cannot be sustained against this type of body as may be the case with the large, seven-passenger jobs. Therefore it would seem that this type of body will become popular.

There is about the usual proportion of convertibles, identical in design with those of former years. The offset door type is the most popular of these, as it eliminates the necessity for crowding past the occupants of the rear seat.

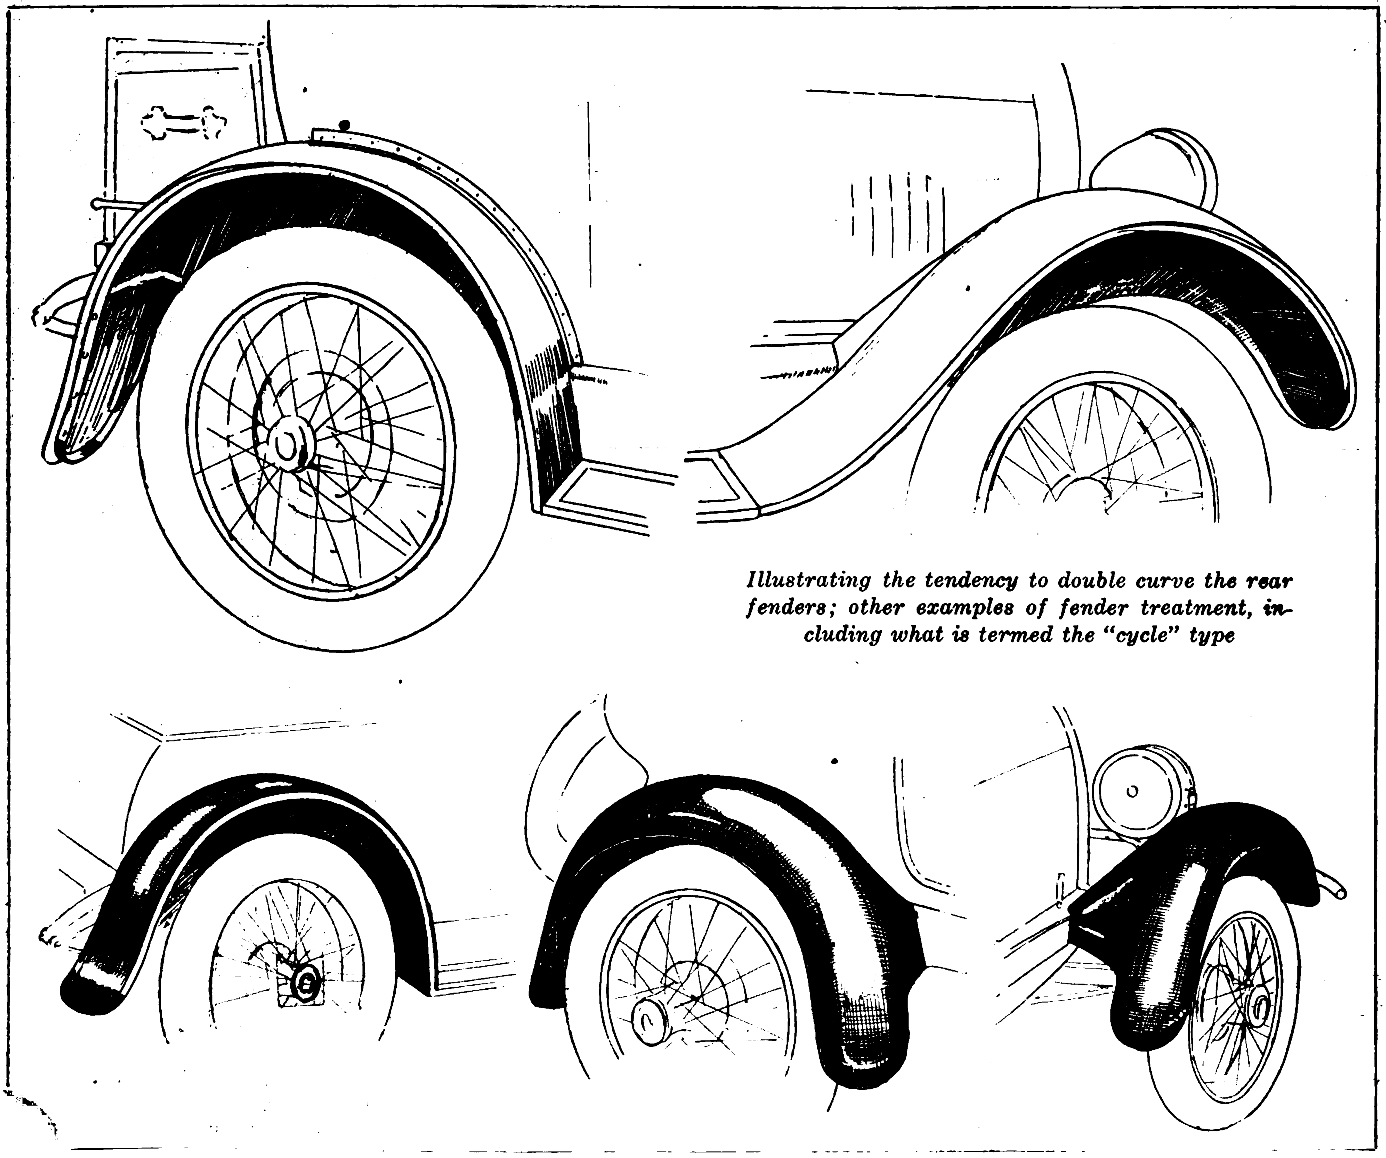
Wire wheels are used largely on closed as well as on open bodies. When wood wheels are fitted they are frequently painted a light color or given a natural finish, giving a light appearance to the car. Some few of the bodies have square rear corners, showing that the old horse-carriage style of body still has a faithful following. One closed body has cubist corners, a style which has had examples at shows for the past three years, but not in increasing numbers. It simply is different from the regulation line without being an improvement and it looks better when painted in light colors.

There are no new features in construction. In rare cases doors are made with tee mouldings, overlap panels covering the door openings in most instances. This is not generally considered the best practice, but it is the most practical, as it requires more careful workmanship to make the door flush and have a uniform opening all around. On the higher-priced body work the flush door is used, but the difference in the two methods is really more noticeable on open bodies than on closed types.

Trimming on closed bodies is plain in pattern and color of material. Quite a number use velour material of somber color. Plain pleats are used uniformly, with shaped arm rests for the rear seat and pockets on the doors.

Paint is uniformly brighter than usual and a few cars give evidence of an unfortunate selection of the dividing line for the changing from one color to another. When two tones are used on closed bodies the dividing line is best when horizontal and at the belt is best for most colors. One National sedan has a nice blending of two blues, using the belt and continuing the two colors on the hood and to the fenders. This made an attractive combination. A town body on which similar colors were used with a perpendicular dividing line was a less fortunate effort.

Striping is executed very nicely on many of the light blue cars, in some cases two colors being used for the striping as well as for the body.



Illustrating the tendency to double curve the rear fenders; other examples of fender treatment, including what is termed the "cycle" type

Production of Le Pére Planes Was Well Started

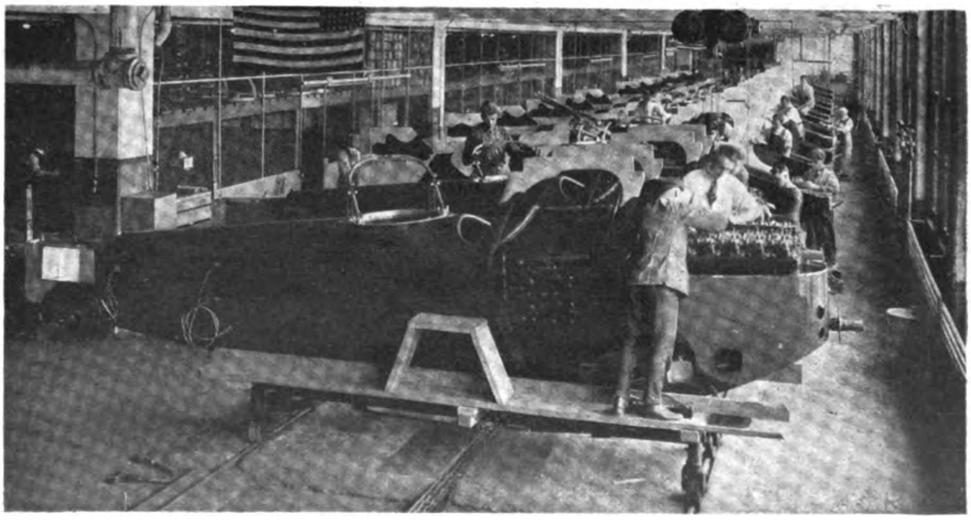
This Machine, Built in the Packard Plant, Is a Better Climber and Has a Higher Ceiling Than the D. H.-4—Excels in Detail Fittings

By J. Edward Schipper

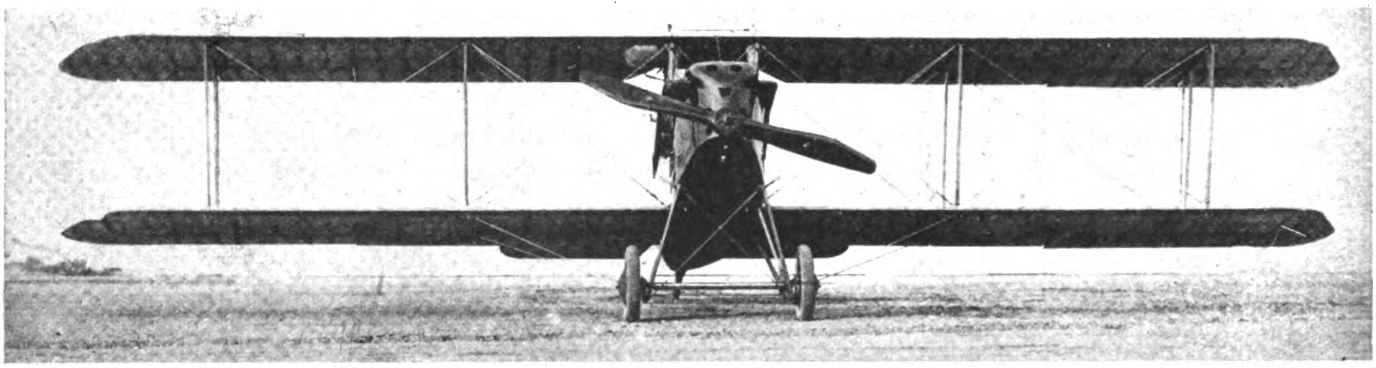
JUST a few months before the armistice was signed Captain Le Pére and the French Aviation Mission of which he had charge evolved a plane which is recognized to be the most efficient two-seated fighting machine yet developed. Frequent reference has been made to this plane in the columns of AUTOMOTIVE INDUSTRIES. The first 1000 planes had been started through production and a number of them were completed.

This plane, as developed by the French Mission, was purely a two-seated fighting machine, designed particularly for the Liberty engine. It was brought over here by the French Mission in embryonic form and then developed around the Liberty engine. As manufactured to date, this machine did not have a bomb-carrying or photographic attachment, being designed exclusively for fighting. It is in many respects an improvement over the D. H.-4. Owing to its lower weight—partly due to its construction and partly to the elimination of bomb-carrying and photographic features—it has a faster climb than the De Haviland and also a higher ceiling. It maneuvers better and it is also a better production job than any plane of its class.

A number of novel features, particularly as regards construction, appear in the design of this plane. These are apparent from the exterior photographs shown here-



Assembling Le Pére planes at the factory of the Packard Motor Car Co., Detroit



Front view of the Le Père plane designed by the French Aviation Mission and built at the Packard factory, equipped with the Liberty engine

with. Probably the most noticeable feature is the new type of strut construction, in which a continuous unit is employed to form the front and rear members of the strut. This is a naturally rigid form of construction, and one which increases the strength without interfering with the streamline construction. A considerable stagger is used, which gives a much greater range of vision than is obtained on the D. H.-4.

The machine-gun mounting is the same as that used on the D. H.-4, but the seats for the pilot and observer are so located as to concentrate the weight of the passengers and powerplant, thus increasing the maneuvering qualities of the plane to a marked extent. Captain Flachaire, the noted French ace, who was in this country during the past summer and fall, stated that this machine was one of the best to handle that he had ever driven. He was able on his first flight to put it through a series of flying feats which are generally possible only with a smaller machine.

This plane is also faster than the D. H.-4, which is probably due to the better streamlining. Some credit for the better performance is given to the stagger of the wings, but this is not fully settled. The plane has exactly the same wing area as the D. H.-4, although the load distribution is entirely different.

On the sand test this machine shows a factor of safety of eight. The spruce veneer work is unusual, particularly as regards the landing gear, which may be seen from the illustrations of the plane herewith. This plane excels in its detail work, and the fittings are particularly well designed. The inter-strut bracing fittings are very strong and yet do not break the streamline of the wing surface.

The plane was developed by the French Aviation Mission and was being built at the factory of the Packard Motor Car Co.

Performance of British Airplanes

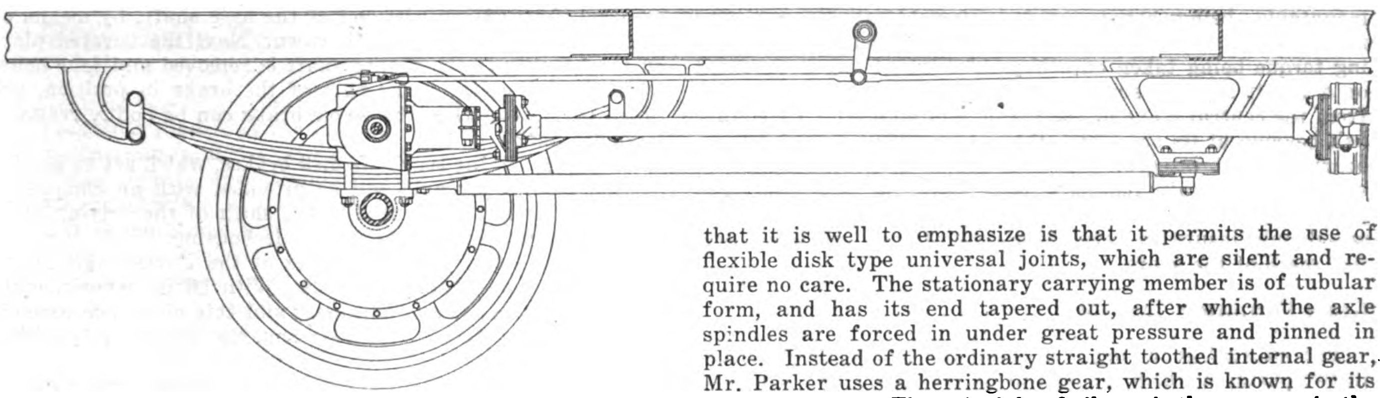
MANY new types of airplanes were developed in Great Britain during the war, designers constantly striving to produce machines that would excel those of the enemy in performance. This necessitates constant experiment and alterations, and complaint was sometimes heard that production was seriously interfered with. The following table shows the performance of the leading British types. (At lower altitudes the machines will, of course, develop higher speeds):

Machine	Speed at 10,000 ft.	Time Required to Climb 10,000 ft., minutes	Continuous Flight Capacity, hours
F.E. 2B	76	40	3½
Vickers Fighter	76	40	3½
Sopwith 1½ Strutter	103	10	...
Bristol Scout	111	10	1¾
A.W.	88	27	3
Sopwith Camel	118	10	2½
D.H.-4	120	11	4
D.H.-9A	120	11	6
Bristol Fighter	113	11	3
S.E.-5A	126	10	3
Dolphin	128	8¼	1¾

Final steps in assembling the Le Père plane at the Packord factory

Parker Silent Internal Gear Axle

Internal Gear Completely Inclosed and Running in an Oil Bath—Raybestos Disk Brakes on Driving Shafts—High Ground Clearance and Ready Accessibility Features



ONE of the great engineering problems of the times is that of the best final drive for commercial motor vehicles. For passenger cars the bevel gear drive is now about universal, but for commercial vehicles some form of double reduction must be used, unless resort is to be had to the worm drive. Whatever the ultimate type of final drive may be, there can be no doubt that it will be noiseless in operation and completely inclosed, so as to permit of effective lubrication and the exclusion of dust and grit from its bearing surfaces.

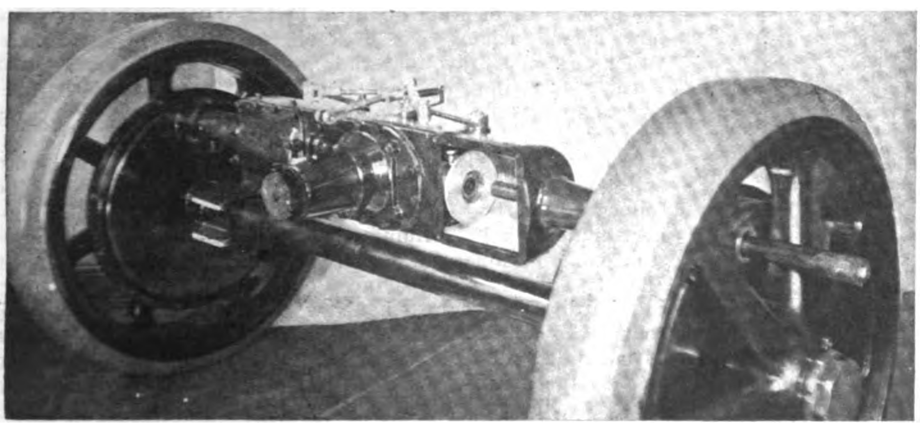
It is the attainment of these two qualities—silent operation and thorough inclosure—which has been aimed at particularly in the design of a new truck axle just brought out by the Parker Axle & Products Corporation of New York, of which Clark W. Parker is the organizer. The Parker axle is of the internal gear type, but it differs in almost every detail from previous axles of this class. Like other internal gear driven axles, it comprises a stationary carrying member, and a driving member supported thereby, carrying at its ends the pinions meshing with the internal gear rings on the wheels themselves. While in all, or at least nearly all, previous internal gear driven rear axles the driving member has been located either in front of or behind the carrying member, in the Parker axle it is located on top of it, the object of this change from conventional practice being to secure a straight line drive.

It is not necessary here to dwell upon the advantages of the straight line drive, as they are well known, but one point that it is well to emphasize is that it permits the use of flexible disk type universal joints, which are silent and require no care. The stationary carrying member is of tubular form, and has its end tapered out, after which the axle spindles are forced in under great pressure and pinned in place. Instead of the ordinary straight toothed internal gear, Mr. Parker uses a herringbone gear, which is known for its silent operation. The principle of silence is the same as in the well known helical gears now so much used for camshaft operation, but the herringbone gear has this advantage over the helical gear that it does away with end thrust in the shaft.

In former designs of internal gear driven axles, the gear reduction has been obtained in two steps, a first reduction at the center of the axle and a second one by the internal gear sets at the driving wheels. Mr. Parker uses a pair of miter gears at the center of the axle and obtains his whole reduction by the internal gears at the wheels. This makes the driving member of his axle a comparatively high speed device and permits of using a small differential and small axle shafts.

Oil Cooled Disk Brakes

The most striking innovation in the new axle is the brakes. These brakes are of the disk type, and are located on the differential shafts. The brakes comprise an internally splined drum which is securely held in the housing of the driving member and an internally and externally splined sleeve, which is in driving connection with the differential shafts. One set of metal disks is threaded upon the splined sleeve, and the other is threaded into the splined drum. The metal disks are not the ordinary flat disks, but are of composite construction, comprising two flat disks separated by a radially corrugated disk, which affords passages for oil from the center of the brake to the outside. Between the metal disks are located Raybestos disks, which may either be secured to one set of the metal disks or allowed to float.



Three-quarter view of Parker axle

The brakes are engaged by compressing the disks endwise, or in an axial direction. To this end the innermost disk is provided with a tubular extension formed with a groove for the shifting collar. The brake operating mechanism is of an ingenious design, combining a toggle device for multiplying the effort of application and an equalizing device, by means of which the pressure is equally divided between the two brakes. The toggle links are in the form of turnbuckles, and permit of quick adjustment of the brake linkage. A coiled spring acting at the center of the toggle moves in a guide slot, which prevents one of the brakes from being engaged automatically when the truck slopes sideways. It is, of course, necessary

to keep the toggles adjusted in such a way that the guide pin enters the slot substantially centrally. Not only is this adjustment very easily accomplished, but there should be very little occasion for readjusting the brakes, as the latter have an enormous surface in proportion to the work they have to do, and the oil circulation which is maintained also tends to keep down heating and wear.

For radial bearing loads, use is made in the Parker axle of Hyatt flexible roller bearings, while in points where thrust loads are to be taken care of the New Departure double row bearing is used.

Hollow spoke cast steel wheels are a distinguishing feature of the Parker internal drive rear axle. These wheels are demountable, being bored out to a considerable taper, and forced over a corresponding taper of the wheel hub, the driving torque being taken on a key. The wheel hub is mounted on a Hyatt roller bearing at the inner end, which is not far from the central plane of the wheel, and on a New Departure ball bearing at its outer end, this latter acting as a steadying bearing. Cast integral with the hub is a driving flange to which the internally toothed driving gear ring is riveted. The gear ring being riveted directly to the driving flange on the wheel hub, insures a very rigid support, and continued perfect mesh of the gears.

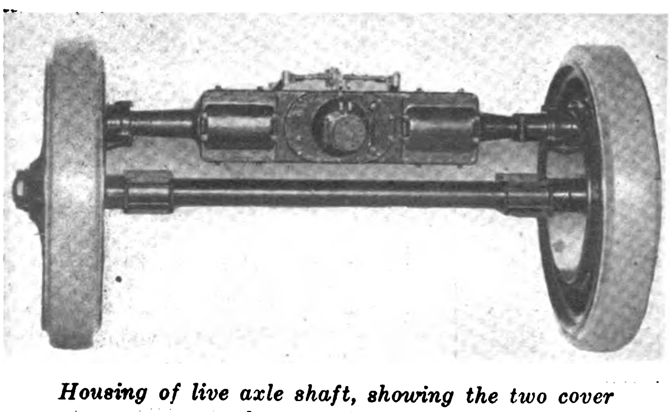
Gears Completely Inclosed

The internal gear ring is surrounded by a housing formed in two parts, of which the part away from the wheel is a casting which also forms the bearing support for the differential shaft. The part close to the wheel is a sheet metal stamping which is flange-bolted to the cast part, and which closely follows the outline of the driving flange carrying the internal gear ring. This sheet metal housing at its inner edge is formed with a groove for packing material, insuring a dust-tight joint with the revolving wheel hub.

A most interesting feature of the axle is its circulating lubricating system. A certain amount (about a gallon) of lubricating oil is carried in the gear housing. Mr. Parker figures that at a truck speed of 5 m.p.h. the centrifugal force on the oil is sufficient to carry it around with the gear ring. The differential shaft is made hollow from the wheel end to a point where the brake is located and the oil will be forced through this shaft by the centrifugal effect upon it. At that part of the shaft where the splines for the disk brakes are located, a considerable number of radial holes are drilled in the shaft. The oil will be forced through these radial holes and by the centrifugal action through the spaces in the composite disks of the brake. After having passed through the brake, it collects in the housing of the countershaft, and when it reaches a sufficient level, it returns to the housing of the internal gear ring, a channel for its return being provided in the bearing hub of the differential housing.

Oil lubrication not only is more efficient than grease lubrication, but eliminates the need for a lot of attention usually required by a truck. On the Parker axle there is not a single grease cup or oil cup to be looked after. The only attention required by the lubricating system is that involved in the replenishment of the oil supply once or twice a year.

Special attention has been paid in the design of the Parker



Housing of live axle shaft, showing the two cover plates on front side

axle to requirements of accessibility and quick adjustment. The housing of the live axle shaft, within which the brakes are located, is provided with two cover plates on the front side, which can be removed quickly, and permit of the withdrawal of the whole brake. It is Mr. Parker's intention to provide these cover plates with small inspection holes, so that it is not necessary to remove the cover plates when it is merely desired to inspect the brakes. In order to permit of the removal of the brakes, the live axle shaft is made of floating design. There is a small covered opening in the gear housing opposite the shaft end, and when it is desired to remove the shaft, the wheel is first turned until this opening is between two adjacent spokes. Then the small cover plate is removed, and a screw inserted into the end of the axle shaft, by means of which it can be readily withdrawn. Next the covered plate on the housing of the countershaft is removed and four bolts, which hold the stationary part of the brake in position, are taken out. After this, the whole brake can be bodily removed from the axle.

In addition to the rear axle disk brakes, which act as service brakes, the Parker axle will be provided with an emergency brake, which will be secured to the shaft of the driving bevel pinion, where it enters the rear axle housing.

Not the least of the advantages of the Parker axle is the high ground clearance it affords. With 36 in. wheels, more than 16 in. clearance is obtained, and this clearance extends from wheel to wheel, as the gear housings are entirely within the wheel.

The Parker Axle & Products Corporation has only recently been incorporated, and will immediately begin operations. The first axle design is a 2-ton type and embodies the Hotchkiss drive principle. The spring pads are formed integral with the hub of the driving gear housing on which the torque reaction comes, consequently the torque is transmitted to the rear springs in the most direct way possible.

Owing to the fact that the weight carrying member of the axle is of tubular form, and that the countershaft operates at high speed, the unsprung weight is comparatively small. This is of importance on account of the effect of the unsprung weight on tire wear. The cast steel wheels are of Mr. Parker's own design. Owing to the principle of detachability involved, the customer can be given an option between single pneumatic, twin pneumatic, single solid, twin solid and plain steel rim wheels, all being interchangeable.

Coming Developments in the German Iron Industry

HOW German engineers and manufacturers propose to deal with the new difficulties of industry consequent on the war is shown by the report of the managing director of the Iron Founders' Association read at the general meeting in Berlin on Sept. 14 last:

The report says in effect: The scarcity of raw materials will continue far into the years of peace. We must, therefore, prepare for an intensive use of materials and human intelligence. With our instructive experience in wartime in mind, we must apply the latest scientific knowledge to the problems before us, to smelting, casting and cooling, and to the production of other qualities by the use of new alloys, and new means arising out of increased chemical knowledge. Other forms of raw material, more economical methods of burning fuel, improved construction of furnaces, more effective temperatures, these invite research and suggest progress in new directions. The Kaiser Wilhelm Institute for research in iron has been founded to deal with these problems, and a sister institute for research in other metals is soon to follow. From both these the iron founders' industry is hoping for much help. Aluminum and zinc in their various possible combinations will replace copper and nickel and their alloys. The future importance of these metals for Germany can hardly be over-rated. New forms of construction will reduce the consumption of the rarer metals for certain parts of machines. The iron founder will look to the chemist to remedy the evil of a lack of hematite. A number of German blast furnaces are already prepared to use the phosphorus-free ores of Scandinavia and other countries in place of the supposed indispensable hematite.—*Giesserei-Zeitung.*

Standards Committee Acts on Division Reports

New Ball Bearing, Electrical, Engine, Spring, Tire and Rim and Miscellaneous Standards Recommended—A Few Items Referred Back to the Divisions

EIGHT divisions of the S. A. E. Standards Committee presented reports at the meeting of the Committee held on Tuesday, presided over by Chairman B. B. Bachman. Most of the reports were accepted after little or no discussion, but considerable opposition was raised to the adoption of certain recommendations and some of the latter were referred back to the divisions. It must be understood that any recommended standard reported as adopted in the following is not yet an S. A. E. standard; before it reaches that state it has to be passed upon by the Society at the general meeting, by the Council and, through the instrumentality of a letter ballot, by the entire membership.

The first report read was that of the Ball and Roller Bearings Division, by Division Chairman F. G. Hughes. In this it was pointed out that with the broadening application of ball bearings it had become advisable to extend the Society's standards to include both larger and smaller bearings, and the Division had prepared tables of dimensions for both types.

Extra Large Type Ball Bearings

In the extra large types it was considered desirable to standardize series of sizes with dimensions progressing proportionately, as far as possible without conflicting with current practice. It appears that certain sizes of extra large ball bearings have already been put in production, but it is felt by the division that changes can be better made now than after these large size bearings have become more firmly established. The tables of extra large types recommended contain only the bores and outside diameters, leaving the widths and all tolerances to be decided on later. An extra small series of ball bearings are also recommended, these being intended for use in airplane sheave pulleys and special apparatus. The report also contains dimensions of separable (open) type bearings which are extensively used in magneto construction and other small types of machines. That part of the report dealing with the extra light series of ball bearings was intended as a progress report only and not for action by the Standards Committee at this time, as difficulties had been encountered by the Division in discussing the width of the bearings and further consideration was necessary.

An angular contact bearing is also dealt with in the report, and the recommendation is made to standardize this in three series, heavy, medium and light, the same as the regular annular ball bearings. It will not be necessary to print special tables of dimensions for this type of bearing, but instead the following note is to be appended to the tables of the regular annular bearings: "Ball bearings of the angular contact type are identical in sizes and boundary dimensions with S. A. E. Standard annular ball bearings in the light, medium and heavy series, as printed on pages 29, 29a, and 29b, S. A. E. Handbook, Vol. I."

Roller Bearing Majority and Minority Reports

Mr. Hughes stated that at the Dayton meeting of the Society a special sub-division on roller bearings was appointed, which had held many meetings since. All of the members of this sub-division with one exception signed a majority report to the Division recommending that the present S. A. E. standard roller bearing sizes, which are metric sizes, be retained. A minority report was made by Mr. Porter, of the Timken Roller Bearing Co., who was chairman of the sub-division, this report being to the effect that the Timken company would reduce the present number of sizes to make an acceptable inch standard. Mr. Manly made reference to a matter in connection with ball bearing manufacture which had given him a great deal of trouble. This was that the chamfer specified at the corners of the inner and outer races was put on during the machining operation and before the final grinding, with the result that when the races were ground the chamfer was reduced in amount. Assurance was given that this matter would receive the attention of the committee.

High Speed Ball Bearings for Aero Work

President Kettering of the S. A. E. called the attention of the Division to the fact that there would shortly be a demand for ball bearings for aeronautic work to run at very high speed, as from 13,000 to 18,000 r.p.m. These bearings were required in gyroscopic compasses and similar apparatus. A motion was made that the Division be requested to investigate the subject of such bearings, and was adopted, but it was later on pointed out by Chairman Hughes that past experience had shown that the Standards Committee must limit itself to standardizing the outside dimensions of bearings. No end of trouble was encountered if it was attempted to standardize the internal construction, as the Committee did not possess equipment for carrying on the necessary research work.

That part of the Committee's report which was presented in completed form, including a table of dimensions for annular ball bearings of the separable (open) type, the extra small series and the angular contact type, was adopted by the Committee.

W. F. Cole presented the report of the chain division. The only recommendation made to the Standards Committee, a matter of nomenclature, was that the standard roller chain designation be changed from "Universal No." to "Manufacturer's Standard No." This was adopted.

Sleeve Mounting for Generators

The report of the Electrical Equipment Division dealt with four items, viz., a sleeve type of starting motor mounting, cable terminals for ignition distributors, generators, meters and switches, non-magnetic magneto shims and flexible disk magneto couplings. There had been some criticism of the proposal to add another mounting to those already standardized by the Society, but it was pointed out that the machining operation for a flange mounting on the flywheel housing of a unit power plant was often a very difficult matter. The mounting recommended is already in practical use. Mr. Broege wanted to know whether the relation of the new mounting to the engine was the same as that of the corresponding flange mounting and was told in reply that it would be quite possible to use a new starting motor (that is, one designed for sleeve mounting) on an engine designed for the flange mounting, using the same flywheel and a suitably designed adapter. The proposed mounting was adopted by the committee. This mounting is to be used only for outboard mesh installations, as it is not considered a suitable type for inboard constructions. The mounting consists of a cylindrical portion of the gearshift housing sliding into a bored hole in the bell-housing, the length of which is about two-thirds the diameter of the bore. The motor is locked in position by a screw through the bell housing entering a tapered

hole in the cylindrical portion of the gearshift housing.

The next subject dealt with in the report, that of cable terminals, was referred back. In regard to non-magnetic magneto shims, which subject was taken up last year, the Division now recommended that when it is desired to use a non-magnetic shim with magnetos mounted on cast iron pads, the shims shall be ½ in. thick, and high strength bronze bolts shall be used. The thickness of the shim is to be added to the dimension given in the mounting drawing for the distance from the face of the mounting pad to the center of the magneto shaft. It is suggested that a grid construction be used for the shims. This recommendation was adopted.

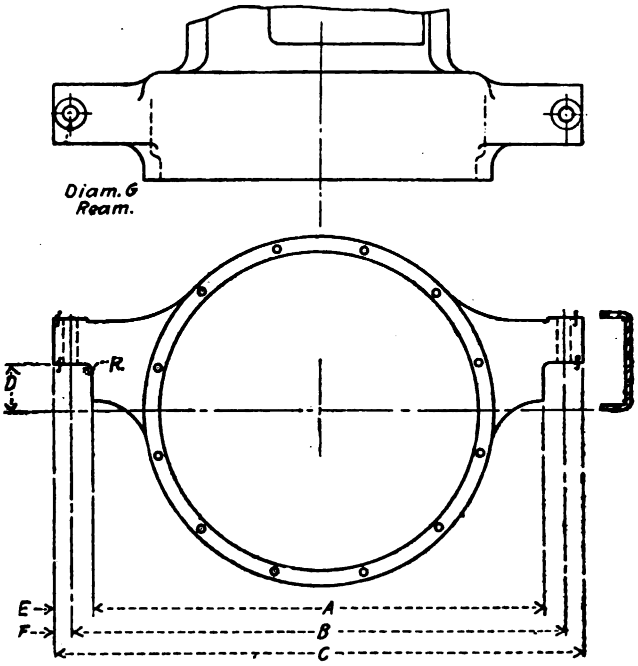
Dimensions are also recommended for flexible disk type magneto couplings, as follows: Outside diameter of disks, 2¾ in.; inside diameter of disks, 1 in.; diameter of bolt circle, 2 in.; thickness of disks, ¼ in.; number of ¼ in. bolts equally spaced, 4. These recommendations are complementary to the driving shaft and coupling dimensions printed in the S. A. E. Handbook, Vol. I on pages 36 and 36xa. This recommendation was also adopted.

Engine Support Arms

W. A. Frederick read the report of the Engine Division, which made recomendations regarding standard engine support arms in two sizes, the large size for the No. 1 S. A. E. flywheel housing and the small size for Nos. 2, 3, and 4 S. A. E. flywheel housings. It was pointed out that further standardization to include the front rocker bearing is being considered by the Division. The standards recommended correspond to the dimensions of the engine support arms on the Class B and Class AA Army trucks, respectively.

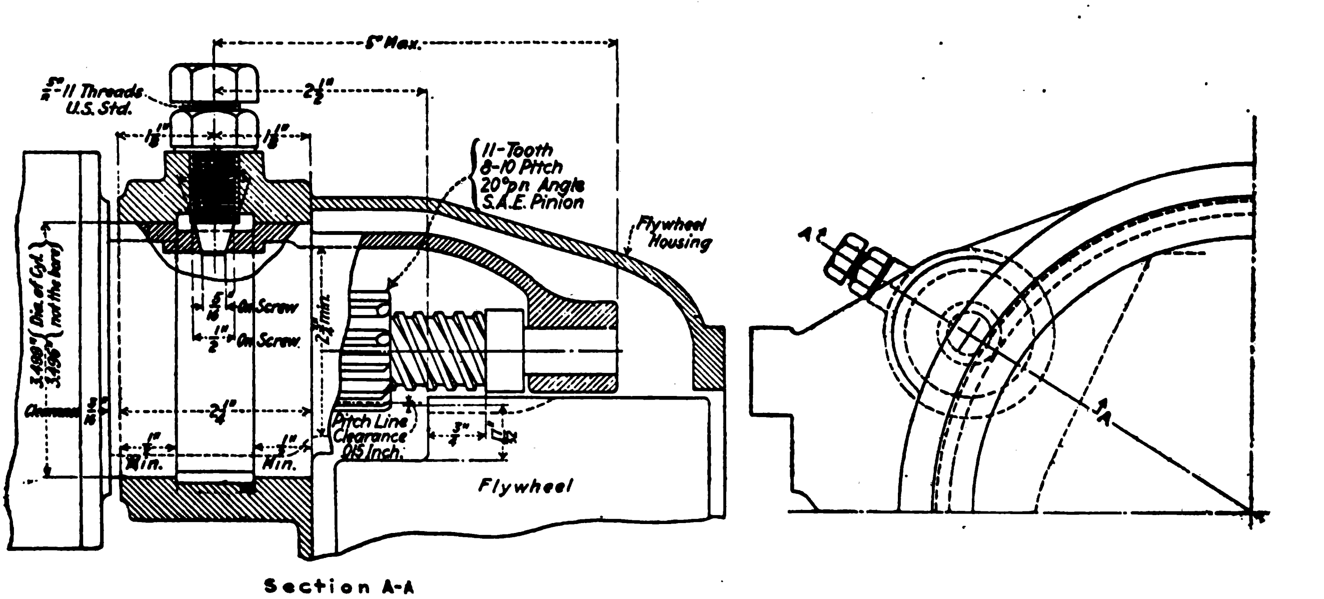
A letter from A. L. Riker was read in which objection was made to the adoption of the proposed standard. Mr. Riker said that the mounting suggested would not permit of supporting the engine direct on the main frame but called for the use of a sub-frame and its adoption therefore would favor sub-frame mounting. Replying to Mr. Riker's criticism, Mr. Frederick pointed out that the support was intended for both passenger cars and trucks. It had been found entirely impossible to standardize support arms for mounting engines directly on the main frame as the height of the engine relative to the frame varied considerably and so did the widths of frames. The arms could be used for mounting the engine on a sub-frame, or if main frame mounting was preferred, engine support brackets would have to be used. The report was adopted as presentd.

F. P. Gilligan read the report of the Iron and Steel Division which contained a suggestion for a new steel castings standard. The Society already has a standard for the composition of steel castings and the adoption of the new specification would amount to a revision of the old standard. The recommendation was made with the desire of correlating the several existing steel casting specifications which differ but slightly from each other. The A. S. T. M. specification has already been practically adopted by the Ordnance Department, the Navy and the Steel Founders Society of America. The recommendation was to the effect that the carbon in steel castings might vary as required in view of the physical properties demanded, but that the phosphorus and sulphur contents should not exceed 0.05 per cent each. There was a footnote attached to this specification reading as follows: "In view of the abnormal difficulty in obtaining materials in time of war, the rejection limits for sulphur in all steels and for phosphorus in acid steel shall be raised to 0.01 per cent above the values given in these specifications. This shall be effective during the period of the war and until otherwise ordered by the Society." The report also contained notes and instructions referring to the material specified, but it was not intended that these should form part of the standard itself.



Engine rear support arms

S. A. E. Flywheel Housing	A	B	C	D	E	F	G	R
No. 1	23½	26¾	28¾	2	2⅝	1	0.750	7/16
Nos. 2, 3 and 4	23⅛	24½	25¾	2½	1 5/16	⅝	0.625	⅝



Sleeve mounting of generators

The suggestion to permit a higher percentage of phosphorus and sulphur in steel castings elicited considerable discussion, automobile engineers uniformly holding to the opinion that an additional amount of sulphur would be very objectionable, whereas the steel men present claimed that it had never been proven that sulphur had the deleterious effect on steel which it was generally imagined to have. Mr. Reese said that the matter of sulphur in steel was not so much dependent upon war conditions as upon fuel conditions. Natural gas and coal low in sulphur had practically disappeared and we could not look forward to a reduction in the sulphur content permissible. The manufacturers of steel felt that the conditions had not improved in the least. The Navy even allowed up to 0.08 per cent sulphur in steel castings.

Steel Castings Report Referred Back

In the discussion it was pointed out that the majority of steel castings used in the automotive industries were now made in the electric furnace and that there was no difficulty in keeping down the percentage of sulphur and phosphorus in this process. For steel castings made by the open-hearth process 0.06 per cent would be a very fair limit. After an extended discussion and in view of the fact that the American Society for Testing Materials will probably take up the matter at its meeting in March, the subject was referred back to the Division for further consideration.

E. H. Ehrman presented the report of the Miscellaneous Division, which comprised two items, namely, nuts for machine screws and aeronautic spark plug dimensions. Some opposition was made to the adoption of the recommendation for nuts for machine screws in a letter from former Standards Manager W. M. Hanks, who is now connected with the Navy in the capacity of aeronautical engineer. Mr. Hanks' objection was that these nuts, while in general corresponding to the S. A. E. standard hexagon nuts for aeronautic work, did not absolutely agree therewith and that this would lead to confusion. Mr. Hanks considered the adoption of this new standard an unnecessary multiplication of nut standards. In reply to this letter, Mr. Ehrman explained that there was a great difference between the nuts for machine screws here considered, which were generally manufactured by punching, and the S. A. E. standard nuts for aeronautical work which were produced from bar stock. There would not be the least interference between the two, and, in fact, the nuts for machine screws covered by the suggested standard were already being manufactured and the standard had the support of all of the machine screw makers of the country. One important difference between the nuts for machine screws and the S. A. E. standard nuts for aeronautic work was that the tolerance in the former was so great as to render them entirely unsuitable for aeronautical work. The table of dimensions recommended gave only the outside dimensions, and Mr. Ehrman stated that this standard would not be affected by any action that might be taken by the Commission for the Standardization of Screw Threads. Mr. Howard made the suggestion that the long diameter of the square and hexagon should be given in the table, but Mr. Ehrman thought it preferable that a table of long diameters of squares and hexagons should be published somewhere else in the S. A. E. Handbook. This part of the report was adopted.

Standard Nuts for Machine Screws

Thread Diameter No.	Thread Diameter Decimal	Short Diameter	Nominal Thickness
0†	0.060	[illegible]	[illegible]
1†	0.073	5/32	[illegible]
2	0.086	3/16	[illegible]
3	0.099	7/32‡	[illegible]‡
4	0.112	1/4	[illegible]
5	0.125	[illegible]‡	[illegible]‡
6	0.138	5/16	0.101

*			
24	0.372	11/16	5/16
*			
30	0.450	[illegible]	3/8

*Intermediate sizes are special—7, 9, 16, 22, 26, 28. Their dimensions are the same as for—6, 8, 14, 20, 24, 24.

†Made from bar stock only.

‡Unless made from bar stock, No. 3 and 5 will be made the same dimensions as No. 2 and 4 respectively.

Table gives all stock sizes for square and hexagon machine screw nuts of brass, iron and steel.

Aeronautic Spark Plug

A few changes were made in a dimension drawing of the aeronautic spark plug submitted. The aeronautic spark plug had been standardized already and the present recommendations are in the nature of a revision and an extension of the former standard. If adopted, the S. A. E. aeronautic spark plug will be brought into harmony with the international standard, and spark plugs of American origin will be applicable to British engines, for instance. In the design submitted slip terminals were shown for plugs for both stationary engines and rotary engines. Some objection to the design of the slip terminal was made by Mr. Crane, and as a result this part of the recommendation was referred back to the committee. The rest was adopted.

W. M. Newkirk read the report of the springs division which embodied quite a number of items, some of them intended for action by the Standards Committee at the meeting and others merely to indicate progress made. The first item had reference to leaf points. Two drawings were shown in the report, one of them showing leaf points which had been used in the past but now practically obsolete, and the other showing leaf points which are in common use to-day. It was decided by the Division, just before the meeting, to withdraw the first drawing and recommend the inclusion of only the latter in the records of the Society.

Leaf points Nos. 2, 3 and 4 are suitable for rolled tapered leafs and leaf points Nos. 4 and 5 are suitable for full thickness leafs. Rebound clips are to be used in all cases.

The present 3/16 in. value for angular variation of the eye center line is considered too close for practical vehicle spring

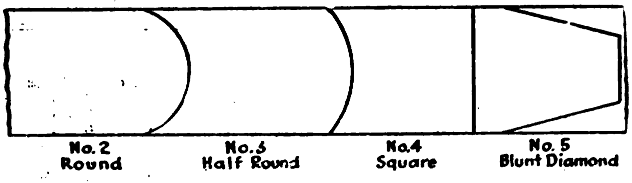
Aeronautic spark plug



New leaf points

tests, and the Division recommends that this be specified as ⅜ in. both ways for commercial vehicles, as shown in the accompanying drawing. The tolerances now specified for eye bushings and bolts are considered too close for practical application, and it is recommended that they be opened up to within commercial limits as follows: Bushed eyes—plus 0.001, minus 0.003; bolts for bushed eyes—minus 0.005, minus 0.008; unbushed eyes—plus 0.001, minus, 0.004; ground bolts for unbushed eyes—minus 0.006, minus 0.009; bolts of hot rolled stocks (not ground) for unbushed eyes—diameter minus 0.004, for maximum so as to use standard reamers.

An attempt was made to refer the recommendation regarding tolerances for spring parallelism back to the committee, but the motion was lost.

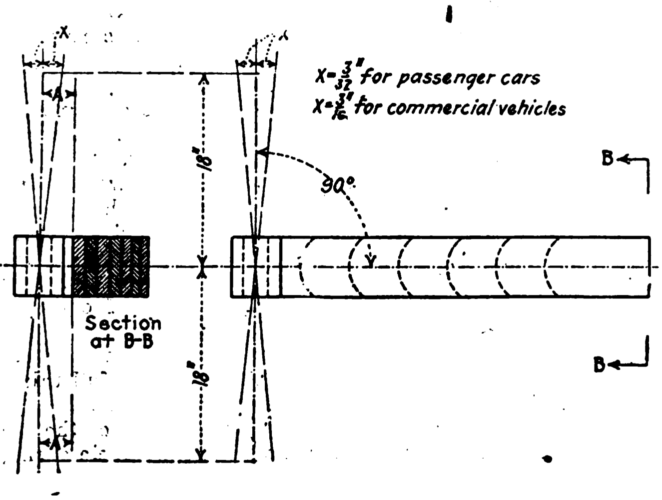
The Division also recommended that a paragraph in the S. A. E. Handbook reading, "The second leaf should not be wrapped around the eyes of passenger car springs," should be omitted. The effect of this is to broaden the provision of double wrapping, making it applicable to all kinds of springs.

In connection with the width of spring ends it was recommended that the tolerance be changed to 0.005 in. for passenger cars and 0.010 in. for commercial vehicles. In connection with frame brackets, the passage in the Handbook relating to this is to be extended to read: "the distance between the ears of bracket hoods should be 0.010 in. greater than the finished width of the spring eyes, with a minus tolerance of 0 and a plus tolerance of 0.005 in. for passenger cars. For commercial vehicles the minus tolerance should be 0 and the plus tolerance 0.010 in." A note is to be added to an item on rebound slips, spacers and bolts in the Handbook to the effect that "clearance between the rebound clip bolts (or spacer tubes if used) and spring plates shall not exceed 3/32 in. for passenger cars and 3/16 in. for commercial vehicles."

Recommended Spring Sizes

Two tables were given in the report, of spring widths and lengths, eye and clip diameters, for passenger cars and commercial vehicles respectively. It was stated in the report that these tables had been carefully reviewed and were in close accord with current practice. In the tables as originally formulated a definite spring width was given for each weight of passenger car and each capacity of commercial vehicle, but the Division in making its report revised these figures so as to give a certain leeway to the designer. The tables in the revised form are reproduced herewith.

All other matters in the report, including spring clips for passenger cars, spring bolts for passenger cars, spring bolts for commercial vehicles, spring pins for commercial vehicles



Passenger Car Springs

Shipping Weight of Car in Lbs.	Location	Approx. Load per Spring (With Passengers), Lbs.	Recommended Spring Length, In.	Spring Width, Inches	Eye Diameter (See Notes)	Spring Clip Diameter, Inches (Alloy Steel)
Under 2500	Front		38	1¾	[illegible]	½
	Rear		52	1¾–2	[illegible]	7/16
2500 to 3000	Front		40	1¾–2	[illegible]	9/16
	Rear		54	2	[illegible]	9/16
3000 to 3600	Front		40	2	[illegible]	[illegible]
	Rear		56	2 –2¼	[illegible]	[illegible]
3600 to 4200	Front		42	2 –2¼	[illegible]	[illegible]
	Rear		58	2¼–2½	[illegible]	11/16

The third sentence of the notes in the data sheet should be omitted and the following note added: "Heat-treated alloy steel spring clips shall be used in all cases.

Commercial Vehicle Springs

Capacity, Tons	Location	Spring Width (Inches)	Min. Length of Spring, Inches	Eye Diam. (See Notes)	Spring Clip Diam. (Alloy Steel): Spring Set on Axle	Spring Clip Diam. (Alloy Steel): Spring Underslung
¾	Front	2 –2½	40	¾	[illegible]	¾
	Rear	2 –2½	50	[illegible]	[illegible]	[illegible]
1	Front	2 –2½	40	[illegible]	[illegible]	[illegible]
	Rear	2¼–2¾	50	1	[illegible]	[illegible]
1½	Front	2¼–2¾	42	¾	[illegible]	[illegible]
	Rear	2½–3	54	1	[illegible]	1
2	Front	2¼–2½	42	¾	[illegible]	⅞
	Rear	3	54	1⅛	[illegible]	1
3½	Front	2½–3	44	⅞	[illegible]	1
	Rear	3 –4	56	1¼	1	1⅛
5	Front	3	44	⅞	⅞	1
	Rear	4 or 5	56	1¼ or flat end	1	1⅛
7	Front	3	46	1	1	1⅛
	Rear	5	58	1¼ or flat end	1⅛	1¼

The column "Capacity, Tons," is intended only to indicate the general truck capacities on which the corresponding usual spring sizes are used. The above table applies to all types of drives.

Heat-treated alloy steel spring clips shall be used in all cases.

and methods of greasing and oiling spring bolts were not in a form to be acted upon. With the exception of these items the report was accepted by the committee.

Quite an extensive report was made by the Tire and Rim Division, which was read by C. B. Whittelsey. According to this report, it was considered desirable to establish a definite S. A. E. standard list of solid tire sizes toward which all manufacturers could work. It was felt that such a list would also be of material value to the wheel builders as represented by the Automotive Wood Wheel Manufacturers Association. The new list contains the following sizes (together with the equivalent metric sizes): 32x3½, 36x3½, 32x4, 36x4, 36x5, 40x5, 36x6, 40x6, 36x7, 40x7, 36x8, 36x10, 40x10, 40x12 and 40x14.

Solid Tire Cross Section

Some work has also been done on solid tire sections. The first intention was to standardize the sections and contours for solid tires, but as this would tend to limit design the Division recommended that the minimum total cross sectional area of rubber on standard bands for commercial vehicles be as shown in the accompanying table, which is in accord with the schedule worked out and adopted by the Solid Tire Division of the War Service Committee of the Rubber Industry. These areas include the hard and soft rubber used in solid tires.

The recommended minimum cross sectional areas for different widths of solid tires are as follows: 3½ in., 6.75 sq. in.; 4 in., 7.75 sq. in.; 5 in., 10.75 sq. in.; 6 in., 13.75 sq. in.; 7 in., 16.75 sq. in.; 8 in., 19.75 sq. in.; 10 in., 25.75 sq. in.; 12 in., 31.75 sq. in.; 14 in., 37.75 sq. in.

Another recommendation concerned industrial truck tires. Investigation showed that there was little uniformity in the present practice, and after a careful consideration the Division recommended sizes of industrial truck tires and wheels as given in the table on page 311.

Wood Felloe Dimensions—Pneumatic Tire Rims

At a previous meeting the Society adopted dimensions for 6. 7 and 8 in. rims. To complete this specification, dimensions for 3½, 4 and 4½ in. rims were recommended as follows

Industrial Truck Tires

Tire Dimensions		Wheel Dimensions	
Nominal Diameter, In.	Sectional Widths, In.	Wheel Diameter, In.	Widths of Felloes, In.
10	3½	6	2¾
10	5	6	4¼
16	3½	12	2¾
16	5	12	4¼
20	3½	16	2¾
20	5	16	4¼
24	3½	20	2¾
28	3½	24	2¾

"Wheel diameters shall be 4 in. less than the nominal tire diameters. The height of the finished tire is to be 2 in. for all sizes. The width of the wheel felloe is to be in accordance with the present S. A. E. standard truck tire practice and the rim diameter tolerances will be plus 0.005, minus zero." The acceptance of this recommendation will make all the former or present S. A. E. standards for industrial truck tire sizes null and void.

(these felloe band dimensions conforming with those adopted by the Automotive Wood Wheel Manufacturers Association):

Nominal Tire and Rim Size	Width	Depth
30x3½	1¼	1¼ (+1/16, −0)
32x3½	1¼	1¼ (+1/16, −0)
33x4	1½	1¼ (+1/16, −0)
34x4½	*2 †2¼	1¼ (+1/16, −0)

*Width of felloes for rims with special sections.
†Width of felloes for demountable rims on cold-rolled bands.

Two regular tire sizes for motorcycle wheels were recommended, viz., 26x2¼ and 28x3, and one oversize, 29x3½. Specifications are also given for the dimensions and location of the valve hole in automobile rims.

Nominal Tire Size		Oversize Tire		Tire Seat, Diameter of Rim		Type of Rim
In.	Mm.	In.	Mm.	In.	Mm.	
26x2¼	60/535	None	None	21	535	BB
28x3	75/560	29x3½	90/560	22	560	CC

It has been found that the present specification with regard to edges of felloe bands, which call for a 1/16 in. radius on the outside edges and 3/16 in. on the inside edges of the bands are not acceptable to the steel mills, and the Division therefore recommended that the radius of all edges be changed to 3/32 in.

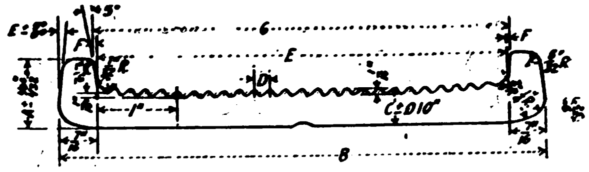
In connection with allowable tolerances for felloe bands the Division recommended that the wording be changed as follows: "Band circumferences after application to wood wheels and circumferences of steel wheels." On account of the difficulty of inspecting circumferences with a tape to the present close tolerances, the Division recommended that the tolerances for "band circumferences before application" be changed to prevailing commercial tolerances of plus 1/32 minus 1/16 in.

Base Bands for Solid Tires

A proposed standard for base bands for solid tires was also submitted. These dimensions conform to the recommended series of solid tire sizes and are in accordance with the base bands recommended and adopted by the War Service Committee of the Rubber Industry. The recommended bands relate to corrugated milled sections and it is optional with tire manufacturers to use either milled corrugated or dovetail facings, as the same general dimensions apply to bands with either facing.

The sections of tires and base bands as recommended for solid tires for trucks are also to apply to industrial truck wheels, and it is recommended that the S. A. E. adopt standard 3½ and 5 in. pressed-on channel sections for industrial truck wheels.

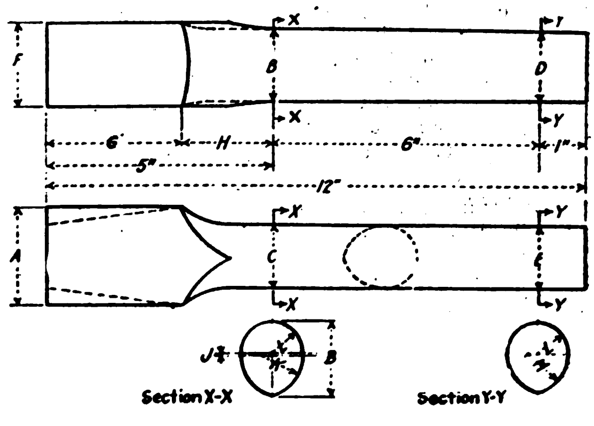
There was some rather animated discussion in connection with parts of this report. Thus, J. E. Hale objected to that



Base Band Size	A	B	Limits of B	C	Corrugations No.	D	E	G	F
3½	¾	4¼	±1/32	11/32	18	0.191	3 7/16	3 9/16	1/16
4	25/32	4 11/16	±1/32	⅜	20	0.196	3 59/64	4 1/16	3/32
5	27/32	5⅝	±1/32	7/16	26	0.189	4 59/64	5 1/16	3/32
6	27/32	6⅝	±1/32	7/16	32	0 185	5 59/64	6 1/16	3/32
7	27/32	7⅝	±1/32	7/16	36	0.192	6 59/64	7 1/16	3/32
8	⅞	8⅝	±3/64	7/16	40	0 196	7 27/32	8	5/64
10	⅞	10⅝	±3/64	7/16	50	0.196	9 27/32	10	5/64
12	⅞	12⅝	±3/64	7/16	60	0.197	11 27/32	12	5/64
14	⅞	14⅝	±3/64	7/16	70	0.197	13 27/32	14	5/64

part of the recommendation regarding base bands for solid tires which says that it is optional with tire manufacturers to use either mill corrugated or dovetail facings. Mr. Hale said that this would make a dual standard, which would be objectionable. He recommended the adoption of the corrugated facing as standard and said that it was the recommendation of the War Service Committee of the Rubber Industry that this should be the ultimate standard. Mr. Hale received no support on this recommendation, however, and another recommendation made by him, to modify the radii at the corners of the bands, also just failed of adoption when submitted to a rising vote. From another source a recommendation was made that, since there were some objections to the adoption of the base bands recommended, the whole matter should be returned to the Division for further consideration, but this was strenuously objected to by members of the Division and was voted down. A motion to refer the recommendation regarding wood spokes for passenger car wheels back to the Division was also lost, and the whole report of the Tire and Rim Division was adopted.

The last item in the report of the Tire and Rim Division related to wood spokes for passenger car wheels. The dimensions for these spokes are given in the table below.



Wood spokes—passenger car wheels

Nominal Spoke Size	A	B	C	D	E	F	G	H	L	J	K	M
1¼	See	1 13/16	1 3/16	1 13/16	1 3/16	1⅝	2¼	2¼	[illegible]	[illegible]	[illegible]	[illegible]
1⅜	Note	1¼	1¼	1 [illegible]	1¼	1⅝	2¼	2¼	[illegible]	[illegible]	[illegible]	[illegible]
1½	Below	1⅜	1⅜	1 3/16	1⅜	1⅞	3	2	[illegible]	[illegible]	[illegible]	[illegible]
1⅝		1 13/16	1 13/16	1⅝	1 13/16	2⅛	3	2	[illegible]	[illegible]	1⅛	1 1/16

Notes.—Sizes for A for each nominal size spoke are: 2, 2⅛, 2¼, 2⅜, 2½, 2⅝, 2¾, 2⅞ and 3.

Spoke numbers may be obtained by combining nominal size whole numbers; numerator of nominal size fraction; denominator of nominal size fraction; and number indicating number of eighths of an inch dimension A is over 2 inches. Thus: A 1½-inch spoke when A is equal to 2⅞ inches would be 1127.

All dimensions are for green sizes.

Principles of the Wheeled Farm Tractor*

Factors Determining the Maximum Traction Obtainable — Results of Experiments to Ascertain Rolling Resistance — Operating Efficiency and the Most Suitable Size of Machine

By Edward R. Hewitt
Consulting Engineer, International Motor Co.

THE hydrocarbon engine has in recent years placed us in possession of a light source of power for the purposes of farm traction. It is easily controlled and operated by one man. This has given the farm tractor problem quite a different position from that which it occupied when steam was the only method of propulsion. Although it was possible to make a one-man steam machine, this was not usually done, and the steam plant always had so many disadvantages in starting, use of water, leaking connections, etc., that its extended use was not to be expected.

Given a light source of power occupying comparatively small space, a tractor can take almost any form and yet do some work. While there is certainly vast latitude in design, and many different forms accomplish the purpose equally well, the fundamental principles governing the problem lay down certain postulates which must be followed if we are to reach any reasonable degree of engineering efficiency. It is to the study of these principles that I wish to draw attention, as their neglect has caused tremendous financial losses to both the manufacturers and the public. I will take up the problems, beginning, as we may say, from the ground and giving the results I have reached from my personal observation.

Friction of Wheel Upon Ground

A series of laboratory tests on full-sized wheels, which checked very well with work on the machine in the open, resulted in the following conclusions:

(1) The maximum drawbar pull is a definite function of the weight per inch of width. Weights used varied from 10 to 200 lb. per in.; the ratio of maximum possible drawbar pull to total weight on the wheel was constant for that range. This was found to be true whether the ground was wet or dry.

(2) On sandy ground the drawbar pull available with a smooth metal wheel is about 30 per cent of the weight on the wheel.

(3) On damp, sandy ground the maximum drawbar pull is greater, being about 43 per cent of the weight, and under some conditions even slightly higher.

(4) Cleats increase the maximum drawbar pull only insofar as the soil resists shearing; that is, the cleat carries a section of the top soil and slides it against the soil below the edge of the cleat. Experiments indicated that this was practically independent of the depth of the cleat, depending solely on the shearing strength of the soil at the depth of the cleat edge. In some cases the shallower cleat pulled more than the deeper cleat because the roots in the sod were not cut off and advantage was taken of their shearing strength.

Action of Cleats

In some cases subsoil may be more tenacious than the top, but this is unusual. It might be supposed that when the top is sheared from the subsoil, the soil at the back of the wheel would support it if the section were deep to a greater extent than if it were shallow. This does not appear to be the case because of the lifting action of the back of the wheel which tends to eliminate the support. This is particularly noticeable on hills when the wheel is stressed to the limit. It was found that a cleat inclined forward at an angle would improve this condition somewhat. In going uphill the cleat enters the soil almost horizontally, acting like a step and tending to lift the weight off the wheel. On leaving, the cleat stands almost vertical and causes less friction and loss of power. An inclination of about 30 deg. was found to be the most satisfactory on a 6-ft. wheel. This arrangement tends to self-clean to a great extent. Setting the cleats at an angle of 30 deg. to the axis of the wheel also helps this cleaning effect by a slipping action. The shearing strength of the soils I tested appeared to vary from 5 lb. per in. of width in dry molding sand to 75 lb. in loam or sod. No doubt, tough sod or gumbo may prove even stronger than this.

From these facts it becomes evident that weight is the only means of obtaining a tractive effort of 40 per cent of the weight of the machine under bad conditions in dry ground or sand, as cleats will be of little use. Wheels 72 in. wide would give an added pull due to the use of cleats of only 360 lb. for loose ground. Weight is therefore practically the sole reliance for traction in sand or very dry loose ground. In sod or damp ground 72-in. wheels would ordinarily give 4000 to 5000 lb. pull from the cleats alone, and the light machine with only sufficient weight to hold the cleats down would show good results.

Certain observations in operating a tractor led me to believe that the rolling losses were greater than I had anticipated, and I began a study to determine the laws governing the subject.

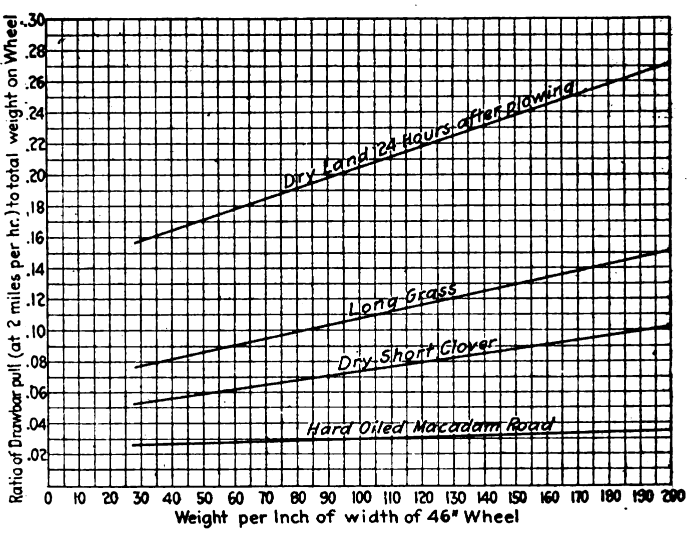


Fig. 1—Relation between weight per inch of wheel width and the ratio of drawbar pull to weight

*Read at the annual meeting of the Society of Automotive Engineers.

I took a watering cart having 46-in. wheels with 8-in. flat tires, and removed the tank, leaving only the stripped chassis. This was towed by a motor truck over several kinds of ground, and the drawbar pull was measured by spring scales. After this I replaced the body and filled it successively with various amounts of water to increase the load per inch of width on the wheels. Four types of ground surface were tested: (a) hard macadam road; (b) dry short clover; (c) sod long grass (gravelly loam); (d) dry plowed land, such as would ordinarily be harrowed, plowed 24 hours previously.

The drawbar pull was found to increase rapidly with the weight per inch of width on a regular curve on all but the hard macadam road, where the increase was only slight. This was to be expected, as the increase in pull is due to the work done in crushing the ground surface, or, in effect, continually pulling the wheel uphill. The limits selected for the tests were those under which a tractor can be built. The curve, Fig. 1, shows the ratio of the drawbar pull required for propulsion to weight plotted against wheel width in inches. The speed used was about 2 miles per hr. I could notice no marked difference in the pull from 1 to 3 miles. On some previous experiments I had observed that the rolling friction of wheels of various sizes varies inversely as their diameter, and I believe that this fact can be used with the chart as a basis for design. It would certainly be valuable to have these observations extended further to furnish a more certain basis for calculation. I have yet to see any precise data on this subject.

The value of these facts is obvious. If a tractor has too great weight per inch of width of wheel and gets on soft ground, as it must do in harrowing, etc., the power consumed in rolling friction becomes a large percentage of the total developed and the drawbar pull is proportionately decreased. There is every advantage in increasing the surface and reducing the weight. Tractors with a weight of over 200 lb. per in. of width of wheels that are even 6 ft. in diameter become very inefficient on soft ground. It is here that the "caterpillar" shows to best advantage, and if it were not for its complication and high maintenance cost, it might prove somewhat better than the wheel for many purposes. When properly proportioned, however, the wheeled machine can be made to give a very high efficiency, as I will show later on, and since wheels can be made to last the life of the machine without expense or renewal, their design is worthy of very careful study.

Weight on Wheels

Considering a four-wheel machine, with the rear wheels as drivers, it is evident that no matter what form of mechanism is used to apply the power to the wheels, the maximum drawbar pull multiplied by its lever arm ($P \times a$) cannot exceed the weight on the front wheels multiplied by a lever arm equal to the distance from the center of the front to the center of the rear wheel ($W \times b$), Fig. 2. The maximum pull which can be applied will be only that required to lift the front weight off the ground. If the machine is on a hill, this weight will be reduced as the cosine of the grade angle. In other words, when we apply power to the rear wheels we are in effect transferring part of the weight of the machine from the front to the rear wheels.

From the preceding curves it is easily seen that the increase in the weight on the rear wheels would increase the weight per inch, and so increase the rolling friction. In the first machine I designed this was very marked, as I increased the weight on the rear wheels 3500 lb. by applying full engine power, and increased the rolling friction from 20 to 25 per cent on plowed ground. The machine, therefore, did not show the drawbar pull it should from power developed by the engine. It took me several months to find the cause of the losses, and I was not absolutely certain until I had actually brake-tested the machine on the rear wheels under full power and found that the mechanical losses from the engine to the ground were only 16 per cent and did not increase materially with the lower gear ratios or increased power. Besides these serious frictional losses, very few machines in this country are proportioned in such a way that the full engine power can be applied on the low gear on any reasonable hill and not raise the front of the tractor off the ground. This interferes with the steering, and in many cases the tractor will turn over if the operator does not shut off the power. This is dangerous, and the full power of the tractor is not available. The utmost care should be exercised in having the weight on the front exactly right for the work it is desired to perform, and any failure here is inexcusable.

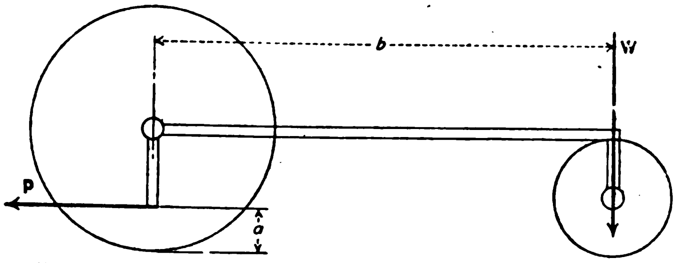

Fig. 2—Diagram of the relation between the maximum drawbar pull developed by a tractor and the weight on the wheels

If we consider a machine driving from the front wheels, the reverse is true, and the application of power decreases the weight on the drivers and reduces the possible drawbar pull which can be delivered with a given weight of tractor. This type is therefore inefficient and will eventually be abandoned. The rear drive type can be proportioned so that nearly all the weight of the front can be carried by the rear wheels when the full engine power is applied, leaving only enough weight for proper steering. This form will then develop the greatest possible pull for a given total weight.

Over-All Efficiency

By using anti-friction bearings, good lubrication and cut gears of good design, it is possible to reduce the frictional losses from the engine to the rim of the rear wheels to less than 16 per cent of the total power developed. I found on brake test of one machine that the losses with a gear reduction of 172:1 on third speed were not materially greater than the losses at 52:1 on the direct drive, where they proved to be 12.5 per cent. This is understood when we consider that we are only interposing two additional pairs of gears, the gears being well oiled and of ample size. As these gears are running in oil when the tractor is operating on the direct drive, they have under these conditions the friction of the oil in the box, which is very considerable, gearbox-oil friction with heavy oil being about 3 hp., and about 1½ hp. with light oil. To the mechanical losses must be added the rolling friction on the ground. As seen above, this may vary from 8 to 20 per cent with properly proportioned wheels.

In testing the engine on the brake I used a vacuum gage on the inlet pipe and noted the suction at various loads at the governed speed. When the engine was put on the tractor again I used this gage, which gave me the actual horsepower of the engine within a very small error, as the engine in both cases was operating at the same governed speed. A speedometer was employed that gave the feet of advance per minute of the tractor on each gear. A spring dynamometer was applied to the drawbar, giving the reading in pounds. It was a simple matter to multiply the pounds pull by the feet of advance per minute, get the delivered horsepower and compare it with the actual engine power. It was found that on good sod with short grass the efficiency of the machine was about 75 per cent, i. e., the drawbar horsepower divided by the engine horsepower was 0.75. On plowed ground, harrowing or cross-plowing, it was about 65 per cent, and never fell below that figure. When we consider the low efficiency of touring cars and trucks this seems a very satisfactory result on soft ground, and one which the engineer would scarcely expect to exceed.

The internal-combustion engine of conventional type has one serious drawback: if it is overloaded it stops at once, unless it is operating at a speed such that it is beyond its

maximum torque point, and slowing down allows the torque to increase. In this case the normal load of the engine can be slightly increased at the expense of the speed. These being operating conditions, it is evident that on a tractor the engine must be regularly operated below full load, or a specially hard pull on the plows or a slight hill will cause it to stop or necessitate a change of gears. It is therefore the usual practice to gear tractors in such a way that the engine is operated only at a small percentage of full load, say 40 or 50 per cent. This provides the safety factor for overloads and for defective oiling and cooling, as the overloads may prove to be of short duration. The curves, Fig. 3, taken as an average of tests made during several years in my own laboratory of a number of good engines, show the best fuel economy at various percentages of full load, all tests being made at the constant speed of 1000 r.p.m. The lower curve shows the best fuel economy I have yet obtained when operating conditions were at their best. The curve marked 1 may be taken to represent ordinary practice in commercial tractors. As we cannot operate continuously at full load and best economy, it is interesting to see just how far below this point we can go before the increase in fuel becomes very marked. It will be noted that we should not go below 60 per cent on an ordinary engine, while on the best ones under good conditions a fuel economy of 0.66 lb. per hp.-hr. can be obtained at 50 per cent load. Tractor engines should not be used below this point over long periods. Another point to be noted is the absolute necessity of having the engine oiled and cooled so that it can run all the time at 50 per cent to full load if we are to secure good fuel economy. A tractor, however, should work at certain specified speeds for best results on the tools used, and the pull of these tools will vary as much as 100 per cent in the same field, not to mention hills and variations of rolling resistance.

How, then, are we to get good fuel economy with two changes of gears? In my original machine I had three speeds. The high speed was reversed for road use and could not be used in the field, leaving only two speeds for actual work. I have been obliged to adopt four speeds so as to have three available speeds for field work. These are respectively 1, 2 and 3 miles per hr. at 1000 revolutions of the engine. The latter is governed to 1200 r.p.m. In this way it can be used under the proper load conditions all the time for best economy.

Suction Gage as Load Indicator

I used a suction gage on the inlet pipe as an indicator of the engine load, and have this marked so that the driver knows that it should not read over 8 in. of mercury suction, which is 50 per cent load. This point was selected as the minimum load under which the engine will operate economically. If the suction rises above this point,

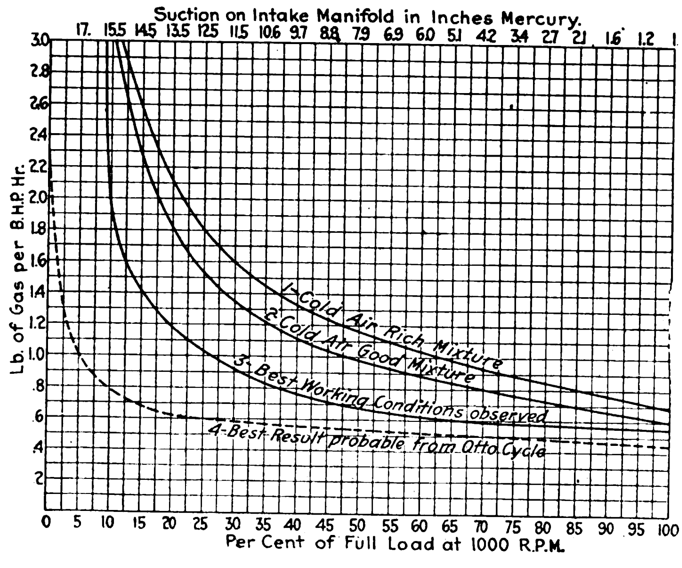

Fig. 3—Fuel economy at various percentages of load averaged from a number of tests

the driver should shift to a higher gear and load up the engine further. This is just the opposite of touring car practice, where we shift gears because the engine is overloaded and needs relief. On the tractor the heavier the load the better the fuel economy will be and the better the financial result, provided the engine is able to stand this load. We must build engines capable of holding their full power, and a cooling system that will keep them within reasonable ranges of temperature under all conditions, if we are to secure economical operation.

The size of the machine is a subject of supreme importance, and I am in the unfortunate position of being obliged to differ with the general opinion that the small tractor is the future economical unit.

The expense of operating may be divided into the three main headings of operator's wages, fuel and oil, and maintenance charges.

Considerations Affecting Size

The driver on the small machine is paid as much as on the large. The maintenance charges for actual repairs on the larger machine, if properly constructed, are not materially greater than on the small machine. The only difference here will be in the interest and depreciation items. The cost of fuel and oil will prove to be the main difference in expense. This, however, is much lower per acre on the large unit than on the small; therefore, the operating expense per acre on the large machine will be less than on the small machine, primarily because the driver's wages will prove to be at least one-third of the whole cost.

The evident answer to the question of how large the machine should be made is: as large as one man can operate easily and as large as can be run on the roads and pass through gateways and over bridges. I consider that a width of 9 ft. over all on the wheels is the outside limit in practice, and a total operating weight of 14,000 to 16,000 lb. With this weight eight plows can readily be operated, plowing at the rate of 2.8 acres per hr. This would seem to be about the practical limit for a one-man machine. The two-plow machine, on the same basis, would do 0.7 acre per hr. These figures are for the regular progress of the machine over the ground, making no allowance for delays and turns. In factory practice, with automatic machinery, it is found difficult to get more than 80 per cent of the best possible output of the machinery, and this is true when all the oiling and repairing are done outside of working hours and the operators have skilled superintendence.

How much lower ought we to expect the percentage of time in operation to be on a tractor subject to delays for oiling, filling and adjustments, not only of the machine, but of the plows and tools, stopping for corners and turns, shifting gears, etc.? An output of 60 per cent of the theoretical would be very good indeed, and I fear that it often proves to be very much lower. If we take 50 per cent of 7 acres for a day's work we get 3½ acres on an average, and this is more than is usually obtained over any long period with the two-plow machine.

Limit of One-Man Tractor

At the present time there are no eight-bottom tractor plows on the market which can be worked satisfactorily from the tractor by one man. I have made a set for my machine which works fairly well, but it will be some years before these devices can be perfected. Four-bottom plows are now to be had which with a few changes can be made to work fairly well from the tractor. It is probable that at the present time, taking into consideration all the facts of economy, first cost and ease of operation, the four-plow machine is the best suited to build. This is especially true when we consider that it is possible to design a four-plow machine with substantially no side draft and operated with the tractor wheels of ample size running on the unplowed ground.

I have just had the opportunity of getting figures from three of the best standard makes of machines working in Orange County, New York, on difficult land. They were operated for a whole season by a township committee. The

machines have averaged about an acre a day each during the season. The same money invested in horses would have done more and a larger variety of work. The cost per acre has been much greater than with horses, and the three machines all need rebuilding at considerable expense. With a capacity of 20 to 30 acres a day, we have a good chance to get 10 or 15 acres regularly. In my view, it is not the first cost of the whole outfit that will be the deciding factor, but the investment per acre worked per year. If the large and more expensive machine will do the work more cheaply, and at the same time show a lower investment per acre, it will be the one to survive in the long run. Small machines are advertised to pull mowing machines, reapers, cultivators, etc. It seems rather a step backward to be pulling these machines by a means costing at the lowest estimate from $5 to $8 a day to operate, when we can do it with horses at not over $4 to $4.50; or to be running a thresher and silo cutter with a machine costing between $900 and $1,500, when we can do the same work with a stationary engine costing between $200 and $300; while the tractor could be plowing and doing expensive work on the farm. My view is that the small tractor is rarely needed at all for the small farm. On any farm up to 100 acres the work can be done with horses more cheaply and better, especially if the farmer uses the right crop rotation and carries enough live stock. The small tractor would only be a source of expense, as he would certainly have to keep horses as well. The tractor should have at least 200 acres to cover a year, and better still, 500 or 1000. On this large output a skilled man can be employed and the machine properly worked. The tractor and farm tools that the farmer will have available for some years to come are certain to be the kind of machinery that should not be placed in the hands of the untrained.

In closing I would like to add a word as to what can be expected in the future as to the maintenance and durability of good tractors.

A motor-truck designing experience of twelve years has taught me that a well-made, properly designed gearbox and clutch will last from five to ten years with no repairs, and I see no reason why we should not expect even better results on tractors if we proportion the loads properly, especially as the tractor will not operate more than 120 days a year. The wheels on my machine show no wear after two years' work, and I am sure they will last the life of the machine, with the possible renewal of cleats every four or five years. The frame, riveting and steering-gear can be made absolutely durable. The two places in which we will have excessive wear are on the final drive to the rear wheels and on the engine. The main drive to the wheels is not durable on any machines I have seen. On my own it has lasted two years and requires renewal. It will be replaced with a drive of better proportion and materials, and better protection from dirt; I hope to get four years out of it at least. This can no doubt be further improved. On the engine the main source of wear is the dust in the cylinders. Even with a fine muslin dust filter 8 sq. ft. in area the pistons and rings were badly worn in 100 days' running. A perfect air cleaner is an absolute necessity for tractors. Those I have seen advertised thus far are all of types which will not really remove the finest particles of dust, which do the actual damage to the engine, and they cannot eliminate the trouble. If we succeed in protecting the engine from dirt, there is no reason why we cannot get ten years' service out of it with a regular overhaul every year or two. I know of motor-truck engines in operation to-day which have been in constant use for over ten years, and I firmly believe we shall make a tractor in the near future with a very low maintenance cost and a very low operating cost per acre. I believe we may hope to plow for about 60 cents per acre, on good land, this including all charges, as against $3 to $4.50 with horses. If this is accomplished, the tractor engineer will have done his bit toward solving the food problem.

Sidelights on Oil Refinery Practice*

A Discussion of Four Possible Methods of Increasing the Supply of Fuels Available for Use in Present Types of Automotive Engines

By E. W. Dean
Bureau of Mines

THE several most important ways in which the petroleum refining industry can increase the output of gasoline from a given quantity of crude oil may be listed as follows:†

(1) Universal adoption of a high "endpoint" or upper volatility limit for gasoline
(2) General use of more efficient distillation methods and equipment
(3) Recovery of gasoline now lost in refinery operations
(4) Wider use of cracking processes

There are considerable differences in the grades of gasoline marketed throughout the country by different refineries and sometimes at different times by the same refinery. A notable point of variation is the upper volatility limit, or "endpoint." In the days when gasoline was simply a by-product of the refining industry, the endpoint figure was approximately 150 deg. Cent. (302 deg. Fahr.). This type of gasoline is now practically extinct, and the so-called "high-test" engine fuel now marketed in relatively small quantities has an endpoint of approximately 175 deg. Cent. (347 deg. Fahr.). The usual grades of gasoline are represented by endpoint figures between the limits of 200 deg. Cent. (392 deg. Fahr.) and 230 deg. Cent. (446 deg. Fahr.).

The fact that gasoline of as high endpoint as 230 deg. Cent. (446 deg. Fahr.) is being used in tremendous quantity and with satisfactory results renders it desirable to consider the possible increase in engine fuel supply if this upper volatility limit were universally maintained.‡ The Bureau cannot at present go on record as either advocating or op-

*Read at the annual meeting of the Society of Automotive Engineers. Published by permission of the Director of the Bureau of Mines.

†One other possibility might be mentioned: the refining of crude petroleum now marketed as fuel oil without removing its naphtha content. The Bureau has not, however, succeeded in uncovering statistical evidence indicating that developments in this line could augment production by a maximum of more than 3 to 5 per cent of the quantity of gasoline now refined.

‡In this connection it is interesting to note the probable increase that would result if the endpoint universally adopted were sufficiently high to include the fractions of petroleum now marketed as kerosene. Bureau of Mines refinery statistics for the calendar year 1917 show that about 20 per cent of the crude petroleum refined was marketed as gasoline, and about 11 per cent as kerosene. If, therefore, the endpoint selected were high enough to include both of these fractions, instead of stopping with a figure representative of the "heavy" engine gasolines of to-day, the resulting increase in supply would be 55 per cent, instead of 15 to 20 per cent. Wherefore, it appears that even the long-sought kerosene consuming engine is not going to keep the automotive industry on "easy street" for many years.

posing such a standard, but is simply discussing what might be accomplished in the way of increased gasoline production if it were adopted. The present estimate, based on miscellaneous data at hand, is that from 15 to 20 per cent more gasoline would be available if a universal endpoint equivalent to that of the "heaviest" grade at present marketed in quantity should be maintained.

The possibility of such a standard is, incidentally, dependent upon either a considerably increased production of casinghead gasoline or the development of engines that can utilize liquid fuel having smaller properties of volatile constituents than the types now marketed. The high endpoint gasoline now marketed is almost invariably of the blended casinghead type.

The distillation methods employed by petroleum refineries do not operate with the same degree of efficiency that is attained in some other industries. Certain percentages of hydrocarbons boiling below the accepted upper temperature limit for gasoline are always present in kerosene or fuel oil. This does not necessarily discredit the technical ability of refiners, many of whom are maintaining as high a degree of distillation efficiency as is profitable under present commercial conditions. There is no doubt, however, as to the possibility of augmenting the gasoline supply through an increase in the average distillation efficiency of refineries, and it is important to estimate the order of magnitude of the probable gain.

Here again exact data are lacking, and reliance has been placed on miscellaneous indirect evidence. The probability seems to be that efficiency in gasoline recovery varies in different refineries between the limits of 75 and 95 per cent. The latter figure is probably about the maximum that can be economically attained, and the average is undoubtedly not lower than half way between the limits. It is, therefore, improbable that the nation's supply of gasoline will be increased more than about 10 per cent through advances in the technique of large scale petroleum distillation.

Recovery of Gasoline Lost at Present

Bureau of Mines refinery statistics for 1917 and for the first seven months of 1918§ show that an average of about 4 per cent of the crude oil treated was lost in the course of refinery operations. Part of this loss was, of course, inevitable, but part represented gasoline that escaped with refinery gases. Recovery of this gasoline could have been effected by the use of methods and equipment similar to those employed for the production of casinghead gasoline. Such processes are already successfully operating, and there is no reason to doubt that the extraction of gasoline from refinery gases will eventually become a general practice.

Assuming that half of refinery losses are preventable in this way, it appears that gasoline amounting to about 2 per cent of the crude oil refined and about 10 per cent of the gasoline produced could be added to the supply of motor fuel.

The wider use of cracking processes is without doubt the most promising means by which refiners can increase their output of gasoline from a given amount of crude petroleum.

In a paper presented before this Society about a year ago,|| the author ventured to state an opinion to the effect that if cracking processes were employed to the full extent of their applicability, the total production of gasoline from the quantity of crude oil now produced might be doubled. This statement is one that indicates considerable optimism for the future of the cracking art, and the Bureau has been agreeably surprised at its failure to arouse controversy. To prevent any future misinterpretation, it is perhaps best to make clear the fact that this statement implies a possibility, the commercial feasibility of which is yet to be demonstrated.

The future of cracking processes may be affected by the development of unfavorable conditions of various sorts. Two in particular deserve mention in the present connection.

Up to date, the development of the art of cracking has been far from complete, in spite of the considerable attention that has been given to this line of technical operation. Only one process, that of Burton, is to-day a real commercial factor in the production of motor fuel, and this is representative of a type that seems to involve certain inherent limitations in applicability. If the cracking reaction is to be applied to the extent necessary for a doubled gasoline production, other types of processes must be put into successful commercial operation, or the present apparent limitations of the class in which the Burton process belongs must be obviated. The Bureau of Mines is optimistic regarding the future commercial success of several other processes, but believes it is only fair to state that such success is not known to have been attained, as yet, in any large measure.

A second development that may restrict cracking operations is the existence of an unfavorable ratio between the market prices of gasoline and fuel oil. The production of cracked gasoline necessitates the consumption of fuel oil, and, if the demand for the latter commodity exceeds the supply, its price is bound to rise and the margin of profit of cracking processes wiped out. It is an open question as to whether or not the consumption of fuel oil can ever be reduced sufficiently to permit doubling the production of gasoline by the use of cracking processes. The Bureau of Mines cannot venture any prediction in this line, except that the price of gasoline is likely to exceed the present level before cracking processes will be employed to the extent indicated.

Summary

The estimates included in the present series apparently indicate that the refiner may be able to augment his production of gasoline from a given amount of crude petroleum by from 35 to 40 per cent, exclusive of the gains possible through wider application of the cracking reaction. Some of the possibilities, however, overlap each other, and a more probable summation estimate is 25 to 30 per cent. The Bureau believes that, if commercial developments are favorable, the wider use of cracking processes may permit of further increases up to a possible additional 100 per cent. No prediction, however, is ventured as to what part of this figure will actually be attained.

It may be mentioned, also, that the development of engines capable of utilizing the combined gasoline and kerosene fractions of crude petroleum would not be likely to alter the limit of maximum increase, but would materially hasten the day when it would be attained, and would, in considerable degree, help to keep the price of liquid fuel from ascending to painfully high altitudes.

The present paper may have produced the impression that the Bureau of Mines is not enthusiastic over the advantages to be gained by the development of a kerosene-consuming internal-combustion engine. Such is not the case, but it must be emphasized that this is not the only line along which the automotive industry must work.

In preparing the present paper, the author has made extensive use of statistical information collected by H. F. Mason of the Bureau of Mines. The evidence upon which estimates are based has been reviewed with H. H. Hill, J. P. Smootz and E. E. Lyder of the chemical staff of the Bureau of Mines, Petroleum Division, and the figures given have been agreed upon as most probable.

A RATHER dismal picture of the immediate outlook for the French automobile industry is painted by Charles Faroux in *La Vie Automobile*, which after more than four years' suspension has just resumed publication. Mr. Faroux says that the automobile factories have no stock under way, it is very difficult for them to obtain their raw materials, the labor situation presents problems of a most disquieting nature, and a terrible competition has to be faced not only from foreign countries but in France itself. By the latter statement Mr. Faroux makes reference to the tens of thousands of passenger cars which have been in use by the army and which are to be disposed of at public auction. He makes the suggestion that these army vehicles should be overhauled by their manufacturers and that the difference between the price realized on them at public auction and the sum demanded by the war department should be divided between the State and maker.

Possible Effect of Aircraft Experience on Automobile Practice

Three Leading Engineers Give Their Views

Howard Marmon says: *Order of importance of desirable features is entirely different in automobile and aircraft engines and main effect of aircraft experience will be improvement of shop practice.*

O. E. Hunt says: *Aircraft experience has increased respect for good metallurgical practice, giving the manufacturers a new conception of the value of high grade workmanship and of the small margin of cost over the ordinary.*

Henry M. Crane says: *There will be a continual beneficial interchange of information between the two lines of engineering, but their practices will diverge rather than approach.*

Plane and Automobile Engines Compared*

By Howard C. Marmon

IN physical construction the four-stroke cycle airplane and the automobile engine are identical. From the delivery of the fuel to the carbureter to the delivery of the power generated at the crankshaft end, the processes are the same. An automobile engine could be made to fly an airplane, and an airplane engine or a replica of it on a reduced scale to bring the power within usable limit could be made to operate an automobile. A long series of disappointments has emphasized to all of us the fact that any aggregation of parts assembled to obtain a mechanical result is a series of compromises, and the relative importance of the objectives governs the nature of the compromise.

Controlling Factors in Design

The major objectives that govern the compromises to be made in the design of airplane or automobile engines are roughly as follows in approximate relative importance. We are considering the airplane engines that have been developed for use in warfare. They must have

(1) Reliability
(2) Small weight per horsepower
(3) Economy in fuel and oil consumption
(4) Carburetion that permits easy starting and maximum power through a range of 30 per cent of the speed range, and idling at one-quarter maximum speed without danger of stalling. In short—no great degree of flexibility is required.
(5) Ability to deliver full power through a small speed range without excessive vibration.
(6) Complete local cylinder cooling under conditions of high mean effective pressure.
(7) Compactness.

In general, it can be assumed that the airplane engine will receive expert attention daily; it will be operated on a homogeneous highly volatile fuel and be lubricated with good oils. Relatively little regard need be given to the expense involved in fabricating any part of the engine or in the original tooling-up. Further, a comparatively small part of its life will be spent at sea level and none in a dust-laden atmosphere.

The automobile engine must have

(1) Reliability
(2) Silence
(3) Carburetion that accomplishes proper and even firing in all cylinders under varying throttle conditions, through speeds covering more than 90 per cent of the speed range of the engine. In short—great flexibility. Economy is secondary to this requirement.
(4) Ability to deliver partial or full torque through its entire range of speed without vibration.
(5) Compactness
(6) Small weight per horsepower.

Difference in Service Conditions

In general, it can be assumed that the automobile engine will receive attention at infrequent intervals and then usually at the hands of an inexpert person. It will be operated on

*Read at the annual meeting of the Society of Automotive Engineers.

fuels of low volatility and lacking in uniformity, and varying grades of lubricating oils will be used. The cost of fabricating the parts and tooling-up must be kept in mind. Further, the engine must be designed to operate at higher speeds than is customary in airplane engines. Its entire operation is likely to be near sea level and often in a dust-laden atmosphere.

Reliability has been given as a prime requisite for both types of engine. It should be remembered that an automobile which has traveled 10,000 miles has had its engine running from 300 to 500 hr. This is considerably in excess of the normal life of an airplane engine in warfare. A typical two-seated airplane loaded with all its paraphernalia for reconnaissance work and the incidental fighting would, as it left the ground, have 20 per cent of its weight represented by bare engine and 15 per cent by fuel for a 3 or 4 hr. flight. These figures represent the extreme that has been attained in lowering the power-weight ratio and in fuel economy. A typical automobile carrying five pasengers and fuel for an 8 or 10 hr. run would have, not including flywheel, clutch and starter, less than 10 per cent of its weight in engine and 3 per cent in fuel.

In obtaining the greatest power output per pound of weight, it is necessary to get the greatest power output per cubic inch of piston displacement. In the airplane engine the most successful solution has resulted from the use of a compact combustion chamber, valves of ample size, large passages in the intake manifolds, carbureters designed especially for the engine speeds contemplated, and the highest practical compression pressures, bearing in mind that a fuel of high volatility is to be used and much of the operation is to be at reduced barometric pressures.

High Compression Cannot Be Used

The automobile engine will not equal the airplane engine in power per cubic inch piston displacement, as it must be carbureted for greater flexibility and not solely for maximum torque output through a comparatively limited range of speed. Two to four carbureters, as is usual on multi-cylinder airplane engines and which add to their maximum output, would not be welcomed on the automobile.

Nor can the automobile engine use a compression pressure as high as that of the airplane engine, which means that its power for a given displacement, output and fuel economy must be lower. The high compression pressures would be impracticable at the full load and low engine speeds required of the automobile engine, but not of the airplane engine.

The lower grade fuels commonly used in automobile engines are more troublesome under high compressions than the fuels customarily used in airplanes. It should also be remembered that the higher the compression ratio it is possible to use at ground level in an airplane the better the engine functions at altitude. At an elevation of about 15,000 ft. the compression pressure is reduced about 40 per cent.

Compact combustion chambers make valves in the head necessary. Mechanically the most efficient way yet devised to actuate these valves is the overhead camshaft and the use of abrupt cams. The gear train for operating the overhead camshaft from the crankshaft is rather complex and expensive, but by using proper materials can be made very light and durable.

Reduced Weight in Cylinder Construction

The greatest weight reduction in cylinder construction seems to be obtained in the steel cylinders with welded-on jackets, usually individual. All-steel cylinders are available only for valve-in-the-head engines. Steel cylinders have a particular advantage in that it is possible to get cooling water close to the interior walls of the combustion chamber and to the valve seats. This is of considerable help in connection with high mean effective pressures and tends to reduce carbonization. Steel cylinder walls can be made so thin that they will permit the bore of the cylinder to increase 0.010 to 0.012 in. during the explosion stroke without affecting the power output.

If the steel cylinder is the lightest and lends itself readily to the most effective way of producing power for a given displacement, why should it not be adopted for automobile use? For passenger car use its comparative excessive cost is the least of the objections. *Per se*, the steel cylinder wall offers no advantages over cast iron. In European aviation practice, notably in air-cooled engines, steel cylinders have been lined with cast-iron sleeves about 1/32 in. thick. In its best development, for ease of manufacture, least amount of water weight, and the best circulating water distribution, the steel cylinder is of the individual type. Individual cylinders in a passenger automobile are not desirable because of the increased over-all length consequent upon such a design, the multiplicity of water, gas and exhaust connections and valves in the head. With steel cylinders valves in the head may be operated by push-rods from a camshaft in the crankcase, as in the Benz aviation engine, but for automobiles the problems of enclosure against dust and proper lubrication of parts present difficulties that are not easily solved.

Faults of Overhead Camshaft

An attempt to operate the valves of a passenger automobile with the overhead camshaft would not be likely to succeed commercially. Not only would its comparative complexity over other methods of valve operation producing excellent results be against it, but, what is more important, no durable way of driving an overhead camshaft and all the accessories required on an automobile has yet been devised. It seems to be fundamental that a passenger car engine must operate with a total amount of noise that is, at the most, unobtrusive.

In addition to this, the cylinder walls would have to be thickened to a point where no spring from the explosion pressures would result in that constant source of trouble to the manufacturer, piston slaps. Some of the weight advantages would diminish with this change.

One of the greatest contributions to our knowledge of engine manufacture resulting from airplane engine production is the steel cylinder, and, strangely enough, probably the greatest application of steel cylinders will be on the large truck or the tractor engine. Here the noise is less important, as is also the fore-and-aft bulk. The unusual cooling advantages offered by the steel cylinder fit it particularly for heavy duty under the unfavorable conditions often required of the truck or tractor. The small relative mass of such cylinders is conducive to their staying in place without the loosening or fracture due to the excessive vibrations often encountered in such cases from causes other than engine operation.

Design of Crankshafts and Crankcases

In the design of an airplane engine crankshaft, the need of minimum weight per horsepower will govern. A material of high specific strength will be used, and empirical data will be employed in the design to avoid periodic vibrations in the narrow speed zones in which the engine operates. In the layout of the automobile crankshaft, it must be remembered that all periodic vibrations must be avoided from the lowest speed to speeds higher than those employed in the airplane engine. This results in designing for a certain stiffness, which would enable the use of material relatively inferior but still having sufficient strength. Hence the requirement of smooth operation under a greater variety of conditions makes it imposible to meet, in the automobile engine, the low weight factors of the airplane engine.

What may be termed the "tubular" type of crankcase is the lightest on a power-weight basis and presents the greatest opportunity for heat dispersion from bearings of any crankcase design yet offered, and is widely used in airplane engines. It is split on its horizontal axis, the upper portion carries one-half the crankshaft bearings and the lower portion the other half, and the two halves are bolted together with bolts going entirely through the case. The conventional automobile design in which the upper half of the crankcase, plus whatever bridgework reinforcement the cylinders offer, carries the entire crankshaft load; the lower half, being merely an oil container, is quite appreciably heavier. It will, however, in all probability be retained for automobile work on account of its greater accessibility and the greater ease with which corrections for wear can be made.

Total bearing loads and the effect of parts that apply these bearing loads will be greater in automobile than in airplane engines, as higher engine speeds must be provided for. The forces due to reciprocation of parts become greater in proportion to the horsepower output than in the airplane engine. The factor V^2 of the MV^2 equation increases more rapidly than the factor M can be reduced.

Higher mechanical efficiencies with their correspondingly greater horsepower output per cubic inch will be obtained from the airplane engine than from the automobile engine. The easy clearances on the pistons, the ample freedom given all the bearings, the gear trains, etc., that mark the assembly of the airplane engine produce a machine that responds and is ready for the hardest duty at the moment it is first "fired." Give the automobile engine this same mechanical freedom, and one of the prime requirements of automobile engines—silence—will be so lacking that the engine would be promptly condemned.

The need for economy of fuel and oil has been emphasized. It appears that any fairly conventional water-cooled engine, with a reasonably compact combustion chamber with cylinders sufficiently well cooled locally to permit good compression pressures, can reach ½ lb. of fuel per b.hp.-hr. over the speed and power ranges required. Over equivalent ranges, with proper allowances made for reduced compression ratios, automobile engines will compare very favorably. However, the requirements of great flexibility, sudden demands for idling, quick acceleration in crowded traffic conditions, present economy problems for which airplane engine history provides no parallel.

While the steel-cylindered airplane engine has been considered principally, it is not intended that the well-known aluminum jacket engines, and the Bugatti extraordinarily clever design using all cast iron above the crankcase, which engines produce much the same results when installed in an airplane, be overlooked. They have one advantage for automobile use not possessed by the steel-cylinder engine—more complete inclosure of valve operating parts. However, an analysis of all of them will show that the objectives aimed at have necessitated compromises as do other constructions.

An Airplane Engine in an Automobile

Let us now see what happens if we take any four-, six-, eight-, or twelve-cylinder aviation engine and make a faithful replica of it on a reduced scale so that its power output fits the needs of the particular car we wish to try it in. The engine will be heavier per horsepower than its prototype; cylinder walls will be as thick; crankcase walls will be as thick, as undoubtedly foundry practice dictated the thickness of the larger one; ignition, spark plugs, float chamber and many similar parts will weigh as much per cylinder as in the larger engine. The weights in pounds per horsepower will show a considerable increase. However, when installed in the car, and the usual flywheel, clutch, starting and lighting systems, tire pump and so on are added, it will weigh from one-half to two-thirds as much as engines employed in usual practice.

A trial of the car so equipped will show some extraordinary performances in speed and hill climbing when the original start for the hill is rapid. City driving under traffic conditions or heavy pulling at low speeds will demand a new carbureter and intake system to meet these conditions. This will seriously affect the conditions that made the first impressive performance. When satisfactory control of the engine has been established, noises demand attention. A general snugging up of parts helps, but a few noises remain that it is finally decided can be corrected only by a redesign, probably of the valve operating gear. All this affects the original performance adversely. After this has been done, certain conditions of operation will require an enlargement and stiffening of the crankshaft to eliminate an annoying periodic vibration. The result is an engine not a great deal lighter or more efficient than the one originally designed for the car.

Airplane Engine a Higher Type

The airplane engine is a more expertly engineered and better manufactured development of the internal-combustion engine than the automobile engine. It is, however, developed for a set of objectives different than those demanded in an automobile, and none of its major features can be directly grafted upon the motor car. It is true that a multitude of engineering minutiæ have been developed that are applicable to the motor car, but the total result in operating performance is small.

The greatest contribution from the airplane engine to the motor car industry has come through the builder of the engines. He has shown that, given a definite set of specifications and a definite request for results, engines will leave his factory with absolute assurance as to what they can do. Some of the optimists have suspected this, but the war's aviation engine experience has proved it.

Motor cars will be improved as a result of our airplane experience, but this improvement will be apparent in the service the car gives, rather than in any radical changes in design. This will come about as a result of better manufacturing facilities, higher shop standards and more intelligent inspection.

Will Give Us Methods of Producing Light Weight Results at Moderate Expense

By O. E. Hunt

Chief Engineer, Carriage Division, Packard Motor Car Co.

IN the introductory part of his paper Mr. Hunt points out that although there is a corresponding part in an airplane for almost every part of the motor car there are such differences in the requirements made of the control system, body and transmission in the two types of machines that little learned in connection with airplanes will be applicable to automobiles. He then proceeds to discuss the subject of engines, which, of course, is a different matter.—EDITOR.

EXPERIENCE gained in reducing the weight and increasing the volumetric efficiency may help in a limited way to reduce the weight-horsepower ratio of car engines, but not nearly to the extent some engineers would have you believe, because, in spite of similarities in design, the engine requirements for airplane service are so far different from those for cars that factors that are vital in the former type of machine are of minor importance in the latter and vice versa. In an airplane engine dependability, light weight, high mean effective pressure, excellent economy, first cost, flexibility and quietness are controlling factors in about the order listed, while in the case of the car engine the relative order of importance is almost completely reversed and would read dependability, flexibility, quietness, first cost, economy, light weight and high mean effective pressure. Some may take exception to the order given for cars, particularly as regards first cost and light weight, but if you stop to think that probably over 90 per cent of our total car producion is designed to fit a definite price class you will realize that cost has a predominant place in the design councils of the industry as a whole, and that light weight is of major importance only as it results in the reduction of the total amount of material to be purchased, thus reducing the material bill. Flexibility and reasonable quietness, like dependability, have come to be expected in all cars, and no car that does not give a proper

performance in these respects can hope to endure in public favor. I must confess that in placing economy below first cost I am reflecting the buyer's attitude, as he, thanks to the manufacturer's reputation for never understanding his case, will give greater weight to a known economy of first cost than a promised economy of operation.

Airplane engine design detail that will increase dependability is immediately useful in cars provided it does not entail an abnormal increase in first cost. Airplane spark plug development is an example. There are other minor ones that I shall not attempt to list in detail here.

Little Regard to Cost

In general, light weight in airplane engines is obtained by the unusual use of light materials such as aluminum, regardless of cost, and by the reducing of all parts to the smallest section that will give a satisfactory dependability with little regard to the labor involved in so doing. Aluminum has been generally used for oil-pumps, water-pumps, cylinders, and to a greater extent in carbureters, induction pipes and electrical equipment than is common in car engines. A most significant sample of the minimum section method of obtaining lightness is the all-steel cylinder used on the Liberty and some other airplane engines. I believe that the more extensive use of aluminum in car engines is going to be stimulated by this experience provided the price of this alloy comes down to a point where, better machining quality allowed for, it can compare fairly well, in cost of the finished piece, with cast iron. There does not seem to be much cause to expect a landslide to light parts of the steel cylinder variety, as the cost of producing them by present methods is out of all proportion to the dividends they would pay in car service. Commercialization of the airplane engine will undoubtedly be along the lines of perfecting less expensive methods of manufacture for such parts. This may ultimately result in costs low enough to warrant their use in cars.

High Volumetric Efficiency

Many improvements contribute to high volumetric efficiency in airplane engines. Overhead valves are already used to a limited extent on car engines, but the overhead camshaft that is almost universal on airplane engines is practically unknown on cars outside the racing class, because of the difficulty of getting a quiet and inexpensive form of drive. Very high compression and open exhaust are barred for car use because the former militates against flexibility and the latter is too noisy. Abnormally large valves and high lift are generally frowned upon in cars because of the tendency to a lesser valve life and quietness in combination. The unusual care taken to cool valves and spark plugs in airplane engines to combine proper dependability and high efficiency usually involve structural features of the steel cylinder type that are too expensive for cars. Abnormally large intake passages and carbureters are not usable in automobile engines because of their unsatisfactory effect on flexibility. On the whole, one must proceed very cautiously with the use in cars of design "stunts" that contribute to raising the mean effective pressure in airplane engines or he may find to his sorrow that he has sacrificed results that the public insist upon as necessary to satisfactory car performance. There seems to be no immediate promise of a general increase in the average mean effective pressure of car engines based on airplane experience.

Fuel Economy

The dead load that present-day airplanes can handle satisfactorily is relatively small. The power required to give them satisfactory performance is so high that a considerable proportion of this dead load must go to supplies, leaving only a small portion for useful load or if a large useful load is desired the flight range is small. Economy of fuel is then of real importance. Good distribution, a carbureter setting as lean as will give full power over the engine speed range ordinarily used in flight, but not so lean as to accelerate valve burning, and a sensitive means of reducing the fuel flow to an amount that will give a proper mixture with the lighter air at altitude, are the design details used to accomplish it.

The distribution and mixture adjustment experience is usable on cars, but it is obvious that the high-speed lean setting would not give a proper flexibility. Oil economy is of much less importance from the weight standpoint, but it is carefully watched in airplane engines and the methods of producing a proper result in them will be useful in car design. Accommodating the oil supply to the load, which is very essential in airplane engines, has produced schemes for the interconnection of the throttle with the oil-pressure regulator that may find their way into cars of the higher grades.

Cost—Flexibility

It is a well-known fact that first cost has been largely forgotten in war airplane engine design where there was any military advantage to be gained by so doing. Such an atmosphere obviously has not tended to produce design detail that could be used in cars, where first cost is of great importance. Flexibility, or more particularly speed range at full load, is relatively unimportant in an airplane engine which operates in the upper 20 per cent of the possible range with a given propeller for at least 90 per cent of the time it is at work. Flexibility being sacrificed to economy through the remainder of the range, it is obvious that we can learn nothing in connection with this car essential from airplanes.

In airplane service the noise of the propeller and the open exhaust drown out the mechanical noises of even the least quiet engines. Until they are eliminated, and there seems to be no prospect of getting rid of the propeller noise, airplane engines can continue to rattle and "slop" in a way that would drive the average car user to distraction.

Summary

A summing up of all this evidence indicates that there is very little ground for a feeling that airplane experience will suddenly and immediately revolutionize cars. We may, market conditions being right, see an increase in the use of aluminum. If aircraft are commercialized to an extent that demands a volume production of engines, we may develop methods of making the minimum section type of lightness that will make this practice usable in cars. There may be an increased tendency to overhead valves and overhead camshafts if the mechanism involved can be made sufficiently inexpensive and quiet. There are possibilities of minor improvements in carburetion and oil control and in some other details.

I believe, however, that the most important contribution that the airplane has made to the automobile is the stimulus to the thought of the industry as a whole that has resulted from a contact with its design and manufacturing problems. Our war experience has set engineers to dreaming of ways to produce a light weight result at a moderate expense. It has taught an increased respect for good metallurgical practice as a necessary factor in successful design and manufacture. It has given the average manufacturer who engaged in airplane engine building a new conception of the value of high-grade workmanship and of the small margin of cost that, in many cases, separates it from the ordinary variety. I should say that in setting up new ideals of design and workmanship for the industry to strive toward it has given us an inspiration of far greater value than any design details could possibly yield.

New High Altitude Uniforms Worn by Airplane Pilots

Valve-in-Head and Aluminum Cylinder Engines Will Increase

By Henry M. Crane
Vice-President and Chief Engineer, Wright-Martin Aircraft Corporation

DURING the four and one-half years of the great war, an enormous amount of development work has been done on various types of engines suitable for use in aircraft. It is only natural, now that peace has come, to speculate as to what effect the knowledge thus gained will have on the design of motor cars.

V-type engines are those comprising two rows of cylinders. There have been a number built, also, with more than two rows of cylinders, but none of them has come into any considerable use, and in any case it is difficult to see how they would have any bearing on motor car practice. There have also been several engines having eight cylinders in a row, such as the Mercedes and Bugatti, but these do not seem to be interesting to the motor car engineers.

If we look at aviation engine design, as represented above, from a general point of view, there are several interesting features of considerable prominence that are practically standard at the present time. These features are the four-stroke cycle, the use of valves in the cylinder-heads and the use of more or less complete force-feed oiling. I do not want to be understood as saying that engines not embodying these features have no great possibilities. I have limited myself in this case to the engines that have actually proved themselves in service.

I think it is fairly obvious why the apparent standardization has taken place on the lines described. There is no question that the four-stroke cycle poppet valve engine, with valves in the head, is the lightest for its horsepower that has yet been developed into commercial use. The valve-in-the-head type, using poppet valves, has the simplicity, compactness and light weight of individual parts, which make up a light total weight. The four-stroke cycle, due to positive charging and efficient scavenging, allows very high speeds, and therefore high powers for a given size cylinder as well as excellent fuel economy. The constantly increasing speed of airplanes and the development of geared engines have made it possible to take full advantage of these characteristics.

Force-Feed Oiling Increases

The use of force-feed oiling has naturally come to the front, in view of its positive action, and because the oil circulation is of great assistance in cooling parts of the engine that would not otherwise be properly cooled.

Of course, we know that the important feature in an airplane engine is reliability of operation, together with the lightest possible weight for a given power, the weight necessarily being taken as that of the whole power plant, including all cooling accessories, fuel, oil and the necessary tanks for the length of flight required. On the other hand, long life, durability and ease of repair, while they have received a great deal of consideration, have naturally been of considerably less importance than usual, because of military considerations. Aerial warfare is more or less an informal racing proposition without any particular rules, and with the life of the pilot frequently paying for defeat. The question of first cost and the cost of maintenance, therefore, cannot be given the same consideration as in the more commercial motor car field.

It is the striving for light weight and compactness that has resulted in the various radial engines, as well as the V-type engines. It has also resulted in the development of improved forms of cylinder construction, this being a point where the greatest weight saving could be made, cast-iron cylinders due to the inherent weakness of material and methods of fabrication being extremely heavy in proportion to the work performed. The steel cylinder has become almost universal in military engines for these reasons, being formed with radiating fins in air-cooled engines and provided with suitable waterjackets in water-cooled engines.

In the water-cooled engines, two pretty definite types of construction have come to the front. The Mercedes type, in which a complete cylinder unit, including the water-jackets, valve-ports and other fittings, is made up of various parts, all of steel, in most readily machinable forms, these parts being welded together. A very large number of successful engines, including our own Liberty engine, have been constructed in this way. The second system first came into large and successful use in the Hispano-Suiza engines. In this system, the cylinder wearing surfaces are of steel, while the water-jackets, valve-ports and other parts are cast aluminum. A number of interesting modifications of the Hispano-Suiza design have recently been proposed and some of them undoubtedly will prove to be successful.

It might at this point be interesting to the members to hear that we have recently completed an engine similar to the 300-hp. Hispano-Suiza, the only difference being in the use of a steel cylinder construction, and that the weight of the two engines proved to be almost identical, the one with steel cylinders being slightly heavier dry than the one using the aluminum casting construction, but the weight with the jackets filled with water is almost identical because of the smaller amount of water carried in the steel-cylinder unit.

More Aluminum-Alloy Pistons

There has been a steadily increasing use of aluminum-alloy pistons in aviation service, partly due to the light weight, but more because of the very much improved cooling due to the high heat conductivity of this material.

Of course, crankshafts, crankcases, bearings, etc., are considerably lighter for the horsepower developed in aviation engines than in pre-war automobile designs. We must remember, however, that aircraft engines are not subjected to external shocks and vibrations to anything like the extent that automobile engines are, and, furthermore, that quietness of operation can be absolutely disregarded. If we add to these facts the point already stated, that durability, ease of manufacture and of repair have been sacrificed to a considerable extent to the saving of weight, we can reach a more just estimate as to the possible value of such improvements in future automobile designs.

A contributing factor to the lowering of the power-weight ratio has been the ability reached to maintain very high mean effective pressure in large-size cylinders. A number of very light engines are successfully developing 45 hp. per cylinder and are able to maintain this power for hours at a time. Mean effective pressures as high as 130 lb. are being maintained on cylinders having piston displacements of 140 cu. in., with compression ratios of 5.35 to 1.

There are two other things which have assisted in lightening engines, these being greatly increased power, which means that planes no longer need to be operated continuously with wide-open throttle, and that much of the flying is being done at considerable altitudes. This latter feature is being done at considerable effect on the reliability and life of all aircraft engines. Various schemes have been tried out with the view of obviating the loss of power with altitude in aircraft engines, but naturally such devices have no practical bearing on automobile work.

Another line of development which has a very direct bearing on automobile engine design was just coming to the front at the end of the war. This is the production of composite

fuels. The admixture of one part benzol with four of gasoline raises the ignition temperature of the mixture to practically that of benzol. This allows of increasing compression ratios far beyond anything that is feasible with gasoline alone. While this is of undoubted value in connection with the very high grade gasoline used for military aviation, it has a far greater interest in connection with the very much less volatile gasoline daily used in automobiles. The temperature at which gasoline ignites becomes lower and lower as less and less volatile grades are used. While we can look forward very hopefully to the effect of this new fuel development in automobile work, we must not forget that it does not solve the questions of vaporization and distribution, which are always present in using gasoline having a high boiling point.

Use of Improved Materials

Regarding the question of materials, the recent advance in aircraft engines can, I think, be attributed almost entirely to a more general knowledge of materials already in use before the war. Very much higher grade aluminum castings are required than were commercially possible several years ago. Improvement came rapidly with the increasing Government demands, but it was due to greater care and better methods rather than to any new inventions.

The same situation holds good with regard to the various steels required. In the Hispano-Suiza engine we are using steels exactly the same as we used in motor cars for the last ten years, with the exception of exhaust-valve material. The use of steel having a chromium content of 12 per cent, the so-called "stainless" steel, has, because of its non-oxidizing properties at high temperatures, been very satisfactory in exhaust valves. The Liberty engine also requires no fancy materials for its successful operation. The main thing is that information regarding the manufacture, heat-treating and testing of alloy steels is much more widely distributed than before. Personally I have learned that the fabrication of the steel to be employed is far more important than the analysis. For example, a carelessly manufactured chrome-nickel steel is a snare and a delusion. I have often felt like building one Hispano-Suiza engine using nothing but straight carbon steel throughout, provided I could get such steel fabricated with the care used in making alloy steels. I have very little doubt that such an engine would stand up in direct comparison with our regular product.

There is another point of vital importance in aircraft engines, and that is the main and connecting-rod bearings, especially the latter. I think that we have learned a great deal about making babbitt-lined bearings with bronze or steel backs since the war started, but we have been able to get excellent results with the same grades of babbitt and bronze as were used before the war, improvements being made in the method of fabrication. We have run our 300-hp. engine for hours at a time, taking from 75 to 85 hp. out of it per crankpin. Each of these bearings is about 2½ in. long, disregarding fillets, and 2⅛ in. in diameter. These engines, when run at sea level, preignite practically all the time, the best power being obtained in this manner.

Heavy Babbitt-Lined Bearing Used

We have come to the use of a rather heavy bronze back babbitt-lined bearing for this work, with sufficient oil circulation not only for lubrication but for cooling also. The smaller Hispano-Suiza engine, as well as all the engines that I have ever designed, had very energetic circulation, being far beyond immediate lubrication requirements. When the 300-hp. type was being developed the oil consumption ran very high in the early samples, and there was a suggestion from the other side to remedy this by reducing the oil flow through the crankshaft. We believed this to be a mistake, and that no such action would be necessary with proper cylinder and piston design, and this proved to be the case. With the best that we can do, in lubrication and cooling, however, unless there is a 100 per cent bond between babbitt and bronze, the bearings will not stand up, the babbitt cracking and flaking off after longer or shorter periods of operation. From our own experience we have concluded that all efforts to hold the babbitt mechanically, as by the use of holes, dovetails or screw threads, for example, accomplish no good purpose, the trouble with most of them being that they are more or less local, and also that they make rapid variations from point to point in the cross-section of the babbitt. The screw-thread system possibly has not these defects, but it has two others; first—the difficulty of getting absolute cleanliness, and second—the probability of entraining air when pouring the babbitt. After all is said and done, the one sure method consists of absolute cleanliness. If the bronze is unoxidized and the tinning is maintained in an absolutely unoxidized condition until the babbitt is poured, nothing else is required to make a thoroughly satisfactory job.

We must not overlook in this discussion the question of ignition. With detailed improvements in engine construction, higher and higher compressions have been successfully used and necessarily higher and higher explosion temperatures. In modern aviation engines, spark plugs which will run successfully in automobiles for thousands of miles without attention fail in 5 min. of full-load operation. The spark plug is a study in itself, being a beautiful compromise between running so cold that it will become fouled with oil and running so hot that it will cause preignition, or that its insulating properties will break down, causing delayed ignition or misfiring. Tremendous advances have been made in the quality of insulating material and in the detailed design of plugs, which will undoubtedly have a tendency to improve the product for automobile uses.

The effect of steady high-speed running with accompanying shocks and vibration on magnetos, especially of the eight and twelve-cylinder types, has forced a very great improvement in detail manufacture in this line. It is unbelievable that it will not have its effect on subsequent commercial manufacture. I think this is equally true of the battery ignition systems, which have come into successful use on aircraft engines during the war.

Because of the very high operating pressures and temperatures, valve or piston leakage in aircraft engines becomes a most serious matter. No new inventions in piston rings have been required to meet this condition, but simply a higher grade of fabrication on already standard lines.

In the accessory field, the design of radiators has been given a new impetus. In many motor cars the radiator, due to different features of design, is larger than is absolutely necessary and the most efficient types of cores have not been required.

Radical Changes in Design Unlikely

Looking back over the facts brought to your attention in this paper, I feel certain you will agree with me that there is no reason to expect any radical change in automobile design, due to aircraft engine development. Nearly every feature of design that I have described has been used in motor cars. For instance, an eight-cylinder V-type engined car was actually produced by E. R. Hewitt in 1908, following the idea first put into service in the Antoinette aviation engine. I do expect to see an increase in the number of valve-in-the-head engines, due in part to the general efficiency of this arrangement, but more especially to the fact that this construction lends itself extremely well to the separable cylinder head, which is coming into continually greater and greater use. We have already seen a number of successful engines with cast-aluminum block-cylinder construction and this development may be expected to continue.

I have purposely based my consideration of this subject on the commercial use of motor cars for passenger and freight service. In racing cars, of course, the effect of aviation engine progress is bound to be extremely marked, as the service required is very similar in the two cases. In commercial motor car work, however, the percentage of the total loaded weight which can be saved by detail lightening of the engine is not very great, and this saving is apt, as I have pointed out, to be at the expense of durability and ease of construction and repair.

Furthermore, in my opinion the motor car engine should be designed to develop its best pulling characteristics at considerably lower speeds than does the aircraft engine, which will undoubtedly mean very much lower compression ratios and lower mean effective pressures.

The Liberty Aircraft Engine*

A Chronological History of the Development of the Liberty Engine, with Sidelights on Incidents and Military Requirements That Affected Its Design

By J. G. Vincent
Vice-President in Charge of Engineering, Packard Motor Car Co.

UP to the time the armistice was signed, the Government maintained a strict censorship over details of its war equipment, and for this reason very little was known about the details of the Liberty aircraft engine outside of military circles. Since the signing of the armistice this censorship has been lifted, and very complete detail information covering this engine has been published. The cuts and data already published are quite accurate, and hence it seems unnecessary to give a detailed description in this paper.

It was decided to divide this paper into two parts, covering, first, the historical side of the Liberty aircraft engine; and second, a discussion of its features, explaining how these features worked out in actual practice, and what changes in the construction would appear to be desirable after extensive experience with thousands of these engines on the test stand, at the test flying fields, at the schools and on the battle front.

The historical side of this development is, in my opinion, one of the very best arguments for reasonable preparedness, and I don't think that, as an engineer, I would be doing my full duty to this Society or to our country unless I gave my brother engineers as complete a picture as may be possible of the difficulties encountered due to lack of preparedness in our Air Service when war was declared on April 6, 1917.

I urge all members of the Society to give this matter careful thought and do everything in their power to further the development of military aeronautics in this country, as we may not be so fortunate the next time in having allies to stand between us and the enemy while we spend a year laying the fundamental basis for an Air Service, as was the case in the recent emergency.

I will endeavor to set forth clearly just what happened in extensive use of the engine. It may well be that all engineers will not agree with me in some of my conclusions, but I will endeavor to be entirely unprejudiced, and my statements will be based on what I believe to be the consensus of opinion of the many experts with whom I was associated in the Engineering Division of the Bureau of Aircraft Production at the time the armistice was signed.

Aircraft Situation When We Entered War

To understand why certain moves were made it is necessary to have a clear picture of the aircraft situation as it existed in this country when we entered the war. We were totally unprepared. The Government had no adequate engineering organization, no production organization, and no samples or drawings of engines, airplanes, instruments or armament of any value for military operations on the battle front; neither did it have any definite information regarding designs being used by our allies. We had to start from absolutely nothing. Realizing the seriousness of the situation, General Squier immediately arranged a number of very important moves, and realizing that the obtaining of proper equipment was very largely a commercial matter, he gathered around him a small group of men of undoubted engineering and business ability. Among these were Howard E. Coffin, Edward A. Deeds and S. D. Waldon. These men, together with General Squier and a few others, began immediately to operate as an Aircraft Production Board.

One of the first moves of this Board was to arrange to send a commission abroad to study airplane designs, make recommendations covering machines to be copied, and put into production, and send information about such machines to America at the earliest possible moment. Major R. C. Boling headed this commission, and took with him Captain Clark, an airplane engineering expert, and Howard C. Marmon, an engine expert. Captain Clark had been head of the very small airplane engineering organization which existed as a part of the Signal Corps at the beginning of the war, and he was chosen because he was as well posted on this subject as any other man in America. Howard C. Marmon was chosen as he had had a long experience on automobile engines and was a highly-trained all-round engineer. He resigned his position with the Nordyke & Marmon Co. to take up this work, at the personal request of General Squier, and he was commissioned as a Captain in the Reserve Corps after he had been in Europe for some time. This commission left for Europe about June 15, 1917. While these preliminary moves were being made in this country, our allies, realizing our state of unpreparedness, had sent a Technical Commission to this country to act in an advisory capacity so that we might get something started along the right line with the least possible delay.

Allied Technical Commission Came Over

A combined group of French and English experts visited Detroit on May 26, 1917. I conducted them through the Aircraft Engine Experimental Department of the Packard Company, and explained the development work that had been carried on in there for two years. They seemed to be very much pleased with the quality of the work and the general details of design of the Packard aircraft engine, and stated that it would no doubt be a very fine engine for certain kinds of work, but that its power-weight ratio was too great to make it of any real value in an up-to-date military airplane. The engine would develop about 235 hp., and without water or radiator weighed a little under 3½ lb. per hp. We had a very thorough discussion of the aircraft situation, and the commission gave us many valuable hints in connection with the latest developments in Europe. I realized that there was not a single firm in the United States working on aircraft engines that would be of any real value on the fighting line.

I read later that there were at that time about thirty-seven different kinds of aircraft engines being manufactured or experimented upon in England and some forty-six different kinds in France.

This multiplicity of design not only made for high price and low production, but also caused great complication in the field, as it was next to impossible to keep on hand proper repair parts for all types of engines.

I discussed the situation with the president of the Packard Motor Car Co., who appreciated the need for a standardized line of aircraft engines, and suggested that we communicate with Mr. Coffin. I left Detroit for Washington on May 27, in company with R. D. Chapin of the Hudson company. We had a conference with Messrs. Coffin, Deeds and Waldon. I pointed out the absolute impossibility of obtaining a large production of aircraft engines in this country if the various factories were left alone to go their own way in the designing

*Read at the annual meeting of the Society of Automotive Engineers.

of aircraft engines. I told them that if it was going to be necessary for the automobile industry to build a large number of aircraft engines they must be furnished with a proper standardized design, so that they would not have to waste any time in experimental work. I pointed out the fact that the Packard engine was too low powered and too heavy, but that this could easily be remedied by increasing the piston displacement and lowering the factor of safety. I explained that this engine had been designed to weigh under 4 lb. per hp. and run for the longest possible time without overhaul, and that it was the result of specifications put up to me by the Government about two years before, but that since then aircraft development had been rapid, with the result that conditions were entirely changed. I pointed out that the French and English commission had stated to me that a fighting airplane must be equipped with an engine of the lightest possible weight per horsepower, which meant that it must be designed with the lowest possible factor of safety that would run satisfactorily for a reasonable length of time.

Designing the First Engine

After discussing the matter at some length, Mr. Deeds suggested that he would like to have me meet E. J. Hall. On May 29, Mr. Deeds, Mr. Hall and I got together, just before noon, at the New Willard Hotel, and went carefully into the situation so that we might make a joint report on the aircraft engine situation in this country promptly. By mid-afternoon Mr. Hall and I were ourselves laying down two views of a proposed eight-cylinder aircraft engine.

To get started promptly, we called Mr. Zimmerschied, who was then running the Society's Washington office, and asked him to get us a draftsman and some drafting materials. He could not locate a draftsman, but sent over his own drafting instruments. We purchased drafting tables and supplies, and soon were busy. I laid out a transverse section, and Mr. Hall a longitudinal one. We were very well posted on all engines manufactured in the United States and also a great many of the foreign makes, but we, of course, also wanted the latest information on British and French engines. We appealed to Major Souther of the Signal Corps and he immediately put Charles King on the job of rounding up this information for us.

That evening Mr. Deeds called a session at the New Willard, at which members of the French commission were present. By this time Mr. Hall and I had specific questions that we wanted to ask, and they were answered quite fully by the French officials. The next morning Mr. Zimmerschied turned one of his volunteer helpers over to us, Mr. Schoonmaker of Pittsburgh. Like Mr. Hall and myself, Mr. Schoonmaker had done no drafting work for a number of years, but nevertheless he did not hesitate to take off his coat and go to work. I turned the drawing that I was making over to Mr. Schoonmaker, and proceeded to dictate a report to the Aircraft Production Board, which Mr. Hall and I had agreed on the night before. I reproduce this report below, as I believe it clearly sets forth our understanding of the situation at that time:

First Report to Aircraft Production Board

At your request we have made a careful study of the aircraft engine situation, and hasten to submit our report:

To get this report in your hands promptly, we have condensed it as much as possible, and have covered the essentials only. In view of the fact that there are a number of good engines for training machines available, we have disregarded this type of engine, and we have confined our attention strictly to the high efficiency, low weight per horsepower type, such as is necessary at the front.

In order that any engines that are built by this country may be of any value when received at the front, it is, of course absolutely necessary that their efficiency be brought up to, or a little beyond, the best now available in Europe. The French and English Commissions have enabled us to obtain this information by answering our questions very clearly and completely. From information obtained from these gentlemen and from other sources, we believe that the Lorraine-Dietrich is the coming engine in Europe. This engine has not been built in large quantities as yet, but some thirty have been constructed and carefully tested out at sea level, and also at about 6000 ft. elevation.

The important facts about this engine are as follows: Eight cylinders, 120 mm. bore by 170 mm. stroke; cylinders made of steel with water jackets welded on. Engine is direct-driven and develops 250 hp. at 1500 r.p.m. and 270 hp. at 1700 r.p.m. The weight of the bare engine is 240 kg., or approximately 528 lb., while the weight of the engine complete, with radiator and water, is 305 kg., or 671 lb. There seems to be a reasonable doubt regarding the exact weight of the bare engine, as, while the French Commission gave us the figure of 528 lb., information from other sources indicates a weight of 552 lb. Probably some intermediate figure is more nearly correct, but in any event the engine gives a horsepower for approximately 2 lb. of weight when figured at its maximum output of 270 hp.

After obtaining this information and considering the matter very carefully, we next investigated the manner of testing such an engine, as we knew that an engine of this type could not be run at full power for long periods of time without developing serious trouble. Here again the French Commission gave us valuable information. They stated that in using an engine of this type it is only run at full power for short periods of time, while climbing or fighting, and that at all other times it is run at speeds 200 to 300 r.p.m. slower. In view of the fact that the engine is built to run under these conditions it is, of course, necessary to test it under a similar condition, and they stated when trying out a new model of engine it is their practice to mount a propeller which will just hold the engine down to maximum speed under full throttle. The engine is then run for 50 hr. in periods of 6 to 8 hr. each, but the engine is not run up to full speed for more than a total of 10 hr. during this entire period, nor is it run more than 30 min. at any single time under this condition. The other 40 hr. running is under throttled condition, turning the same propeller at 200 to 300 r.p.m. less than maximum speed.

This information is of the utmost importance, as it enables us to reduce all factors of safety and makes possible the light weight per horsepower now being obtained in Europe. After obtaining this information, we immediately laid down a proposed engine, which we believe can be produced promptly in large quantities in this country. Built carefully out of proper materials, this engine will have approximately the following characteristics and be as good, or a little better, than the Lorraine-Dietrich, which is not as yet really available abroad. In laying down this engine we have, without reserve, selected the best possible practice from both Europe and America. Practically all features of this engine have been absolutely proved out in America by experimental work and manufacturing experience in the Hall-Scott and Packard plants, and we are, therefore, willing to stake our reputations on this design unhesitatingly; providing we are allowed to see that our designs and specifications are absolutely followed.

The engine is to be of the eight-cylinder type, with cylinders set at an included angle of 45 deg. The cylinders are of the individual type, made out of steel forgings, with jackets welded on. The bore is 5 in. and the stroke 7 in., giving a piston displacement of 1100 cu. in. The crankshaft is of the five-bearing type, with all main bearings 2⅜ in. in diameter and all crankpin bearings 2¼ in. in diameter. The connecting rods are of the I-beam straddle type. This engine is of the direct-driven type with a maximum speed of 1700 r.p.m. This engine will have a maximum output of 275 hp. at 1700 r.p.m. It will weigh 525 to 550 lb., but we feel very sure of the lower figure. It will have a gasoline economy of 0.50 lb. of fuel per hp.-hr. or better; it will have an oil economy of 0.04 lb. of oil per hp.-hr. or better. Complete with water and radiator, this engine will not weigh more than 675 lb., if a properly constructed radiator is used and placed high above the engine. To obtain the above mentioned weights, it will be necessary to use the fixed type of propeller hub, which has been thoroughly proved out by Hall-Scott practice. It will also be necessary, as mentioned above, to use the very best material, workmanship and heat-treatment.

Complete detail and assembly drawings, as well as parts lists and material specifications, can be completed at the Packard factory under our direction in less than four weeks. We believe that a sample engine can also be completed in approximately six weeks, if money is used without stint. As soon as the drawings, specifications and a sample engine have been finished, complete information would, of course, be available, so that any high-grade manufacturer could either make parts for this engine or manufacture it complete.

In laying down this design, we have had in mind the extreme importance of interchangeability, as a well laid comprehensive program, which has for its base interchangeability of important parts, such as cylinders, will speed up output and reduce ultimate cost to an astonishing extent. Europe is suffering right now from lack of uniformity of design, but it is too late for them to change their plan. We

however, can take a leaf out of their book and start right.

In the design which we have laid down, the cylinder, for instance, can be used to make four, six, eight and twelve-cylinder engines. As this is the most intricate part to make, immense facilities could be provided to produce them in large quantities for the use of many concerns who could manufacture the rest of the engine. Nearly all small parts, and numerous large and important ones, would also be interchangeable. This would not only speed up production, but would be of the utmost importance in connection with repairs and replacements. A full line of engines made according to this plan would line up about as folows:

Type	Rated hp.	Maximum hp.	Weight, lb.	Weight per hp., lb.
4	110	135	3[illegible]5	2.7
6	165	205	400	2.8
8	225	275	535	1.9
12	335	410	710	1.7

Respectfully submitted,
(Signed) J. G. VINCENT.
(Signed) E. J. HALL.

The above report was finished on the afternoon of May 31, and we had at that time gotten the cross-section and longitudinal section drawings fairly well blocked out. About 3 p. m., Mr. Waldon telephoned Mr. Hall and me to bring our report and drawings over to General Squier's office, in the Army and Navy Building. When we arrived we were promptly shown in the conference room, where a joint conference of the Army and Navy and Aircraft Production Boards was in session, with Mr. Coffin in the chair. Mr. Coffin called for our report, and we asked Mr. Waldon to read it.

Actual Layout Work Started

After the report was read we were asked to explain the drawings, which we did as quickly and clearly as possible. We, of course, explained that these drawings were only intended to show the general idea, and that we would, however, get layouts made quickly if our suggestions met with favor. We were immediately requested to go ahead with all possible haste and make good layouts. We wired to Detroit for two good layout men, and they arrived about noon Friday, June 1. Messrs. Hall, Schoonmaker and I kept right ahead with our layouts, on which we were determining construction features. This allowed good layout men to go right ahead with finished layouts of settled construction. We all worked right straight through until Monday afternoon, June 4. By that time the layout men had finished good, accurate layouts of the longitudinal section, transverse section, rear elevation and camshaft assembly views of the eight-cylinder engine.

About the middle of the afternoon of June 4, Mr. Hall and I were again requested to go before the joint committee of the Army and Navy, with the Aircraft Production Board, to make a further report. We exhibited the finished drawings and went somewhat more into detail than had been possible at the previous meeting. After we had explained the drawings we left the conference with Mr. Deeds, who was just leaving for Dayton. Mr. Deeds told us that it had been decided that we should build ten sample engines, five of the eight-cylinder size and five of the twelve-cylinder, and asked us to "go to it" and produce the first sample eight-cylinder engine at the earliest possible moment. He told us he had promised that we would finish the first sample eight-cylinder engine in seven weeks from that date. We immediately sent the layout men home to Detroit with instructions to complete the detail drawings of the long-time parts, such as cylinders and crankcase, immediately.

Mr. Hall went to Indianapolis that night and I went to New York, where I met Mr. Macauley the next morning and explained to him just what had taken place. Mr. Macauley and I returned to Washington on the morning of June 6, and immediately went into conference with Messrs. Deeds, Waldon and Hall. Mr. Deeds explained to Mr. Macauley the great advantage of standardizing a line of U. S. A. engines, and after a little thought Mr. Macauley not only agreed to this very radical step, but also to the loan of my services to the Government for a period of three months so that I might follow up the engineering work which had been started.

Mr. Deeds explained to Mr. Macauley that money had been appropriated to cover the cost of this development, but that he realized that to make good on the deliveries which he had promised I must have the ability to order things quickly through commercial channels, with which I was well acquainted. To this end he requested Mr. Macauley to arrange for the Packard Motor Car Co. to "finance the job," so to speak, or, in other words, to buy and pay for anything which I requested for the work, with the understanding that the Packard company would render an accounting, and be reimbursed by the Government. Mr. Macauley agreed to do as requested, stating that this work would be put ahead of anything in the factory, and that I would have the "right of way," not only as to the services of my well-trained experimental organization, but the factory facilities also. This was the day on which the "U. S. standardized aircraft engine" idea was really settled.

Originally It Was the U. S. A. Engine

As a matter of interest, I will state that Mr. Hall and I designated this line of engines as the U. S. A. standardized line, but a little later I believe Admiral Taylor "dubbed" it the "Liberty" engine in one of the Aircraft Board meetings, and this name took so well that we were forced to adopt it, and change all our titles on the drawings.

Mr. Hall and I left Washington Thursday noon, June 7, for Detroit, where we arrived on Friday morning. We went to the Packard factory and looked over the work on detail drawings which had been started. We found that O. E. Hunt had taken very prompt action, and already secured billets of steel from Cleveland out of which to make cylinders for the first engines. Mr. Hall spent the day going over various matters with me, and left on the night boat for Cleveland to make arrangements to get crankshaft forgings for the first engine. These forgings, completely heat-treated, were produced in three days, Mr. Hall having given permission to "dig out" his dies.

I, of course, realized that to get the first engine quickly we must have detail drawings almost immediately, and I therefore called for volunteers from the various drafting departments of the Packard organization to work Saturday afternoon and Sunday. Every man volunteered, with the result that we had a very large force working Saturday afternoon and Sunday, and during this day and a half approximately 86 per cent of the detail drawings were finished on vellum, from which blueprints could be made. In other words, on the morning of June 11 I was enabled to get blueprints of 86 per cent of the parts, and I immediately began calling on various automobile and accessory manufacturers to rush through enough parts for a first sample eight-cylinder engine.

The crankcase upper and lower halves were, of course, long-time parts, and these drawings could not be finished in a day and a half. We did, however, succeed in getting them nearly enough completed by Wednesday, June 13, to enable us to take off preliminary prints. These preliminary prints enabled us to start pattern work and also a wood model of the engine. Vellum drawings of the upper and lower halves were finished on Friday, June 15, and good blueprints were put in the hands of the experimental pattern shop.

In the meantime, the pattern shop had been working night and day on the wood model, which they succeeded in finishing and shipping to Dr. Stratton at the Bureau of Standards, on Saturday. By this time the vellum drawings on all the major parts, except those contained in the oil-pump assembly, had been completed, and enough parts for a sample engine ordered from various factories.

Assembling an Engineering Organization

While all this work was going on during the week ended June 16 the Aircraft Production Board was furnishing engineering offices at the Bureau of Standards, Washington, where space had been arranged for by Dr. Stratton. I left Detroit on Sunday, June 17, with a complete engineering organization, which had been drawn from various automobile factories, including the Cadillac, Dodge and Packard. Engineers were also sent from the Pierce-Arrow plant, and

they met us at Washington. I arrived in Washington on Monday morning and immediately set to work getting settled in our new quarters at the Bureau of Standards.

In order to "put over" a job of this magnitude in a short time a tremendous amount of work must be accomplished quickly through the co-operation of a great many people who are peculiarly fitted by their training to do their particular part without detailed supervision. At this stage the design was practically settled and the work of building samples was well under way. Everybody connected with the job continued to put forth his very best efforts, with the result that our first sample Liberty engine was delivered to the Bureau of Standards, Washington, on July 3, 1917. Additional samples of the eight-cylinder, also samples of the twelve-cylinder, followed quickly, and the first sample twelve-cylinder Liberty finished its first official 50-hr. run at 1.30 a. m., Aug. 25, 1917, having gone through this 50-hr. run in an elapsed time of only about 55 hr., thus breaking all records for tests of this kind. It is usual to run such tests in periods of 5 hr. each, two runs being made each day. In other words, it usually takes five or more days to complete such a test. This 50-hr. test was made under the supervision of Government Inspector Lynn Reynolds, and after finishing his very complete report of the test, he wrote the following foreword:

The appended report is a survey of the main phases of the 50-hr. endurance test, maximum power curve calibration on electric dynamometer, and inspection of dismantled parts of U. S. A. twelve-cylinder aircraft engine No. 1, which were made under the supervision of the Equipment Division, Signal Corps, at the Packard factory, Detroit, Mich., Aug. 22 to 25, 1917.

A consideration of the data collected, we believe, will show that the fundamental construction is such that very satisfactory service with a long life and a high order of efficiency will be given by this power plant, and that the design has passed from the experimental stage into the field of proven engines.

The First Engine Completed

All the Government officials who had been following this job carefully realized that while no doubt a great deal of detail work remained to be done, this test conclusively proved that we had an engine design capable of being produced in large quantities in this country, and that it would compare favorably with the best designs that had been developed in Europe. Acting on this belief, all possible haste was made in cleaning up the drawings, and a complete set of drawings of both the eight and twelve-cylinder designs were turned over to Lieutenant Emmons, who was in charge of Engine Production, about Oct. 1, 1917. It was, of course, understood that many detail changes would have to be made in these drawings during the early stage of manufacture.

After careful consideration of reports from abroad it was decided to put the twelve-cylinder engine into production and hold the eight-cylinder back, as all demands from abroad called for around 400 hp. The first "production" twelve-cylinder engine was delivered at McCook Field, Dayton, Ohio, on Thanksgiving Day, 1917, but it should be borne in mind that this engine was only partially made from production tools. In fact, the first several hundred engines were made more or less by hand to get out a reasonable quantity at the earliest possible date, and thus permit extensive tryouts under actual flying conditions.

During the time that this work was going on, Captains Clark and Marmon returned from Europe, and after going over the Liberty engine carefully in light of what they had learned, agreed that we had been very wise in developing the Liberty engine, because, in their opinion, an engine of 400 hp. was essential for types of machines that it had been decided we should manufacture, and they stated that no proved 400-hp. engine existed in Europe.

Spurred on by this encouraging information, every one concerned put forth his best efforts to get into quantity quality production at the earliest possible date. From this point on the facts are pretty generally known. As soon as the necessary samples could be shipped to Europe they were carefully tried out under actual flying conditions by our allies. First England, and then France and Italy accepted the engine and began to negotiate for the purchase of these twelve-cylinder Liberty engines for installation in their planes. Unfortunately, our own plane production was considerably delayed, not so much on account of the plane itself, but because of the fact that we did not have in this country the necessary instruments and armament to equip the planes. In other words, the design of the De Haviland Four could have been finally settled in November or December, 1917, had information been available as regards all the instruments and armaments, but this information did not become available until late in March, 1918. As soon as this information was available the De Haviland Four design was quickly cleaned up, and I believe that a real record was made in getting it into production after that time.

What the Tests Revealed

As soon as these planes became available they were extensively tested both in this country and abroad, with the result that numerous minor faults were developed, which had to be corrected. The extensive test work of the Liberty-De Haviland combination also developed several shortcomings in the Liberty engine, which had to be corrected after production was fairly well under way in one plant. In this connection, however, it is interesting to note that the correction of none of these difficulties involved any radical change in the basic design.

It is now a well-known fact that the De Haviland plane equipped with the Liberty Twelve did wonderful work at the front, and that it was considered the best all-round plane available at the time the armistice was signed. It is also a significant fact that England, France and Italy were taking deliveries of these engines just as fast as they could get them, and installing them in their various types of observation, two-seated fighting, day bombing and night bombing machines.

The fact that no tried 400-hp. engine existed in Europe was one good reason for developing the Liberty engine, but other equally good reasons existed. The engines developed by our allies had been built under extreme pressure. There were so many different kinds that none of them were made in any great quantities. Probably the two best foreign engines at that time were the Rolls-Royce and the Hispano-Suiza. According to information received at that time, the Rolls-Royce developed about 350 to 375 hp. and was recognized as probably the best large engine available for our allies. It was, however, developed for European manufacture in small quantities, and was composed of a great many intricate parts, which would be very hard to manufacture in quantity under American production conditions. For example, many of the important forgings would have to be made much better than it had been our practice in this country. The Liberty engine was designed to be as reliable as Rolls-Royce, develop a little more power, be a little lighter per horsepower and cost about one-half as much. These aims have all been accomplished.

The Hispano-Suiza was a smaller engine, and as it was already in production in this country, and continued to be produced in increasing quantities, it need not be considered in this discussion.

Lorraine-Dietrich Held Up As Model

The Lorraine-Dietrich eight-cylinder engine, which it will be remembered was held up to Mr. Hall and me as the coming aircraft engine in Europe, did not come through the experimental stage as fast as had been anticipated. While Captains Clark and Marmon were in Europe they examined both eight and twelve-cylinder models of this engine, but upon their return stated that it had not yet gone into quantity production, and as nearly as they could determine these engines were still in the experimental stage. Our Government had for months a standing order to ship one of the twelve-cylinder Lorraine-Dietrich engines to us, but it was never received. It is obvious, therefore, that it would have been a great mistake to have depended on putting either of these Lorraine-Dietrich engines into production in the United States.

The only other Allied engine that looked at all interesting was the Bugatti, and arrangements were made to bring a sample of this engine to America, so that it might be put into

production. As was to be expected, it had to be entirely redesigned for American methods of manufacture, with the result that it was just getting into production when the armistice was signed. This engine was designed for a special type of service and can never be as light per horsepower as the Liberty. It may, however, have distinct military value for certain kinds of work.

A Standardized Line of Engines

To sum up what has been accomplished by the designing of the standardized Liberty aircraft engine, I will state that this development made it possible for the United States to produce large quantities of 400 to 420-hp. reliable light-weight aircraft engines. Handling of the maintenances problem was greatly facilitated, with but one set of repair parts for the vast number of engines manufactured.

I am not in possession of exact information regarding production, but I know that the first production engine was delivered to the Government in less than six months from the date that Mr. Hall and I turned in our original recommendation, and within a year from the date our recommendation was made some five or six large companies were in quantity production, and the output was increasing steadily day by day.

Had the war gone on for a few more months, we would have also been producing the 280 to 300-hp. Liberty Eight in large quantities for single-seated fighting or chasse machines. To take care of the maintenance work on these eight-cylinder engines, it would have been necessary to put into stock only some twelve additional parts, as the eight-cylinder parts are interchangeable with the twelve-cylinder, except as to a few special parts such as the crankcase, crankshaft and the like.

An important advantage of the standardized line of engines, which is ordinarily overlooked, is the matter of installation in planes. To be a good job, all airplanes must be designed around the engine and equipment. Every different type of engine presents many new installation difficulties. We have worked out a standard form of installation for the standardized line of Liberty engines, so that we could give a plane designer definite information as to the engine tachometer, the gasoline system, the oil system, cooling system, the spark throttle and altitude control system, and many other details too numerous to mention.

Standardization and Reliability

I have talked with many experts who have been sent over by our Allies, and all who have had practical experience at the front state emphatically that the most important thing about a military airplane is to have it reliable, and they, therefore, agree with me that it is very important to have all the systems standardized as outlined above so that the troubles may be worked out of them. They have stated to me that it has never been possible to work out good standardized systems abroad, on account of the fact that they have had so many different kinds of engines to install. Due to this fact, most of their installations have been more or less of a makeshift, and a very large percentage of their failures have been due to failures of some part of these systems, rather than to the engine or plane proper.

I hope that I have made the matter of standardization clear, as I consider it of the utmost importance, but I do not want to be understood as advocating that the Government use only one or two kinds of engines during peace time. The standardized Liberty aircraft engine was designed to meet an actual emergency, and I believe that everybody who is familiar with the facts will agree that it was a very wise move. On the other hand, it would greatly retard development if the Government did not give careful and unprejudiced consideration to all designs submitted during peace times. If there is to be any real progress in the development of aircraft engines, airplanes or airplane equipment, however, it must be brought about by the co-operation of engineers and proper officials of our Government.

At the present time the Engineering Division of the Bureau of Aircraft Production and the Technical Section of the Department of Military Aeronautics are being merged into one peace-time organization, which will probably be known as the Technical Section of the Department of Military Aeronautics. This reorganization is being carried out under the direction of Col. T. H. Bane, of the Air Service, whom I personally know to be well fitted for the job, on account of his long training in the army, his knowledge of military aeronautics and his thorough broad-mindedness and impartiality.

The Technical Section of the Department of Military Aeronautics is a mammoth bureau of information, having on file at the present time a complete record of the present state of the art, not only in this country, but in all important foreign countries as well. In addition to serving as a bureau of information, this section, through its officers, acts in an advisory capacity to engineers, as critic of designs or sample machines, and last, but not least, as an experimental organization to test out all designs which are submitted. By co-operating with this department, all engineers may secure exactly the same data and advice, and be sure that their equipment will be tested in an unbiased, as well as in a standardized, way. In other words, all engineers will have exactly the same chance, and may be posted beforehand as to just what tests their equipment will have to pass through.

Much Depends on Proper Support

If the Department of Military Aeronautics is given proper support, as it must be if we are to remain prepared in our air service, the Government will be in a position to go into production quickly in any emergency, because the Technical Section will have a complete record of all tests, and will, therefore, be in a position to select the best equipment of each kind; and, furthermore, it will be in possession of the necessary drawings, specifications, etc., so that in such emergency there would be no necessity for an experimental stage.

In closing this chapter of my paper I want to urge all engineers who are interested in aeronautics to co-operate with the Technical Section of the Department of Military Aeronautics and work for the maintenance of a permanent technical department, in connection with our Air Service, so that we may never again be caught in the pitiful condition that existed in the early part of 1917.

[*The concluding part of Mr. Vincent's paper, in which are given reasons for features of the design, will be printed in next week's issue.*—EDITOR.]

Vineyard Tractors Needed in France

AMERICAN CONSUL PAUL H. CRAM, of Cette, states in a recent report that owing to the shortage of labor and horses, there exists in that district, as in all parts of France, an excellent market for farm tractors. However, it should be noted that wine-growing is by far the chief branch of agriculture carried on in that region.

In a communication to the "Académie d'Agriculture" dated Dec. 12, 1917, Mr. Ringelmann, director of the "Station d'Essais de Machines de Paris," explained the importance of the market which French, Algerian and Tunisian vineyards offered to farm tractors. The extent of the vineyards which may be cultivated mechanically is estimated at 640,000 hectares (1,581,468 acres). Mr. Ringelmann stated that at that time (in 1917) no tractors had been constructed specially adapted for use in the vineyards.

The labor to be performed in the vineyards consists of plowing to a depth of 4 to 6 in. and scarifying to a depth of 2 in. According to Mr. Ringelmann, the maximum width of a tractor should not exceed 1 meter (39.36 in.). The tractor, together with the plow or cultivator, should be able to turn around within a distance of 3 meters (9.84 ft.) at a maximum. The weight should not exceed 2400 lb. Furthermore, the tractors should be so constructed that they may be utilized for the application of sulphate and sulphur to the vineyards. In order to make use of these tractors for hoeing and weeding purposes, it would be necessary to install an appliance which would permit a modification of the distance between the wheels in order to correspond with the space between the lines of vines. The outer side of the tires of the wheels should pass at about 8 in. from the axis of the line of vines to be weeded.

The New York Show

FROM an automobile-commercial standpoint, the war came to an end at an opportune time. Had it lasted only two months longer the manufacture of automobiles for the general market would have been entirely stopped and the succession of annual shows in this city, which has been continuous since 1900, would have been broken.

It had already been decided by the National Automobile Chamber of Commerce to abandon the show this winter, but the signing of the armistice on November 11 made it possible to hold it, although the date had to be set one month later than usual. While there is thus no break in the continuity of the annual exhibitions, there has been a change in management, the show this year being conducted by the New York automobile dealers' organization instead of the National Automobile Chamber of Commerce. This change, however, will hardly be apparent to the attending public. In former years the manufacturers staged the show and the dealers from a considerable eastern territory were on hand to take care of customers from their localities. This year the New York dealer will be the exhibitor, but no doubt factory representatives will be in attendance to look after those seeking agencies. Many agency connections have been broken during the past year, partly because of the demands of the war upon the manpower of the country and partly because the manufacturers, being kept busy with war work, were unable to deliver cars. Consequently, it is to be presumed that now, when the manufacturers are again in position to devote all their efforts to the production of cars, there will be a greater demand for "territory" than there has been for years back.

It would be futile to look for striking technical innovations at the show. Up to the time the armistice was signed automobile manufacturers were looking forward to a complete stoppage of car manufacture for an indefinite period, and the minds of their engineers naturally were concentrated on problems connected with the work that was to occupy them during this period. There has not been time enough since to create anything new and put it in shape for production, hence what we are seeing at the show are the same models that were exhibited last winter. The few exceptions do not invalidate this statement.

Special Show Chassis Scarce

It is probably due to the haste with which the exhibits had to be prepared that finely finished chassis and special bodies are less conspicuous than at previous shows. The preparation of such show models demands a great deal of time and also involves a good deal of expense. A local dealer, of course, cannot go to the same expense in preparing show samples as can a manufacturer. The fact that the New York show this year follows the Chicago show, and that without interval so as to preclude the transfer of exhibits from one show to the other, may have had its effect. On the whole, the New York show this year is a plain business show at which practically none but stock models are shown. The war, moreover, has left its imprint on the show, in that not a few of the makers, in accordance with the recommendations of the Commercial Economy Board, have reduced the number of different models manufactured by them. Thus the cloverleaf and so-called sport models, which never sold in the same numbers as the standard runabout and touring car models, are less conspicuous than at former shows.

As to the success of the show, it is still too early to speak with assurance. On the opening night the attendance was good, though there was not the same jam as in previous years. However, it has always been the custom to swell the opening attendance by artificial means, and it would be unwise to take this as a criterion of public interest. As usual when the show is held in Madison Square Garden, it has a fine setting, and weather conditions at the opening also were very propitious.

Powering of Cars

AN engineer in a recent letter regretted that there are no settled standards for powering passenger cars. Most other features of design have been brought down to a well-defined basis, but nobody seems to be able to say what should be the horsepower of a car of given weight and load carrying capacity. This is the more remarkable since extension acceleration tests have been carried out in recent years. Our correspondent remarks that if there were some generally accepted standard for the amount of power that must be provided in cars of definite weight, we would not have the present great differences in the ability and liveliness of cars, for which there seems to be absolutely no warrant.

We do not believe that a uniform rule for powering passenger cars will ever be adopted. A great many drivers strongly favor "high ability"—a car capable of rapid acceleration, that responds almost instantly to the throttle. However, this quality in automobiles is rather expensive to the owner. It means the provision of an engine of great piston displacement with its attendant low fuel efficiency. Not only does an over-powered car burn more fuel per mile of travel, but its tire consumption also will be materially greater, owing to the heavy strain on the tires due to rapid acceleration.

There are many purchasers who are not aware of these uneconomical features of the super-powered car and there are others who do not mind them because they appreciate the operating qualities of such a machine. On the other hand, the war has taught most people to economize, and the maker at least knows that in order to minimize the fuel consumption the piston displacement must be kept down. Striking an average will not meet the case. There are a sufficient number of people who want a lively car regardless of cost to afford a good market for a machine of this type and there are many more who are looking for an economical car.

The designer, therefore, should first select the class of customers which he wants to supply and then power his car accordingly.

Aviation Influence

IT it remarkable that three of the most prominent engineers in our aircraft program should agree so closely in their comments on the influence of airplane engines on the design of power plants for automobiles as they did in their papers presented before the winter meeting of the Society of Automotive Engineers.

These papers, which were probably prepared independently, showed a unanimity of thought which is very rare when future practice is discussed. The matter was commented on by President Kettering from the platform and also by a great many in the audience.

Yet, are there not a good many thoughts on this subject which were not brought out? There is no doubt that engines for passenger car and truck work are going to remain much as they are, and there is no chance of airplane engine practice revolutionizing the modern gasoline engine. Nevertheless, this subject presents so many angles that it is not right to dismiss it with generalities.

Surely the experiences with the airplane type of valve have taught some valuable lessons! We must have learned something from the use of heavy section aluminum pistons, steel cylinders, pressure oiling and the general application of light-weight design which will have its influence in improvng the performance of the high duty, high-speed type of engine. Further and more detailed discussion of this subject should bring to light many matters relating principally to detail refinement but which have a marked influence on general performance.

Makers' Attitude Towards Standardization

LIKE every other movement of importance in the world's progress, engineering standardization has met with a good deal of opposition. While, on the one hand, it is being hailed as a great boon to the industry and encouraged in every way, on the other hand faults are being found continually and the work is impeded as much as possible.

It is now quite clear that standardization is a great help to the organization of large industries. Where the products of one branch of the industry have to be used by another branch and fitted to its products, standardization eliminates many difficulties. If the parts are made to certain outside dimensions with definite tolerances, not only can the purchaser be sure that they will fit when received, but in case one source of supply fails the parts can be obtained from another and used without any change in the design of the machine.

But when standardization is attempted of what may be designated the "internals" of a part, the resentment of the manufacturer is likely to be aroused. When the parts have to fit only other parts that are made in his own plant his engineering department can handle the matter alone without outside help. The situation would be a very simple one if all factories specialized to the same degree, for probably no one would force himself upon the manufacturer insisting on giving him help on what are recognized to be his own problems. But this is far from being the case. Where one manufacturer produces almost every part of a complete car, another turns out only bearing bushings or similar parts. Consequently, their respective interests are entirely different and this often explains their different attitude toward standardization.

During the early years of automobile standardization many manufacturers looked upon the movement with a great deal of suspicion, and especially were they afraid that some competitor might "put something over" on them by getting standards adopted that were right in line with his methods and designs. Very little or nothing of this sort has ever occurred, however.

Latest News of the

Manly Will Head S. A. E., 1919-1920

Society Has Had Successful Season—Increasing Membership at Rate of 1,000 Per Year—Finances in Excellent Condition

NEW YORK, Feb. 5—The annual professional section of the Society of Automotive Engineers opened to-day with an attendance which crowded the seating capacity of the auditorium of the Engineering Societies Building. Tractors, war and commercial, and an automobile engine symposium filled the day's program with the exception of a short time devoted to the business of the society, during which the new officers were announced and the financial and membership matters were shown to be in flourishing condition. The assets of the society are now $79,000.

Charles M. Manly of the Curtiss Aeroplane & Motor Corp. will head the S. A. E. for the 1919-1920 term. B. B. Bachman, chief engineer of the Autocar Co., will be first vice-president. The other officers are: Second vice-presidents, E. H. Belden, E. A. Sperry, T. B. Funk, John J. Armory and L. S. Kielholtz, representing, respectively, the motor car, aviation, tractor, marine and stationary engine fields. The following have been elected as councillors for 2 years: E. A. DeWaters, David Fergusson, E. A. Johnston, and for 1 year Charles S. Crawford and J. B. Whitbeck. The treasurer is C. B. Whittelsey.

Membership in the society is now increasing at the rate of 1000 per year. On Jan. 1 the society had a membership of 3866. The financial returns and earnings were greater last year than ever before in spite of the war, and the outlook is excellent for a greatly increased membership and a successful year in every way.

Short but significant discussions are developing as a result of the program laid down for the professional sessions. A symposium on the probable effect of airplane engine design on automobile practice was awaited with interest by the society, this being rendered by H. M. Crane, Howard Marmon and O. E. Hunt. These men, all having had extended experience in the manufacture of airplanes during the war, were in remarkable alignment as regards their opinions.

It is their unanimous opinion that the real influence will be in the introduction of better manufacturing methods in automobile practice due to the education of handling finer materials and through closer limits on a production basis. All are agreed that greater noise and decreased flexibility of the airplane engine make it impossible as a motor car powerplant.

Considerable surprise was expressed by some of the members in regard to the poor economy secured in the British tractor tests where some of the tractors used as much as 8 gal. per acre pulling a four-bottom plow. This was brought out by Edward R. Hewitt in digesting his paper on the "Principles of the Wheeled Farm Tractor." According to Mr. Hewitt's figures the best results secured were 2½ gal. per acre and the average was 5½ gal. Another comment made was on the poor acreage plowed in the English tests. It was cited by one member that in Texas he had been able to average 7 acres per day, plowing 280 acres in 40 days with a three-bottom machine.

President C. F. Kettering pointed out that even with the tractor of admittedly poor construction the farmer cannot afford to dispense with it, as he is able to have his silo full of feed that would otherwise not be there. The season is short in which definite work is to be done on the farm and the ability of the tractor to handle it is one of the best reasons for its success.

C. M. MANLY

Newly elected President of the S. A. E.

Mr. Manly is one of the pioneers of the airplane industry, having been associated with Professor Langley in the latter's historic experiments on mechanical flight during the early part of the present century. He is also the inventor of a hydraulic transmission for motor vehicles and occupies the position of consulting and chief inspection engineer of the Curtiss Aeroplane Corporation.

Lieut.-Col. H. W. Alden in presenting his paper on "Tanks" gave some interesting sidelights on the real purposes of these fighting machines, telling that the work for which they are most valuable is the elimination of machine gun nests. Moving pictures showing the 40-ton Mark VIII machine in action were given.

Morse Abroad for Willys-Overland

NEW YORK, Feb. 5—Elliot C. Morse, chief of the Willys-Overland Export Co., sailed to-day for England to look into export and import conditions in that country and throughout Europe. He will be away until May 1. Mr. Morse was in charge of Willys-Overland Co. interests in Washington during the war, and has now taken over the supervision of the foreign business of the company.

$29,940,780 General Motors Surplus

NEW YORK, Feb. 5—The financial statement of the General Motors Corp. and its subsidiary companies, including five months' operation of Chevrolet for the twelve months ending Sept. 30, 1918, shows total assets of the corporation to the amount of $208,252,477. After paying all expenses, taxes, bonds, etc., a surplus of $29,940,780 remains. Gross sales for 1918 amount to $39,254,396 and gross earnings to $10,568,245.

As compared with the year ending Dec. 31, 1917, there is an increase of total assets amounting to $74,462,753, and an increase of gross sales of $4,433,870.

No Price Reduction for Six Months Is General Feeling

NEW YORK, Feb. 3—Judging from the attitude of the manufacturers of the cars exhibited at the show, it is quite certain that there will be no general reduction in car prices for at least six months. There have been only two or three instances of price drops in the last week. Almost without exception guarantees are being given against reductions. In some cases these guarantees are qualified to the extent that if there is a drop within the period of the guarantee the dealer will receive a refund of the difference in price. Those who are not so bold as to actually guarantee the price "assure" the dealers and the public that cars will not be cheaper.

July 1 seems to be the date generally fixed for the period of the guarantee, a very small minority being for 3, 5, 7 and 8 months.

Automotive Industries

Labor Situation Has Passed Crisis

Detroit Believes Surplus Will Now Gradually Work Off —Not Serious Now

DETROIT, Jan. 29—Manufacturers now believe that the labor situation in Detroit has passed its crisis and from now on the surplus of labor will gradually grow less. Many plants which have been running on skeleton crews are resuming operations on their old time scale. Two of the biggest Detroit companies, the American Car and Foundry Co. and the Lincoln Motors Co., will close down temporarily in a few days, however, releasing 6,000 men, but in spite of this setback, labor officials are optimistic.

That the unemployment situation is at its peak and that there will be no acute suffering unless unforeseen developments occur is the opinion of leading factory officials who met Tuesday, Jan. 28, in conference at the Board of Commerce. Figures presented at this meeting estimate that there are approximately 35,000 men out of work. The temporary closing of the two big plants will send these figures to 41,000, but from then on they will recede.

The situation is not as serious as the figures would indicate. Reports show that savings in the banks of Detroit are not only increasing month by month, but are increasing in a cumulative ratio, showing that money is not being withdrawn for current expenses as it would be in a serious unemployment situation. Another optimistic report from the unemployment standpoint was that one-half of the 5000 employees of the American Car and Foundry Co. are intending to "go back home," having been attracted to Detroit by high wages.

Manufacturers are getting large orders and receiving raw material which will shortly enable them to increase the number of their employees. Delay in the settlement of war contracts by the Government and a belief of business men that prices will come down, a belief which is not justified according to industrial leaders, are the two obstacles to the period of great prosperity. Action on Government contracts is expected shortly, while business men in general are beginning to realize that prices are going to stay up.

Soldiers returning to Detroit are not furnishing as serious a problem as was expected. Figures show that between 13,000 and 15,000 service men have returned to the city. Of these only 2750 have applied for employment at the Government office. Of these over 70 per cent have been placed. Of the thousands who have not applied for employment, the great majority have probably gone back to their old places.

To keep in constant touch with the situation, a combined committee of the Board of Commerce and the Employers' Association and other civic groups will be appointed.

Government to Use All Machines in Service

DETROIT, Feb. 4—Col. Edwin F. George, chief of the motors branch of the Purchase, Storage and Traffic Department of the army, Washington, today said that the Government had completed plans for the utilization of every car, truck and tractor now in service, and that in no event would machines be placed on public sale. Colonel George explained that the War Department will first decide on the number of machines required for the permanent army organization. The remaining trucks will be turned over to the Post Office Department, the Department of the Interior and other Government departments. What trucks then remain will be placed at the disposal of each State for agricultural, National Guard and other purposes.

Sale of Supplies Overseas Authorized

WASHINGTON, Feb. 4—An order issued to-day by General Peyton C. March authorizes the commanding generals of the American Expeditionary Forces to sell any war supplies, including motor trucks, passenger automobiles and motorcycles, to concerns, individuals or nations that were allied with the United States. These are to be sold by auction or by sealed bids when no longer needed for the Army. Reports of sales are to be made monthly. No materials or supplies are to be sold for less than their invoice price, including cost of inspection and transportation. Some restrictions in sales are made on guns and railways and immovable property.

Commerce Motor Car Official Dead

DETROIT, Feb. 4—George J. Kellogg, for eight years secretary and treasurer of the Commerce Motor Car Co., died Sunday at Grace Hospital, following an operation. He was an official of the Commerce company from its incorporation.

82,436 Overlands in 1918

TOLEDO, Feb. 4—The Willys-Overland Co. turned out 82,436 cars in 1918, as compared with 140,002 the year before. In addition, the company completed 42 per cent of its war orders, totaling $80,000,000.

Validating Bill Is Passed

Senate Approves Measure to Relieve Contractors—Several Amendments

WASHINGTON, Jan. 31—The bill to provide for payment of informal contracts has been passed by the Senate. It will now go to conference and then probably be reported to the House.

The bill passed is the one drawn up by the War Industries Board and advocated by the United States Chamber of Commerce, the Motor & Accessories Manufacturers' Association and other industries, although the bill as originally approved by these bodies did not contain the numerous amendments that have since been added.

The act authorizes the Secretary of War to waive non-compliance with the law in the matter of the irregularly made contracts. It creates a commission composed of three members, representing the War Department, Department of Justice and a third the business interests of the country. Concerns or individuals who are dissatisfied with the decision of the Secretary of War can appeal to the commission.

A provision authorizes the Secretary of War to secure satisfactory evidence that subcontractors will be properly paid before making payments to prime contractors. Reports of all operations under this act must be filed with Congress before the first Monday in December of each year. Following is the complete bill:

(*Continued on page 339*)

Additional Aero Banquet Guests

NEW YORK, Feb. 5—Coming with Lieutenant Fonck as representatives of the French Government at the Aero banquet on Feb. 19 are Sub-Lt. Charles Nungesser and M. Esnault Peltrio, one of the foremost French engineers and president of the Airplane Manufacturers and Industries in France. He will discuss the development and possibilities of the airplane for commercial uses.

Westcott Has a Lighter Six

SPRINGFIELD, OHIO, Feb. 2—The Westcott Motor Car Co. is working on a new model, a lighter six, and it is hoped that it will be ready in time for the Atlantic City Show the latter part of this month. The new car does not differ radically from the heavier six, which is now going through, but is more or less a small edition of it. No price has as yet been set, and it is not expected that this detail will be made public till the car gets

into production. The salient features include a Continental 3¼ x 4½-in. six-cylinder engine, automatic thermostatic water regulation, Fedders radiator, Delco ignition, Borg & Beck clutch, Brown-Lipe gearset, Hotchkiss drive, Timken axles and a Stewart vacuum fuel feed system. Grease cups have been entirely eliminated from the car, and every part requiring lubrication is supplied with oil fed by wicks. The tire equipment is 33 x 4 both front and rear, and the standard finish on the body and wheels is green.

—

Freight Rates to United Kingdom

WASHINGTON, Jan. 30—The United States Shipping Board has made public to-day the following rates of freight from the United States North Atlantic ports to Liverpool, London, Manchester, Hull, Avonmouth, Bristol, Cardiff, Glasgow, Leith and Belfast on a list of commodities which included:

Agricultural tractors $1 per 100 lbs. or 50 cents per cu. ft.

Auto trucks, $1 per 100 lbs. or 50 cents per cu. ft.

Ball bearings, $1 per 100 lbs.

Gas engines as parts of agricultural tractors or not as parts of agricultural tractors, $1 per 100 lbs. or 50 cents per cu. ft.

Other automotive products or materials not enumerated take a rate of $1 per 100 lbs. or 50 cents per cu. ft., ship's option:

—

Simplify Import List

WASHINGTON, Jan. 30—Individual import licenses will no longer be required for the importation into the United States from the United Kingdom, France, Italy, and Belgium and their European and Mediterranean African possessions and protectorates of any automotive commodities except the following: Naxos emery, naxos emery ore, ferro-manganese, spiegeleisen, nitrates, tin, tin ore and tin concentrates, or metals containing over 5 per cent tin.

It was also announced by the Board that all commodities imported into Alaska, Guam, Hawaii, Tutila, Porto Rico, the Virgin Islands, the Canal Zone, and the Philippine Islands may now be transshipped to destinations other than the United States.

All such relaxation of import restrictions, it was stated, will expedite import shipments and will tend to restore the entire import trade to normal conditions.

Thompson Elected Head of M. A. M. A.

President of Steel Products Succeeds Stiger—Broadwell First Vice-President

CHICAGO, Feb. 3—Charles E. Thompson, president of the Steel Products Co., Cleveland, was elected president of the Motor and Accessory Manufacturers' Association at a meeting of the Board of Directors Thursday afternoon, Jan. 30. He succeeds C. W. Stiger, Chicago, president of the Stromberg Motor Devices Co. The directors chosen were: E. P. Hammond, president of the Gemmer Mfg. Co., St. Louis, and G. W. Yeoman of the Continental Motors Co., Detroit. Other officers elected included: first vice-president, E. A. Broadwell, vice-president Fisk Rubber Co.; second vice-president, Christian Girl, president Standard Parts Co.; third vice-president, W. O. Rutherford, vice-president B. F. Goodrich Co.; treasurer, L. M. Wainwright, president Diamond Chain Co; secretary and assistant treasurer, T. J. Wetzel, Precision Castings Co.; manager, L. M. Bradley, and assistant manager, L. M. Heminway.

The afternoon meeting was a business session at which the retiring president delivered an address.

The evening session constituted chiefly the banquet in the gold room of the Congress Hotel and was attended by about 400 members.

—

Lieut. Fonck to Represent France at Aero Banquet

NEW YORK, Feb. 1—It is understood that Lieut. René Fonck, the leading French ace, who is also the premier ace of the world, will represent France at the Aero Club of America banquet on Feb. 19. At the request of the Foreign Service Committee of the club, he has been granted permission by the French Government to represent it, and is preparing to come to the United States at once.

—

$1,096,114,908 Spent for Air Service

WASHINGTON, Feb. 1—Total disbursements by the Bureau of Aircraft Production and the Division of Military Aeronautics amounted to $691,503,165 to Dec. 1, 1918, and outstanding obligations incurred to that date and not paid were $404,611,742, according to a statement of military appropriations filed with Congress yesterday. These expenditures allow a remaining $463,532,925 as the balance of appropriations not required.

According to the same report the Ordnance Department disbursed $25,771,-912.91 for armored motor cars to Dec. 1, 1918, with outstanding obligations for the same product totaling $79,584,252.82. Appropriations of $406,640,000 allowed for armored motor cars by the acts of July 9 and Nov. 4, 1918, were untouched.

Below is the statement of the Division of Military Aeronautics and the Bureau of Aircraft Production.

Detroit-Pittsburgh Airplane Express Route Advocated

DETROIT, Jan. 31—Automobile and other automotive industrial companies are asked to guarantee sufficient business to permit the establishment of an airplane express route between Detroit and Pittsburgh this spring. The Detroit and Pittsburgh Boards of Commerce have endorsed a plan submitted by Lieutenant B. Vernon, Flying Field, Philadelphia, for the immediate establishment of such a line, providing sufficient business can be secured. Lieutenant Vernon proposes to operate two planes, one to fly from Detroit to Pittsburgh and the other from Pittsburgh to Detroit, stopping at all intermediate cities. Discounting time required to make principal stops, a machine leaving Detroit at 10.30 a. m. will reach Pittsburgh at 3.30 p. m.

The proposed air express company will carry express for $1.78 a pound, subject to a 40 per cent discount if a satisfactory amount is sent at one time.

—

Le Pere Planes at Bolling Field

WASHINGTON, Jan. 30—Two of the latest type American-made scout planes, the Le Pere, have arrived at Bolling Field for test flights. These are the first two planes of this particular model made in the United States and were designed for use of American aviators at the front. It was stated at Bolling Field last night that these planes are equipped with the latest mechanical devices, having a balanced elevator and great speed.

The airplanes are camouflaged green, blue and white, and have 12-cylinder Liberty engines. The planes, it was stated, weigh approximately 3500 lbs., with a wing spread of 24 ft. They can climb 22,000 ft. and attain a speed rate of 135 m. p. h.

—

Hawkins Reported in Combine

NEW YORK, Feb. 6—A great consolidation of passenger car, truck, tractor and parts makers to be headed by Norval A. Hawkins, former sales manager of the Ford Motor Co., will shortly be completed, according to persistent reports. New York financiers are said to be behind the deal which it is understood is practically completed now.

Big Drop in Automotive Exports for Calendar Year 1918

Figures Maintained for Fiscal Year Ending June 30, but a Net Loss of Over $15,000,000 Incurred in Last Six Months

Totals by Months, 1918

December	1,703	$2,203,027	896	$2,636,689	$2,191,511
November	2,226	2,576,622	974	2,709,362	2,166,719
1917					
December	6,442	$5,380,702	807	$1,592,881	$4,952,615

Totals by Calendar Years

	Cars	Value	Trucks	Value	Parts
1918	36,936	$36,278,292	10,308	$26,814,952	$33,607,050
1917	65,576	51,872,905	14,479	36,755,236	31,624,963
Loss or gain in 1918	—28,820	—$15,594,613	-4,171	—$9,940,284	+$1,982,087

WASHINGTON, Jan. 31—When considering the matter of exports it is advisable to remember that the Government fiscal year ends on June 30 in each year and that for this reason it frequently happens that misunderstandings arise in connection with figures covering the Government year and those relating to the calendar year.

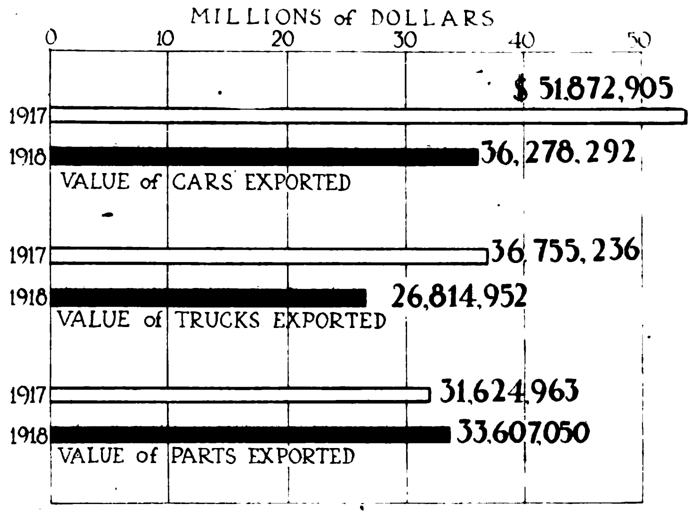
In the table herewith the totals are those of the calendar year, the figures for the fiscal year 1918 having been published in AUTOMOTIVE INDUSTRIES of Aug. 8. A comparison of these two sets of figures is of interest, especially at this time of reconstruction and consequent partial derangement of manufacturing programs.

Turning to the totals covering the fiscal year ending June 30, 1918, and segregating those referring to cars, trucks and parts, it is found that our total exports for the Government year were valued at $110,106,505 for 1918 and $118,377,047 for 1917, showing a drop in 1918 of $8,270,542.

Taking calendar year totals on similar items, as shown in table herewith, the values are $96,700,294 for 1918 and $120,253,104 for 1917, an apparent gross falling off of $23,552,810, or, deducting the fiscal year drop, a net loss of $15,282,268 on the year ending Dec. 31, 1918.

However, this is hardly an accurate way of determining the position, for it assumes that our export figures ran 50-50 during the first six months of 1918, a period common to both methods of computing the year's totals. It is quite conceivable that the loss occurred during the last six months of 1917, a period included in the 1918 fiscal year. At the same time there are regrettable indica-

Chart illustrating the drop in exports of cars and trucks and the slight gain in parts as between the calendar years 1917 and 1918



Exports of Automotive Equipment for Twelve Months Ending December, 1918

	Month of December				Twelve Months Ending December

tions that our export trade in cars and trucks has been on the down-grade for some months.

This apparent fact should not be accepted as an indication that our export business is leaving us permanently. It is rather a sign that circumstances and conditions quite outside of the automotive industry are not propitious for the time being. We are handicapped in our foreign trade at the present time by the state of national unrest existing in practically every country in the world, we find it hard to sell cars and trucks to countries which have no gasoline and but few available tires, and our difficulties do not end here.

The process of reconstruction on an improved ante-war basis is the big subject which is occupying the majority of our best customer countries to-day, and until commercial relations can assume a condition more nearly approaching normal it is too much to expect that our automotive export business will start in breaking records, as in 1916-17 and the earlier part of 1918.

Decrease in Canadian Motor Imports and Exports

WASHINGTON, Feb. 3—During the year 1917 there were in Canada eleven automobile manufacturers, twenty automobile accessory manufacturers and 497 repairshops, according to a report made by the United States Consul General at Ottawa. The capital invested in these industries was divided as follows: $28,192,858 in automobile manufacture, $3,155,893 in accessory manufacture and $4,431,926 in repairshops, making a total investment of $35,780,677.

Materials to the value of $35,585,820 were used in the manufacture of automobiles, $3,788,308 in accessories and $1,961,773 in repairs. The value of automobiles produced was $54,466,273, of accessories $6,495,868 and of repairs $5,091,066, making a total for the year of $66,053,207. The number of different types of cars produced, classified according to purposes, were: Touring cars, 80,544; runabouts, 5502; closed cars, 1231; club roadsters, 561; trucks, 117, and unclassified, 1721, or a total of 89,676.

The number of automobiles exported during the 12 months ended October, 1918, was 8044, valued at $3,692,524, against 9349, valued at $4,504,772 during the preceding 12 months. The value of automobile parts exported during the same periods was $1,202,055 and $1,523,678 respectively. Imports of motor cars during the six months ended September, 1918, amounted to 5689, valued at $5,018,941, and parts to $3,511,077, compared with 11,171 automobiles, valued at $7,870,377, and parts at $3,698,140, imported during the six months ended September, 1917.

The following table shows the number of employees on a wage basis in each class and the amount paid them:

Industry	Males	Females	Wages
Automobile plants..	4852	164	$4,862,779
Accessory plants...	1405	122	1,198,596
Repairshops	1508	34	1,200,958
Totals............	7765	320	$7,262,333

December Exports from New York

Parts Show Gain for Month, but Exports of Both Cars and Trucks Have Dropped

NEW YORK, Jan. 31—Exports of cars, trucks and parts from this port for December, 1918, represented in value approximately 50 per cent of the total car, truck and parts exported from all United States ports during that month. This proportion is rather under the mark, as New York is usually credited with around 60 per cent of the country's exports.

The increases shown in car and truck export figures for November were not maintained during December, the former dropping in number from 806 to 740, but showing a slight gain in value, the figures being $1,003,416 and $1,020,126 respectively. Four hundred and thirty trucks, valued at $1,564,293, were exported in December, as against 549, valued at $1,733,489 in November. On the other hand, parts have shown a gain, the December figures being $898,513, as compared with November's $593,414.

December's list of buying countries is somewhat restricted, as compared with those of the previous month, no shipments having been made to over a dozen which figured in the November table. When considering exports from New York to such places as Australia, New Zealand, Japan, etc., it should be noted that many shipments are made to these and other Oriental countries from Pacific ports. For example, Australia shipped 140 passenger cars from New York during December, but she also shipped 114 from other United States ports.

To Relax Export and Import Restrictions

WASHINGTON, Feb. 3—Further relaxation of restrictions and simplified procedure will be made shortly by the War Trade Board for the benefit of American exporters and importers. The method by which exporters were forced to procure individual export licenses during the war will be abolished as quickly as possible and a general license permitting the export of specified commodities to specified destinations will be issued instead wherever possible. This policy will be specifically applied to export shipments to the United Kingdom, France, Italy or Japan and their colonies, possessions and protectorates, Belgium and the Belgian Congo, Canada and Newfoundland.

New and Simplified Import License

WASHINGTON, Jan. 25—A new general import license, to be known as PBF No. 31, has been issued by the War Trade Board to cover all shipments of unrestricted commodities in transit through the United States where shipment from abroad is made after Jan. 21, 1919. This license does not relieve shipments of commodities in transit of the necessity of complying with whatever regulations are in operation and cover such shipments at the time.
